BUILDING.

Nothing useless is, or low;
Each thing in its place is best;
And what seems but idle show
Strengthens and supports the rest.

For the structure that we raise
Time is with materials filled;
Our to-days and yesterdays
Are the blocks with which we build.

VOL. LXI.

JANUARY TO JUNE, 1899.

LONDON:

PUBLISHED AT IMPERIAL BUILDINGS, LUDGATE CIRCUS, E.C.

THE
ARCHITECT
AND CONTRACT REPORTER.
A JOURNAL OF ART, CIVIL ENGINEERING & BUILDING.

THE WEEK.

FOR over thirty years "175 Strand" has served as the publishing offices of *The Architect*. The connection between the two is, therefore, close in the minds of our subscribers and of the public. If it has to be severed even temporarily, there will be regret, for we have reason to be proud of our success, and naturally associate a part with the building. But improvements cannot be stayed in the Strand any more than elsewhere. The whole block of which No. 175 is a part has to be rebuilt, and there must be at least a temporary removal. We shall, therefore, occupy our city offices at Imperial Buildings, Ludgate Circus, which many consider to be the most central position in London, as a substitute, and we are confident that our friends will not in any way suffer inconvenience beyond having to change the address of their letters to us. There we hope to have a continuance of the same success which has hitherto attended us, and we are sure our supporters will give us their good wishes. For our part we sincerely desire that the closing years of the century may bring them happiness and prosperity.

SCOTTISH law differs in many ways from what is exercised in the South, but it is satisfactory to find that the equitable principle of permitting the architect to act justly is equally recognised in both. A builder lately sued a parish minister in the Kirkcaldy court for 73*l.* 8*s.* 9*d.* for work done. In the contract it was stated that the work was to be done to the satisfaction of Mr. LITTLE, architect. He declined to give his certificate until the contract was complete in all details. The builder complained that the architect was "unreasonable and faddy," and said that while doing the work he suffered from needless and vexatious interference. The minister expressed willingness to pay as soon as the certificate was produced, but not before. Then proceedings were taken. After hearing the evidence the case was dismissed. In the usual note or explanation of his decision, Sheriff GILLESPIE, the judge, wrote as follows:—"The substantial question raised is, whether the pursuer is entitled to get behind the architect named in the contract. His averments must be closely scanned. He does not aver that the defender has influenced Mr. LITTLE in refusing a certificate. Even the grounds stated against Mr. LITTLE are slender. The gist of the pursuer's complaint is that Mr. LITTLE had insisted on exact compliance with the terms of the contract — in other words, that Mr. LITTLE has done his duty as an architect. Then he goes on to say that Mr. LITTLE has been fanciful in his requirements — which is a matter of opinion. I am not prepared to say that a contractor would have no remedy if the architect persistently refused to grant a certificate without stating what was wrong with the contractor's work and what he required to be done. There are some allegations in the pursuer's condescendence (pleadings) which, read by themselves, might suggest such a case; but it is tolerably plain from the condescendence itself, read as a whole, and still more plain from the correspondence in process on which pursuer finds that he knew quite well what Mr. LITTLE wanted. He had, no doubt, considered that Mr. LITTLE was 'unreasonable and faddy,' but it is a different thing from ignorance of what he wanted. After stating his requirements, Mr. LITTLE was not bound to state them over again." That is a satisfactory conclusion, but in days when knowledge is so widely diffused in Scotland, a builder should not have to undergo the expense of discovering what is an architect's duty.

THE intention to expend 300,000*l.* at least on a lunatic asylum for East Sussex alone—in the western division of the county there is a similar building in progress—may cause Sussex to be called silly instead of stupid. The truth is lunacy is a growing evil and, like the majority of railway stations, the county asylums have been planned without a recognition that the future must be considered rather than the present. The county asylum at Hayward's Heath, which was supposed to be adequate for the whole of East Sussex, is to be taken over by Brighton, to provide for the impending needs of "the queen of watering-places," and we suppose an expert would say the arrangement was prudent. In the new asylum there will have to be arrangements for the classification of patients according to the varieties of disease, and for allowing some degree of liberty to selected patients. The new asylum is to be very plain in character, and the average cost of 275*l.* per bed will be consequently reduced to 267*l.* It is expected that the total outlay will not be more than a rate of $1\frac{3}{4}d.$ in the £, and if paying patients can be attracted the rate may be reduced to $1\frac{1}{4}d.$ in the £.

EFFORTS are made in the United States to make known the wealth which exists in the country in beautiful marbles and other ornamental stones. At the recent convention of architects specimens of onyx, alabaster, porphyry, catlinite, verd antique, pegmatite, &c., were exhibited. They were admitted to be equal in quality not only to the varieties which are now obtainable from foreign quarries, but to the ancient specimens found in museums. Professor MERRILL, who introduced and described the specimens, was, however, compelled to own that the American products were handicapped by the cost of production. He told the architects how "the high prices now put upon skilled labour, and enforced by labour unions, have in our country very largely counteracted the cheapening of methods of transportation through the introduction of steam-power. Indeed, owing to the cheapness of foreign labour as compared with that of the United States, the Italian materials will to-day compete on equal terms in our Eastern markets with those of the United States; and were it not that modern ingenuity has called into play a score of mechanical devices whereby the labour of one man is multiplied many fold, it would be impossible for any but the very wealthiest of our people to indulge their taste in any but the most commonplace of art objects made from domestic materials so obdurate as stone." One of the consequences was that scarcely one of the stones he displayed was to be found at present on the American market. The Americans, who have a weakness for beautiful varieties of stone, must be thankful that in Italy and elsewhere in Europe trades unions are not encouraged by Government as they are in the States.

REMBRANDTS AT THE ROYAL ACADEMY.

IT is disputed whether REMBRANDT visited England, but the number of his works in Burlington House is evidence of the remarkable attraction he has exercised upon collectors. Over a hundred of his oil-paintings were lent, besides sketches, and the thirtieth winter exhibition of the Royal Academy is confined to them. It is needless to say many more of REMBRANDT'S works are to be found in this country, but those selected are sufficient to suggest the greatness of the master. If we bear in mind that according to BODE there are only 377 paintings by him in existence, of which number Holland has but twenty, the value of the exhibition will be more apparent.

As usually happens in these exhibitions the Academicians appear to be indisposed to turn the treasures confided to them to the best account. Ideas are not much valued in Burlington House, and to suggest that a collection of paintings can be arranged in such a way as to establish a principle would be an absurdity to the academic mind. A picture is supposed to be a piece of coloured canvas of a certain size in a frame, sometimes longer than broad, sometimes with more breadth than length. To place a big canvas in a central space, to arrange a certain number of others of corresponding forms on each side is considered the perfection of hanging. Whether there is any relation between the pictures or whether they will bewilder a spectator by their variety is of no concern. The sizes of the frames are of more importance than the subjects.

For REMBRANDT especially there could not be a worse arrangement of his paintings than that commonly adopted in the Royal Academy, for it is fatal to the personal note which his works can be made to express. He must be considered as the most egotistic of all painters. Whether he was right or wrong in forcing himself on our notice we need not inquire, but we cannot appreciate his works properly if we lose sight of him. The numerous portraits of REMBRANDT are revelations of his moods from time to time, and his own feelings were a guide to the interpretation of those of his subjects. The Academicians have been fortunate in obtaining about a dozen of those portraits which are like pages from an autobiography, but as they were judged by the dimensions of the frames they are found scattered through several galleries instead of being placed in succession together as their character demanded. Or, if that arrangement was considered too simple, then one of the artist's portraits could be placed amidst the works which were produced about the same time. The Academicians did not, however, realise that REMBRANDT'S portraits were of any more importance than those of the rabbis and burgomasters, and in consequence the exhibition fails to express not only the man, but the artist, as would have been possible if a satisfactory idea inspired the hanging.

That REMBRANDT did not make a subject of himself for his own gratification alone is evident. But we cannot now understand how or why the portraits should have market value. If any of the Royal Academicians tried to imitate his practice, we are afraid the likenesses would not be in demand. REMBRANDT could represent himself in oils or with his etching-needle without any apprehension of wasting his time. His contemporaries, we suppose, found as much pleasure in the portraits as Frenchmen some years before discovered in MONTAIGNE'S revelations of himself. The Dutchmen were pleased when they saw their great portraitist with his wife on his knees, with one hand round her waist and an immense glass in the other, or staring as if in fear, or laughing as if for a wager, or smiling as if proud of "the three moustaches." In the Academy exhibition we are not fortunate in having humorous portraits of the painter, but those on the walls are not monotonous or conventional.

We begin with one painted in 1632, when the artist was in his twenty-fourth year, for the archives record his birth as an event of 1608 rather than of 1606 or 1607. It is evident from the sweetness of the expression that REMBRANDT was then happy. He was living in Amsterdam, and as in 1632 he had produced his wonderful *Lesson in Anatomy*, which is now in The Hague, his supremacy was acknowledged. In a portrait of 1637 he appears as a gentleman who is at ease and to whom fate was kind. REMBRANDT had married "SASKIA" in 1634 and received a large fortune with her. Her face was as favourite a subject to him as his own. It is believed by some critics that the girl whose presence illuminates the so-called *Night Watch* by her face as much as by her dress and jewels, is "SASKIA," and as she died in the year the picture was painted, the mysterious figure might be a symbol of the light-bringer who shed a radiance over eight years of the artist's life, and whose departure was destined to be followed by a long period of gloom. REMBRANDT loved to see his wife adorned as an Eastern princess, and in the Duke of BUCCLEUCH'S picture she appears as a phantom of delight in gorgeous raiment, her head crowned with flowers and bearing a wand as if she were an enchantress. As usual, she smiles and appears beyond domestic cares. In the second portrait on view she is more terrestrial, with her velvet dress, embroidered cloak, necklace, earrings and cross. REMBRANDT considered that "SASKIA" looked best in yellow, and from wearing a robe of that colour and from the quantity of jewels introduced, we believe it is she who appears in the so-called *Burgomaster Pancras and his Wife*, and that the title should be *Rembrandt and his Wife*. It belongs to the Queen. Her features were those of a Dutchwoman, that is to say, she was not endowed with Greek or Italian beauty, but on that account she was more comely in REMBRANDT'S eyes. There is a wonderful portrait of him lent by Lady DE ROTHSCHILD, which, according to the catalogue, was painted in 1656. We prefer to believe it was painted prior to "SASKIA'S" death. REMBRANDT appears in it as if he were a companion to his wife in some fête. There is so much that is Eastern about the costume and appearance of the man, it might be taken, if it bore no title, as a portrait of an actor who was about to appear as OTHELLO, but whose "make-up" was not complete. The face is grey rather than black or brown. The artist wears one of those large brown caps he admired, but it surmounts one that is close-fitting and which is crossed with stripes of colour.

After 1642 there is a change. The *Man with the Sword*, if a portrait of REMBRANDT, has none of the truculence we should expect from the owner of such a weapon. It is a quiet, subdued warrior who gazes at the spectator. Nor is there any trace of the roystering artist in the portrait from Buckingham Palace, although he wears a red vest inside his black cloak. In the portrait belonging to Lord ILCHESTER, which is dated 1658, the painter appears almost like an elderly rabbi, in a grand robe with a silver-topped cane which reflects much light, while in one painted in the following year he is evidently oppressed by time and care. REMBRANDT is an old and saddened man in Lord KINNAIRD'S portrait, while in one (No. 4) dated 1660 he appears to be seventy-two rather than fifty-two. A more pathetic portrait than the latter it would be difficult to find, for the very resignation it expresses reveals that fate has done its worst. Another portrait (No. 20) shows him as still painting, and there is a big circle introduced as a panel, by which he may have intended to suggest that his hand was firm enough to draw GIOTTO'S O, but the face is too adipose for a man who is vigorous. It is the last of the series, and, although the handling continues to be remarkable, leaves a melancholy impression on the observer. It is supposed to belong to the period between 1660 and 1665. On October 8, 1669, the great painter who, as BYRON says, "made his darkness equal light," was buried in a pauper's grave in the churchyard of the Westerkerk, at an expense of 15 florins to the congregation. The visitor should be enabled to compare these portraits without having to hunt after them through the various galleries. REMBRANDT has in them suggested the story of his life, and they lose much of their interest when they are distributed at random.

There are also materials to show his affection to his family. The portrait of HARMEN GERRITSZ, the painter's father, is painted with an elaboration which proves how delightful was the labour. Every hair appears at first sight to have a separate existence on the canvas, and the chain which he wears over his black robe, and was probably an insignia of office, might be painted by HOLBEIN. There is a small portrait of the artist's mother, which in execution resembles a miniature. A second which is exhibited must be a replica, and from REMBRANDT'S temperament we doubt whether he could attempt a copy without introducing something new. One or more of the numerous "old ladies"

may also be inspired by filial love. Of his sister we have four portraits. She was more regular in feature than "SASKIA," but she was adapted like one of the Misses FLAMBOROUGH to be represented as holding an orange; to show so quiet a girl grasping a dagger was one of her brother's pictorial jokes. A portrait of REMBRANDT'S son TITUS shows he was not more fond of study than the majority of little boys. We afterwards see him as a young man. He was not successful as a painter, and died before his father.

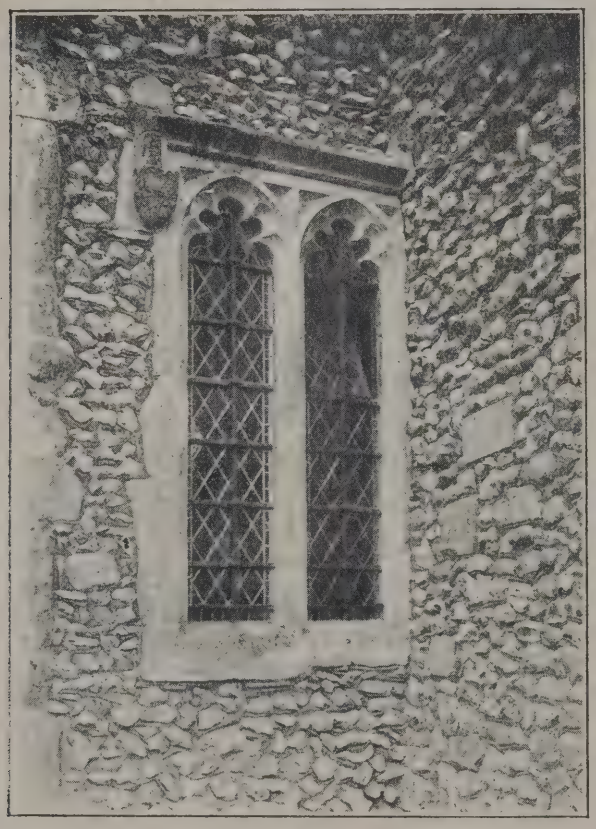
It is not only by REMBRANDT'S portraits of himself we are puzzled; his Scripture scenes also present a difficulty to the inquirer. For whom were they painted? There was no place for them in Dutch churches. On that account the very large *Deposition* belonging to the Duke of ABERCORN will give rise to doubt about its authenticity. In what Dutch house could room be found for so vast a work? If considered in its technique it seems to be derived from a study of Italian pictures, and the only part which has the characteristics of REMBRANDT'S manner is the fine head of JOSEPH of Arimathea, who bends over the SAVIOUR'S body. There is no effort to add dignity or mystery to the scene by means of chiaroscuro, and the endeavour to contrast lifeless flesh with a white sheet, which gained RUBENS a triumph, is shirked, although for REMBRANDT it would be likely to have irresistible fascination. Where the painter is most successful is in his small representations of Biblical scenes, especially those from the Old Testament, and which Jewish patrons may have commissioned. Whenever the large *Belshazzar's Feast* out of Lord DERBY'S gallery appears in an exhibition—it was first shown in London in 1821—it is sure to be abused. If it were not assumed to be one of his early works we should say it was left unfinished by REMBRANDT, or the paints may have faded, and the part where the handwriting on the wall appears has less of a contrast with the remainder of the picture than formerly. The Hebrew lettering is too prominent and perfect, and must be the handiwork of a sign-painter.

REMBRANDT was more at ease with cabinet pictures, and most of all in his etchings. He possessed engravings of famous Italian paintings which were found in churches, but he adopted a different mode of interpretation. He saw around him a display of wealth among his Jewish patrons, and he knew they believed that in their own land they possessed whatever the East could supply as an aid to luxury. Consequently in *Isaac and Esau* we see a bedroom rich in tapestries, gilding, cushions, which surpasses anything shown by DELAROCHE in the royal chambers of France. *Abraham dismissing Hagar and Ishmael* is not a scene to excite pity. The woman is "mounted on a richly-caparisoned donkey" which her son holds, and the patriarch appears to bid them good-bye, as if they are departing to one of his numerous properties. In *Joseph's Coat* JACOB is overcome by the sight of the garment and his grief is represented with much power, but the buildings in the background are signs of a very wealthy cattle-dealer.

The New Testament scenes could also be found in an Hebrew's house without being evidence of apostasy. It would be wrong, perhaps, to say there was a little of Mr. Facing-both-ways in REMBRANDT, but he is not definite in marking the difference between the two Dispensations. His etching, *The Death of the Virgin*, is a magnificent scene, which might have taken place in SOLOMON'S palace. In one of the etchings of *The Resurrection of Lazarus*, Our LORD is endowed with majesty, but generally the artist was disposed to indicate He was despised and abject among men. In the *Christ and Mary Magdalene at the Tomb*, which used to be known as *The Entrance to the Tomb*, or *Noli Me Tangere*, from the Royal Collection (it once belonged to the Empress JOSEPHINE), CHRIST appears in a broad straw hat and holds a spade. There is nothing to suggest the figure is more than mortal. It is in scenes like *The Tribute Money*, *The Circumcision*, *The Adoration of the Magi*, &c., where crowds can be introduced, and the figures are too little to excite theological questions, that REMBRANDT appears to have found most enjoyment. He could alter the buildings which serve as backgrounds to suit his requirements, and had no apprehension about breaking architectural or other laws. If compared with Italian representations of similar subjects, they do not appear to have had a common origin.

From the figures which appear in the Temple scenes to the portraits of the rabbis and other Jews there is no great distance. The difference is one of scale. With many of the men who sat for their portraits REMBRANDT must have had financial business, and his experience was, we suppose, like that of artists of later time. Some were generous, others exacting. There is only one man among the Jewish subjects who corresponds with SHYLOCK, and the painting comes from the Hampton Court collection. The portrait belonging to Earl BROWNLOW shows an invalid rather than a usurer. There are two portraits of an elderly rabbi in a gold-embroidered turban and dark robe, with a jewelled clasp, who looks like a man who had authority in Israel. It is hard to decide which is the original, for both are marvellous representations of a man who has disagreeable duties to perform, but has sufficient control of his feelings to execute them. Another richly adorned rabbi belongs to Lord DERBY, and many of the old men have Jewish physiognomies.

It is to be regretted that we do not know more about the subjects and their connection with REMBRANDT, for evidently the artist was most successful in painting the men and women whom he admired. There is *Dr. Bonus*, for example, whose diamond ring has gained a success which is not likely to befall the Koh-i-noor, for it inspired a masterly etching. In the oil picture the Doctor appears as a young man in a dark dress, with stripes that suggest silk, a cloak and high-crowned hat. If all the medical men of the seventeenth century resembled him, then the satirists must have wandered far from the truth, for he appears to have as much kindness and intellect as any London physician of our time. *Burgomaster Six* is another celebrity of the etchings, and he appears in the portrait as a young man with long fair hair in a black gown. The face is tenderly painted as if affection inspired the artist. All thought of effect seems to have been laid aside, and REMBRANDT painted his friend with the expression that he must have liked to see spread over his features. A third marvellous piece of characterisation is the portrait *Nicholas Berchem*, who appears as if uttering some sly joke or sarcasm that did not wound deeply. But there is nothing more vivid than the *Shipbuilder and his Wife*, which was painted by REMBRANDT in his twenty-fifth year. The old man must surely have drawn the section of a ship which is lying before him, and the half-resentful glance he casts at his wife when she interrupts his meditation by rushing in with a letter shows REMBRANDT'S very keen insight. A man of the same metal, to whom the sea was an instructress, is presented in the portrait belonging to Mr. FITZWILLIAM. Apparently the artist was less at ease before the women of that time, especially those who were not aged. They have an air of living up to their stiff costumes. Even Madame SIX appears to assert her dignity. A portrait of a lady from Buckingham Palace shows so much beauty that we cannot believe she is a Dutch woman, and an old lady seen in Captain HOLFORD'S portrait is so merry that she compensates for the pessimism that is seen in some of the other portraits.



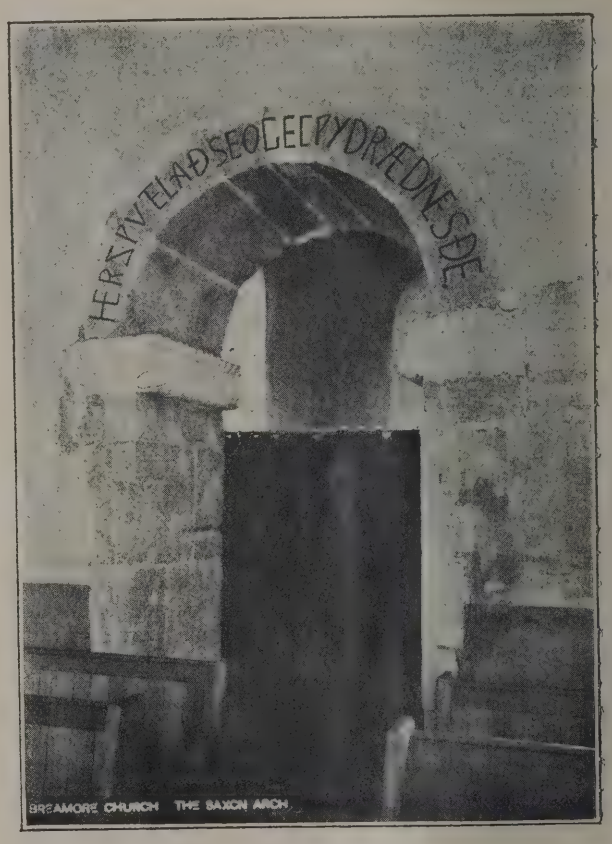
The Man in Armour, belonging to the Corporation of Glasgow, is undoubtedly a fine picture, but if REMBRANDT had once drawn such a helmet it would have appeared again and again among his figures. *An Orator*, belonging to the Duke of NEWCASTLE, shows nothing to bear out the title, and it might with as much propriety be called *A Poet*; but it is not a picture which would be recognised at the first glance as REMBRANDT'S. But in every exhibition of Old Masters we must expect to see doubtful works. There are a few landscapes, *The Mill* being the most important. Over two hundred sketches by REMBRANDT are exhibited, but the exhibition should also present examples of his etchings. By omitting them REMBRANDT is only partially revealed to the visitor; but the indifference is only a further proof of the perfunctory manner in which all the arrangements for the thirtieth exhibition were carried out.

Professor Gardner will deliver the first of a course of lectures and demonstrations on Greek vases, &c., at University College upon the 16th inst. at 4 P.M.

A PRIORY IN A VILLAGE IN FORMER TIMES.

By Rev. J. K. Floyer, M.A., F.S.A.

On the banks of the Avon, and on the borders of the diocese of Winchester and the county of Hampshire, stands the village of Breamore. The church is shown by recent investigation to be in substance of Saxon origin. An inscription, apparently recording the fulfilment of a vow, is carved in Saxon letters and language on a contemporary transept arch, and the general outline of the church is similar to that of other Saxon churches. Presumably its original establishment was due to the preaching of Birinus, first bishop of the West Saxons, who for fourteen years, beginning in A.D. 634, exercised his ministry in the kingdom of Wessex, and possibly crossed the river at Cerdic's Ford, now Charford, which is a mile from Breamore Church, and which had been the site of a great victory 115 years before of Cerdic over the Britons. Breamore then, with its Saxon church, most probably formed one of the earliest parishes of Birinus, though no part of the existing church is apparently of earlier date than the tenth or eleventh century.



And so it continued as the only recorded ecclesiastical institution of the parish until the twelfth century, when Hugh de Port and his nephew Baldwin de Redvers, Earl of Devon and Lord of the Manor of Breamore, followed the pious custom most highly esteemed at the time and founded a priory of Black or Augustinian canons in the parish,* a mile from the church and on the bank of the river. Baldwin was buried at Quarr, in the Isle of Wight, in another monastery which he had founded for the Cistercian Order.

The Priory of St. Michael of Breamore figures but little in history, but bears an important part in the ecclesiastical life of the parish. At different periods it acquired the right to impropriate the rectories of Breamore itself, of Rockburne, a few miles distant,† of Whitsbury, on the downs close by,‡ and of Bardyng (Brading), in the Isle of Wight.§ Hale, too, and South Charford, both chapelries of Breamore, came into the hands of the priory, and were served by those canons who were ordained.

* Tanner, *Not. Monast.* 1744, p. 162.
† Madox, *Formulare Anglicanum*, 1702, p. 22.
‡ Letters and Papers, Henry VIII. No. 1217.
§ Pat. Roll, 29 Ed. I.

It would be interesting to ascertain what proportion of the canons of this house proceeded to holy orders, but in the absence of any evidence as to the number which the priory contained at any one time, we can only say that in all probability a sufficient number were ordained to serve the churches under the charge of the monastic house, and to read the offices in the home chapel. In the seven years from 1316-23 there are notices of four Breamore canons receiving priests' orders, two others being ordained as acolyte and subdeacon in consecutive years, and a third couple passing through the subdiaconate and diaconate to the priesthood.* The number in the priory at the Dissolution was only nine,† and may never have been greater.

But their influence by the appropriation of rectories extended over a considerable area, though North Charford, which adjoins South Charford, had its independent church in the gift of the Prior of St. John of Jerusalem early in the fourteenth century, and never seems to have come under the control of the Breamore house.‡ North Charford is now extra parochial, has no church, and the tithe is paid to a layman. At Whitsbury the canon who was appointed to the rectory was bound to reside; but William Coke, who was instituted in 1321, was only in deacon's orders.

The priory served these churches perhaps better than the secular clergy, who, according to the accounts given by the monastic writers, were inclined on the whole to be negligent in their discipline. But while it did this, to a large extent it destroyed a prominent feature of early English church life, by taking away the responsible priests from their cures and causing the churches to be served by those who, if more diligent in their duties, were certainly unable by their common life, lived under rule apart from their parishioners, to keep the people so well in touch with the church. The two systems, originally supplementary one to the other, eventually became antagonistic. The parochial system promoted the limitation of territorial districts to the jurisdiction of one bishop, and the subdivision into parishes in charge of one responsible 'persona' or rector. The monastic system, on the other hand, tended to form centres of learning and piety with branches wherever they could be established, and where, as in the case of Breamore, it grafted itself upon the parochial system by the appropriation of

* Registers of Asserio and of Sandal. Edited by Baigent.
† Tanner, *Not. Monast.* as above.
‡ Bps. Regs. as above.

rectories, it practically crushed the life out of the system and supplanted it.

The Priory of Breamore, as the administrator of alms to the poor, and as the chief ecclesiastical power of the district, was undoubtedly much respected and esteemed. Its life was quiet and uneventful. In 1281 Archbishop PECKAM, the reformer of ecclesiastical abuses, was at Breamore,* and sixteen years later the king's agent came there on his round from Langley, offering protections and pardons to those who would contribute to the Crusade, and terrifying the monks with stories of enemies already landed in England, who had carried off sacred vessels and ornaments from the churches and barbarously murdered ecclesiastics and decrepit persons.†

being made on the site of the priory are found several stone coffins, arranged with some method, two at one end of a building and one in the middle, covered by a circular design in tiles made for the place where they are laid. The coffin to which this especial honour was given may have been the one which contained the bones of the Countess ISABELLA.

By the end of the fourteenth century the foundation of monastic houses had ceased all over England, and a great stimulus was given to secular church building, especially in the diocese of Winchester, by WILLIAM OF WYKEHAM, one of the great architect-bishops. The influence of this also was felt at Breamore. A little before A.D. 1400 Sir JOHN POPHAM was born,* probably at Southampton.

In 1296 died ISABELLA, Countess of Albemarle and sometime Countess of Devon. She was taken ill at Sutton, on her way from Canterbury, and was taken to Stockwell, where she died.‡ Brother WILLIAM DE GAYNESBURGH, who had been her confessor for four years previously, attended her, and her body was taken to Breamore Priory and buried there.§ The prior was one of her executors, and the advowson of Brading in the Isle of Wight was transferred to the priory, that prayers might be said at Breamore for her soul.‖ Among the excavations which are

Now it has not infrequently happened that of two historic personages bearing the same name and exercising much the same functions, one has entirely obscured the other from public view. Sir JOHN POPHAM of Hampshire requires to be carefully distinguished from Sir JOHN POPHAM of Littlecote. From the romantic stories connected with the acquisition of the Littlecote property and the crime of DARRELL, which have been stamped with the authority of Sir WALTER SCOTT and MACAULAY, the attempt to work in the ballad of the "Green Lady" as part of the POPHAM history instead of that of the BOLLES family, the tradition that Sir JOHN POPHAM, as Lord Chief Justice of HENRY VIII's.

* Cf. Art. in *Dict. of Nat. Biog.*

reign, hung in later years the thieves in whose company he had formerly picked pockets on Tower Hill—these and other incidents, none of them possessing more than partial truth, and some of them without a trace of it, have hitherto concentrated the glance of public interest on the more romantic if not more illustrious figure of the two bearing the same name.

Sir JOHN POPHAM, sen., for he lived a generation before the Chief Justice and was but a distant cousin, was in 1415 constable of Southampton, where his family had hereditary possessions. In this capacity he had the custody of the Earl of CAMBRIDGE and others engaged in the conspiracy to assassinate HENRY V. on his embarkation with 1,500 ships for the French wars. POPHAM himself subsequently embarked with thirty men-at-arms and ninety archers, and soon distinguished himself as one of HENRY'S most prominent followers in the conquest of Normandy, and received honours and rewards. Continuing in the French wars under the Duke of BEDFORD he was made Chancellor of Anjou and Maine and Captain of St. Susanne.* After the Duke of BEDFORD'S death he was appointed to serve on the Duke of YORK'S Council in Normandy, and in 1437 made Treasurer of the Household to King HENRY VI. Upon this he added a bezant to his paternal coat of arms of two bucks' heads.

On March 19, 1439, he set out on an embassy to the Earl of WARWICK in France, and also to make a treaty with the "bastarde of Orlyance" in Brittany. On his arrival at Cherbourg on his return home he was met by messengers from the king, in consequence of which he went to Rouen and waited there until the end of August, when he was employed by the king to make terms for the truce. POPHAM did not relish the prolonged stay in France, and when permission to return was sent him on the last day of September, he "shope hymne into Engdondewarde in the goodliest hast that he might, and spede hymne in sech wyse that, blest by God, he comme to Londone agene the xx day of October,† after being absent 200 days." After this he retired from his warlike life and sat as member of Parliament for his native Hampshire in 1449. He was chosen Speaker of the House of Commons, but begged the king to excuse him on the ground of the infirmities of an old soldier and the burden of advancing age. His request was granted, and WILLIAM TRESHAM appointed in his stead.‡ He died on April 14, 1463.§

His part in the ecclesiastical history of Breamore has partly been brought to light by the discovery of a Service-book in the British Museum.‖ The accounts of the foundation of parish churches in the Middle Ages are so rare that it is worth while recording in detail his contributions to the building of churches.

The Service-book mentioned above records that the "parish church of South Chardeford, together with the burying-ground, in the diocese of Winchester and the county of Southampton, was dedicated on the festival of St. AGNES THE VIRGIN (January 21), A.D. 1404,¶ by NICHOLAS, by the Grace of GOD bishop of CHRISTOPOLIS, which NICHOLAS aforesaid had full power from THOMAS ARUNDEL, venerable lord and father in CHRIST, then Archbishop of CANTERBURY, during the vacancy of the see of Winchester after the death of the venerable father, WILLIAM of WYKEHAM, sometime Bishop of WINCHESTER, and this at the instance of Sir JOHN POPHAM, Lord of Southchardeforthe, at his own cost and expense, with the assent and consent of brother JOHN LONDON, at that time prior of Bremmore and of the convent of that place. Also the said NICHOLAS has granted to all truly contrite and humble faithful entering and going round the aforesaid burying-ground and saying Pater Noster and Ave Maria in pious devotion for the faithful departed, forty days' indulgence, as often and so often as they shall begin and finish this holy work. Besides this, the said Sir JOHN POPHAM devoutly asks that all and every one shall devoutly pray GOD for the salvation of his soul, and the souls of all benefactors of this place, past, present and future, having charity in mind."

§ Brass at St. Lawrence, Reading.
‖ Bibl. Reg. 2A xxi. 8.
¶ Old Style. Wykeham died September 27, 1404.

In the beginning of the book is another inscription, which may be translated as follows :—

Memorandum.—That in the year of our Lord 1408, Sir John Popham, of the county of Southampton, provided and freely gave this book to the parish church of Southchardeforth on the festival of the Purification of the Blessed Virgin Mary. All who look on this volume shall piously pray to God for his soul and for the souls of their benefactors. And he who shall alienate this book, the anathema of God, of the Blessed Mary, and of all saints shall cleave to him for ever. Amen, in mercy.

The volume in question is a Manual, and contains five Offices, four of them parochial, the other a processional one: —1. The order of baptism. 2. Benediction of the fire. 3. Order of matrimony. 4. The visitation of the sick. 5. Mass for the dead and office for the vigils of the dead.

The benediction of the fire was part of the great ceremonial of Easter Eve, and is contained in the Sarum Processional, where it is most carefully described. In addition to the foundation of the parish church at South Charford, a mile from Breamore Priory, POPHAM made additions to the parish church of Breamore. At least two south windows are of his construction. They abut on the walls of the Saxon transept on either side, and the stone weathering over the head of each is designed as though the transept did not intervene, but that the windows were one. On a shield at the western terminal are the Popham arms, POPHAM and SOUCH quarterly, with the bezant of the king's treasurer; at the corresponding terminal eastwards is the head of a bishop, possibly intended for WILLIAM WYKEHAM.

POPHAM also built the south porch, the tower, and made several other additions to St. Sepulchre's Baily, in London,* where his statue formerly stood in the position now occupied by a bay window in the parvise. A curious fatality attended the works which should have been his memorial. St. Sepulchre's was a good deal burnt in the Great Fire of London; the church of Charford fell with the priory; the very brass which once recorded his dignity in the cloisters of the Charterhouse in London was taken away at the Dissolution, and in 1528 made to serve for the epitaph of one WALTER BARTON at St. Lawrence's Church, Reading,† where still it hangs as a palimpsest. Here POPHAM is called "sometime Lord of Tournay, in Normandy, and Lord of Chardeford, of Dene, of Alvyngton and elsewhere, in England," &c.

Breamore Priory then wove itself into the fibres of the parochial system, not only by the appropriation of the rectories, but by causing the new parish church which was founded to be placed indirectly under its charge. We shall see further how the legislation of HENRY VIII., by wounding the creeper wounded also the stock, and in the abolition of an alien institution practically exempt from episcopal jurisdiction, and a supporter of the POPE'S claims, injured that which it had encircled and appropriated.

WILLIAM FYNCHE was appointed prior of Breamore before 1530. In that year he represented the Abbot of Netley in the obsequious Convocation‡ which granted the king 100,000*l.* under penalty of Præmunire, and acknowledged the king's supremacy. FYNCHE served the king at the expense of his priory. In August 1533 he wrote from Breamore to THOMAS CROMWELL, "If there be anything in their poor house to pleasure CROMWELL it shall be at his commandment," and again two years later he wrote to the same purpose.‡ The priory was dissolved in 1536, and FYNCHE received a pension of 18*l.*, which was taken away on his appointment in 1538 as first bishop suffragan of Taunton, on the nomination of the Bishop of BATH AND WELLS.§

The priory was granted in 1536 to HENRY, Marquis of Exeter, with all the manors, advowsons and other ecclesiastical property it had acquired. The Marquis for some time kept a servant to receive the dues, and there are indications in the recent excavations that the buildings were used for other purposes than their original ones, so that they were most likely used for farm purposes and eventually destroyed or left to decay.

‡ Letters and Papers, Henry VIII.
§ Syll. of Rymer's *Fœdera*. (Fynche is here incorrectly described.)

Breamore, Hale and Rockbourne became donative rectories. The church at Charford, being an encumbrance on the rectory of Breamore, was destroyed in the last or preceding century. The tithe is still partly paid to Breamore and partly to the neighbouring donative rectory of Hale.

Hale, which was in 1534, like Charford, a chapelry of Breamore,* may have for a time shared the same fate with regard to its church, but it was rebuilt, it is said, from the designs of Sir CHRISTOPHER WREN,† and is still served as a rectory. Brading is registered in the king's books as a lapsed vicarage. Thus the monastic system in Breamore came and went, possibly on the whole a beneficent institution, offering at times in its history an example of a religious life, and being to some extent a bulwark against the various spoliations and taxations which would otherwise have fallen more severely upon the parish churches. But the parish churches saw it come and saw it go, being in number after the Reformation, until Hale was rebuilt, exactly what they were when the priory was founded, though in one or two cases mulcted of their revenues and changed as to their administration. The additions they received to their fabrics or their revenues were, so far as may be discovered, entirely the work of private benefactors, and not due to the instigation of the monastic system. The parish system was content to contribute to the support of a guest which came under good auspices, which assumed for a time control of the household, and which departed, taking some of the property of the house with it. The experience of the past is the lesson for to-day.

MAINS FOR ELECTRICITY SUPPLY.

By F. J. WARDEN-STEVENS.

THE increasing development of electricity supply, involving as it does interference with the streets, makes this subject one of great importance, and it is proposed here to deal both with the cables and with the methods of laying them.

In the first place it may be pointed out that with electric cables it is important that the positive and negative shall be so supported and arranged that they do not touch each other, and so that it is impossible for a leakage to occur. It is necessary if one conductor is in contact with the ground, that the other be specially insulated, but it is more usual to insulate both conductors from each other and also from the earth. The strain on the insulation is often considerable, and is proportional to the electrical pressure; it is therefore necessary to provide extra insulation for high-pressure cables.

A system of mains consists of feeders, distributing cables and services. The first-named are tapped at the end only, and the distributors have service connections at frequent intervals.

Bare Copper on Insulators.—This is one of the oldest used systems of electric mains. A conduit is laid along the street, usually under the pavement, and the top is generally made so that it can be removed and the mains be examined when desired. The usual plan adopted is to fix across a concrete conduit wooden bars to which are attached the insulators, and on these are supported the copper conductors, which are generally in the form of strip. In some cases the insulators are of glass, in others porcelain, and in yet others vitrified stoneware. There are many ways of fixing the copper, but generally copper strip is laid flat in grooves formed out of the insulators, the lengths being usually strained tight by means of weights or other straining devices in boxes placed at intervals. In other cases the copper is made in a tubular form, or a strip is placed on edge so that it will support itself without straining, and in yet other cases the insulators are laid near together so that the strip cannot sag to any great extent. The chief objections to this system are (1) that gas from the surrounding soil can enter the conduit, and in consequence the slightest spark will cause an explosion; (2) it is exceedingly difficult to keep the conduits dry. It is, of course, possible to keep water from accumulating seriously, but damp and films of moisture are apt to creep over the insulators. If the moisture becomes excessive, as often occurs in foggy weather, the positives of the copper strips begin to electrolyse, and the copper hydroxide which is formed covers the surface of the insulators. The result is that owing to the film being a partial conductor, at the next appearance of moisture electrolysis again sets in with greater rapidity, which will go on till the strip is nearly eaten through, when heating will occur, and a spark eventually which may ignite the gas if any be in the conduit; finally the strip will fall and will probably form a short circuit with another conductor of opposite polarity. It may be taken that conduits of this kind are not suitable for laying in roads, consequently insulated cables must be laid for crossings. Copper tubes have been laid in drain pipes in the road, but it is now generally admitted that to be a success a conduit must be used to which access can be obtained all along its length.

The disadvantages of bare copper mains may be summarised as the high first cost, the large space occupied by the conduit, the necessity for a straight run between boxes, the fact that insulated cables must be used when roads are crossed, the troubles caused by electrolysis and the possibility of explosion.

The advantages are, however, the ease with which the copper can be added to, as the demand justifies, without increasing the cost of insulation; the fact that the depreciation is very little, if the culverts are kept dry; and the facility for making service connections to the bare copper; also the saving in capital outlay from this cause making the system suitable for distributing mains.

The disadvantages which are inevitable with bare underground cables are absent if the overhead system can be adopted, as dampness can do no harm, explosions are impossible, and the system is very cheap. The only depreciation which can occur is in the poles, and this can be reduced by adopting iron.

Insulated Cables.—The general practice at the present time is undoubtedly to use cables protected along their whole length by an outside covering which is known as insulation.

The first insulation which was used for electric street mains was gutta-percha; but although this is very good for submarine cables and for all cases where it is either damp or immersed in water and is kept at an even temperature, the conditions cannot be relied upon in street mains, and it is well known that gutta-percha when exposed to the air crumbles and cracks, and finally disintegrates and goes to powder.

The next substance to be used generally was pure rubber. Although pure rubber is itself waterproof, yet when lapped on a cable there is not sufficient adhesion between the laps to insure the insulation being water-tight, and, further, pure rubber is very expensive.

Vulcanised rubber is waterproof, and is now extensively used in cable manufacture. All vulcanising rubber contains from 25 per cent. to 75 per cent. of pure rubber, and the rest is made up of a mixture. The curing of such a rubber is practically keeping it at a certain temperature for a certain time, the temperatures and times varying with the class of rubber. It is necessary to cover the conductors first with pure rubber, as the insulating properties of vulcanised rubber are low, and the vulcanised rubber is put on outside to provide the waterproof qualities, and the whole is then covered with proof tape or braiding and compound. The outer covering is merely a mechanical protection, it is neither insulation nor moisture resisting. The great weakness of vulcanised rubber is that it will not permanently withstand the action of being alternately wet and dry. This is the condition existing in underground mains, and therefore the use of vulcanised rubber is not destined to extend. Already for high-pressure work there are several cases where the rubber cables have had to be removed. The advantages of rubber cables are chiefly the ease with which they may be handled, their flexibility, the facility with which satisfactory joints may be made, and no doubt to some extent their portability, for they are light.

As soon as it was recognised that vulcanised rubber was really unsuitable for electric cables to be laid in the streets, the course was adopted of sheathing it with lead

* *Valor Ecclesiasticus*, 20 Henry VIII.
† *Notes*, by Rev. J. H. Blunt, rector of Breamore, 1867.

which keeps the cable from becoming affected by moisture. There is no doubt that this greatly extends the life of a cable, but still the chemical deterioration of the rubber will go on.

There are several compounds on the market which are claimed to be better than rubber; they are wholly or partially non-hygroscopic, and where lead-covered they are proving successful.

A class of insulation has been in use for some years which is permanent and practically everlasting. The insulation is hygroscopic; that is, it will absorb moisture, and consequently it must be covered with a complete watertight lead sheathing. The insulation itself is composed of jute, cotton or paper soaked in an insulating compound usually of a resinous nature. The compound is not in itself an absorbent of moisture, but however much of it is present in the cable it will not entirely prevent the fibre from taking up moisture to some extent. The materials with which these cables are composed are comparatively cheap, and in consequence a lead-covered fibre cable is much cheaper than an ordinary braided rubber cable. For instance, taking a cable of nineteen strands, each strand being of 16 standard wire gauge, the price of the rubber cable is 135*l.* per mile, while a lead-covered fibre cable is 79*l.* and the lead-covered rubber cable is 155*l.* per mile, *i.e.* double the fibre. The prices are those of a certain firm manufacturing both classes of cable.

There are three classes of fibre cable manufactured—(1) jute or cotton impregnated; (2) jute and cotton for half the insulation and paper for the rest; (3) all paper. The jute impregnated cable has a high insulation resistance, while the paper is not so good an insulator, but has an enormous spark-resisting power. The combination of the two is useful where both high spark-resisting powers and insulation is required, and it is undoubtedly more flexible than the paper cables. These three classes of cables are being extensively used for street mains.

The disadvantages of the lead-covered hygroscopic cables are:—A whole length of the insulation may be ruined by moisture entering at one spot; a minute hole in the lead will often allow sufficient moisture to enter. The cables are difficult to join, as special skill is needed in making a watertight joint with the lead, especially as there is no easy means of detecting minute holes left in the solder. They are heavy, which increases the cost for freightage, and they are not flexible, so drums of large diameter must be used for purposes of carriage. Great care must be exercised at end connections, and unless these are made in watertight boxes and filled in suitably, the taping, if used, may be burst by the pressure of the insulating liquid. The great size of the cable is also a disadvantage where conduits are used, as these have to be large, which increases the expense. Despite these disadvantages, however, the low rate of depreciation and reliability and the moderate cost are securing for them a large demand.

Direct Laid System.—The simplest method of laying cables is direct in the ground. To allow of cables being laid direct it is necessary to armour them with steel strip to prevent mechanical damage, and further to cover the armouring with a preservative compound to prevent corrosion. As a matter of fact, direct laid cables are almost always twin or concentric and not separate. This is necessary with alternating current systems in order to prevent the iron armouring and lead covering from having induced or eddy currents set up in them, and also to keep the wires sufficiently near together to prevent self-induction, which acts as a resistance in reducing the pressure, although there is no direct loss of energy.

The method of laying an armoured cable is very simple. The cable is coiled on a drum which runs on wheels, and can therefore be uncoiled by fixing one end and drawing the drum along the road. A trench is dug either under the footpath or in the road, and the depth of this varies from about 9 inches to 2 feet according to the situation; for instance, the depth must be greater in the road than under a footpath. A layer of sand is then spread over the bottom of the trench to a depth of about 2 inches, the cable is laid on this and a further layer of sand is placed over. If the cable is laid in a place where the ground is likely to be again disturbed, it is well to lay tarred boards or bricks over the sand before filling in the earth. This gives warning to workmen and is also of use in keeping stones, &c., from being forced into the cable by heavy traffic.

The lengths of cable are jointed together, as a rule, in cast-iron watertight boxes, which are usually filled with compound This prevents moisture from entering the cable even if it gets through the box.

Built-in Systems.—There are several built-in systems, the chief one being the bitumen. A trough usually made of iron or of wood is laid in the trench, and the cables which are not armoured are laid on wood distance-pieces. The whole space is then filled up with bitumen, and a cover is laid on so that the cables are well protected from mechanical or chemical injury, and are accessible to a certain extent. In this system the cables need not be as highly insulated as with others, part of the insulation being the bitumen. Lead-covered cables (unarmoured) laid in this way are claimed to be practically everlasting, and this method of laying is being extensively adopted.

Drawn-in Systems.—There are a number of these systems, and it is unnecessary to give a complete list of the different conduits used. The principle is that the cables are drawn into conduits which are laid previously, and there are boxes placed at intervals from which drawing-in and jointing operations can be carried on. Conduits are made of cast and wrought-iron, earthenware, bitumen and other substances. The chief difficulty experienced with them is the jointing together of the lengths in a flexible and watertight manner, as the ground is always liable to sink a little with the result that the joints, if rigid, will crack and let in water. An important point is that cables drawn into conduits are subjected to a wet and dry action, for although water may not enter, with most materials the inside surface of the conduit will "sweat." Further, it is almost impossible to insure that water shall not enter. It is well, therefore, to use lead-covered cables with conduit systems, or an insulating material which is unaffected by the "wet and dry" action.

Iron pipes are laid exactly as they would be for gas or water, *i.e.* usually with a lead cast joint. In most cases with iron pipes large ones are used in preference to several small ones, owing to the relatively high prices of the latter. For this reason the usual course is to draw more than one cable into a pipe. This method has often been condemned, as a failure of one cable is apt to affect the others. Drain pipes have been used, laid in the ordinary way, and with lead-covered cables; they have been successful and are inexpensive. A flexible joint on the ball and socket principle has been introduced, and should come largely into use. All that is required in laying these earthenware pipes with the ball and socket joint is to push one into the other and fill in. It is immaterial whether they are laid straight or not, or whether the ground sinks afterwards. It is claimed that under all reasonable and even possible conditions the joint will remain good.

Stoneware casings are largely used for conduits. They are generally of oblong section, and contain several square "ways" for the cables, a separate cable being drawn into each way. The joints are made with cement or bitumen, the jointing material being poured in between earthenware or iron saddle pieces placed round the ends of the two adjoining casings. Stops are placed in the conduit during the jointing process to insure that the cement or bitumen, as the case may be, shall not run into the inside, and by this means the ways are kept smooth. Great care must be exercised with this conduit to insure its being firmly bedded, otherwise joints are liable to crack.

It is considered to be unsuitable for laying in roads, so the footpath is generally utilised, a box being placed at each side of any road to be crossed and iron pipes laid between them.

In one system bitumen blocks having holes or ways moulded in them are laid in a similar way to the other casings, the joints being poured with hot bitumen. A great objection to this system is that cables are apt to sink into the bitumen when left for any length of time, in which case they cannot be removed.

Another system in which bitumen is used is very similar to the bitumen solid system. Instead of laying the cables in the trough, paper tubes impregnated with bitumen are

laid on separators and the whole is filled with bitumen as before. The result is a series of ways in a bitumen conduit through which the cables may be drawn without fear of their sticking.

It may be of interest to give a comparison of the cost of various conduits, the standard being for a three-way conduit, each way being 2 inches across. Three separate pipes have been taken for the iron, as one large pipe is unsuitable for comparison.

Material.	Cost of the Material. s. d.	Cost of Jointing, &c. s. d.	Total. s. d.
Stoneware casing . . from	1 10	0 2	2 0
to	2 3	0 6	2 9
Bitumen blocks with ways .	2 9	0 6	3 3
Three cast-iron pipes . .	3 6	1 0	4 6
Three wrought-iron pipes .	4 1½	1 0	5 1½
Bitumen with embedded paper tubes	—	—	10 0

The cost of excavation and reinstating is not included, and no boxes are allowed for. The total cost in the cable is that per yard for a length of not less than one mile, the conduits being laid in a prepared trench and left ready, when boxes are added, for the drawing-in of the cables.

(To be continued.)

DURHAM CATHEDRAL.

THE cathedral of Durham, which occupies a lordly position that suggests it was a representative of the Church militant in more than one sense, is interesting not only from its architectural character, but from the fact that it was apparently the first building of magnitude in which there was a departure from the type which was introduced by the Norman ecclesiastics and which signified Norman dominion. The change was seen in the arrangement by which nave and choir approximated in area and in the substitution of a vaulted roof of stone for one of timber. The cathedral was therefore an assertion of native skill remarkable enough for the courage required in the designers, and it inspired many other experiments until finally English Gothic became an independent style with characteristics which were not to be found in France, Germany or elsewhere.

The site could easily be imagined as selected by a military strategist, and indeed the Norman bishops who erected a part of the existing building could not expect to reign if they depended on spiritual arms alone. The whole region was known to be occupied by a stubborn race who could only be controlled by force. Indeed, the first of the Norman bishops was slain at Gateshead, and although it is supposed his own men were the murderers, yet that circumstance only proves more strongly the danger of episcopal rule in the place, for there could be no confidence in either Normans or Britons. The site, however, was not selected with a view to defence in case of insurrection, it was determined by circumstances in which neither artists nor soldiers had a part. To explain them will need a glance through the mists of an age which no historian has succeeded in dispelling.

It is generally admitted that the Roman missionaries were not as successful in the north of England as in the south. The inhabitants were partly derived from Danes, Norwegians and other rovers, who in their own lands were opposed to Christian doctrines out of loyalty to their pagan ancestors. It was not to be expected that their descendants would be more tractable. PAULINUS made his way to the Northumbrian court, and of him WORDSWORTH gives a vivid picture :—

> Who comes with functions apostolical?
> Mark him, of shoulders curved and stature tall,
> Black hair and vivid eye and meagre cheek,
> His prominent feature like an eagle's beak:
> A man whose aspect doth at once appal
> And strike with reverence.

EDWIN, who reigned in Northumbria, called a synod of his councillors, a primitive Parliament, to consider the difference between Paganism and Christianity, and it was then one old chief compared man's life to the passage of a bird across a hall, coming from a place which nobody knew and going again into a mysterious obscurity. PAULINUS was heard, and as a consequence the figures of WODIN and THOR were overturned. The Roman missionary was granted a house in York, and became bishop of the district. EDWIN was afterwards slain at Hatfield Chase, and his death retarded the progress of Christianity. The sceptre passed into another branch of his family, and paganism was restored. Eventually it was grasped by OSWALD, who was a Christian. He had found a refuge in Scotland, and there it is supposed he was baptized. It was as a Christian he returned to England to fight against CEADWALLA, who had seized the country, and his success was attributed by him to the aid of Heaven. Out of gratitude he resolved to promote Christianity, and he sought teachers not from York but from Scoto-Irish monasteries. One of the men sent was AIDAN, who received from OSWALD the island or semi-island of Lindisfarne as a monastic property. OSWALD, however, could not escape the fate of a Northern prince. He was slain in a battle by his pagan opponents. Amidst the troubles which followed Lindisfarne or Holy Isle was not without a supply of monks from Iona. FINAN, who succeeded AIDAN, built a timber church, which was covered with reeds. Then came COLMAN, TUDA and EATA. The last brought with him from Iona a youth named CUTHBERT, who was afterwards a monk at Melrose. In turn CUTHBERT became prior at Lindisfarne, but he desired a more penitential life, and sought a hermitage in one of the little Ferne Isles off Bamborough Head. Subsequently he was elected Bishop of Hexham, but was allowed to exchange it for the bishop's office at Lindisfarne. The old longing for solitude, however, prevailed over him. He again retreated to his rocky isle, and there he died, as is supposed in 687. His remains were brought to Lindisfarne.

For about three centuries the body of the saint was a treasure which could be guarded with difficulty. Until the middle of the ninth century the great diocese was ruled from Lindisfarne. The island was supposed to be more secure against Danish invaders than the mainland. Provision had to be made for the training of ecclesiastics, and in those days a monastery was considered to be the best of seminaries. But at last the bishop was compelled to leave the island with his community. They appear to have spent several years in wandering: apparently it was not easy to find a place where the episcopal chair could be set up in peace. The saint's body was carried with the wanderers. Chester-le-Street was at last selected, and a cathedral was erected on a site given by GUTHRED, the Dane. But an invasion compelled the clerics to leave that shelter. Then when peace was established they wished to return, but, according to one account, on reaching a place called Wardlaw the saint's coffin became immovable, and a member of the party announced that he was informed in a revelation it would remain in that condition unless they decided to seek a resting-place at Dunholme, which is now known as Durham. Sir WALTER SCOTT has given the following rhymed version of the legend :—

> Nor did Saint Cuthbert's daughters fail
> To vie with these in holy tale;
> His body's resting-place, of old,
> How oft their patron chang'd, they told;
> How, when the rude Dane burned their pile,
> The monks fled forth from Holy Isle;
> O'er northern mountain, marsh, and moor,
> From sea to sea, from shore to shore,
> Seven years Saint Cuthbert's corpse they bore.
> They rested them in fair Melrose;
> But though, alive, he loved it well,
> Not there his relics might repose;
> For, wondrous tale to tell!
> In his stone-coffin forth he rides,
> A ponderous bark for river tides,
> Yet light as gossamer it glides,
> Downward to Tilmouth cell.
> Nor long was his abiding there,
> For southward did the saint repair;
> Chester-le-Street and Rippon saw
> His holy corpse, ere Wardilaw
> Hailed him with joy and fear;
> And after many wanderings past,
> He chose his lordly seat at last,
> Where his cathedral, huge and vast,
> Looks down upon the Wear:

There, deep in Durham's Gothic shade,
His relics are in secret laid;
But none may know the place,
Save of his holiest servants three,
Deep sworn to solemn secrecy
Who share that wondrous grace.

The concluding lines are no longer exact, for in 1827 the floor of the shrine in Durham Cathedral was opened and remains were found enclosed in three coffins, which were respectively of the years 1541, 1041 and 698. The skeleton was swathed in embroidered robes, and various insignia were with it. Parts of the inner coffin were preserved and are in the cathedral library. From the character of the carved figures of saints upon it there is no doubt the coffin is over a thousand years old.

The account of the connection of St. CUTHBERT with Durham is not irrelevant. A cathedral or great abbey was incomplete without relics that were recognised as important. We have already narrated some of the circumstances which made St. Albans Abbey dangerous, because even the Danes were eager to steal the body of the British protomartyr. In Canterbury the relics of St. THOMAS were rigorously guarded. When we find the Venetians organising an expedition to carry off what survived of St. MARK, the conclusion is irresistible that saint stealing was not deemed a heinous crime, except by the religious who were plundered. The monastery that contained St. CUTHBERT's relics became, therefore, the chief religious house of the diocese, and its church was the cathedral. What kind of building was erected by ALDHUN at the end of the tenth century is unknown, but the stones were likely to be used by the Normans.

The advantages of the site could not fail to be recognised by the invaders, and the security it offered is shown by the erection close by of the castle. There was no part of England in which danger to the Norman was more imminent. As a consequence, no less than twenty-seven years elapsed after the Battle of Hastings before WILLIAM CARILEF, the bishop, was in a position to commence a new cathedral. His Norman predecessor, Bishop WALCHER, realised that the see was equal to a principality, and accordingly purchased an earldom; but the people did not understand the open combination of secular and spiritual power, and he was slain as a tyrant. CARILEF was also to have experience of the vicissitudes of fortune. Before he commenced building he wished to reform the organisation of the cathedral. Attached to it were secular priests, some of whom were married, and he resolved to dispossess them and substitute Benedictine monks. It is right to say the new-comers were not all foreigners. But the bishop somehow fell into disfavour and was exiled. It was not until after his return he undertook the erection of a cathedral.

CARILEF began with the best intentions. As death removed him after two or three years, he was not able to erect much more than the choir. ALDHUN'S church no doubt served as a nave. Whether he commenced the stone vaulting is uncertain. There were no precedents in England to be followed, and the question is, could enough skilful masons be found in England to deal with the difficulties? Bishop FLAMBARD, who followed, continued CARILEF'S work. By the year 1104 the church was so far complete that the body of St. CUTHBERT, which had been placed in a temporary building in the cloisters, was removed to the choir. In connection with the removal a new legend arose. It was apprehended that some timber which was in the choir might succumb and cause damage to the shrine. They were unable to remove the timber, which may have consisted of centreing and supporting props, but during one night the whole of the timber was said to have been taken down and piled in order on the floor, and the conclusion drawn was that St. CUTHBERT had undertaken the work. FLAMBARD raised the walls to the springing of the vaulting, and then died. The bishopric was vacant between 1128 and 1133, but the monks went on with his work in the nave and transepts.

GALFRID RUFUS is credited with the construction of the chapter-house, but of late years it is considered that there was more than one style exhibited in it, and there can be no certainty on the subject. The building was annihilated during WYATT'S operations. CARTER, who saw it in 1795, speaks of it as "one of the proud examples of the Saxon species of architecture, and which alone would have established the skill of our ancestors were this room the only proof of their high abilities." He was mistaken in calling the work Saxon, but his words suggest the impressiveness of the structure.

HUGH DE PUISET or PUDSEY presided over the see from 1153 until 1195. His tenure is memorable, for in it originated the Galilee, which is likely to be always a subject of contest among archæologists. It is recorded that he kept two architects named ROGER and WILLIAM in his employment. Their artistic skill was superior to their constructive powers. They erected the Galilee, which is marvellous in its lightness and grace, especially if compared with the work around it; but if care had not been taken at a subsequent time to construct buttresses to withstand the thrust of the arches the Galilee would have collapsed. There were some operations at the east end of the cathedral in PUDSEY'S time which were likewise unsuccessful. The tradition is that he intended to add a lady chapel to CARILEF'S choir, and began the work. The operations did not advance in a way that satisfied him, and he concluded that the addition was not acceptable to Heaven. St. CUTHBERT, who in life was a woman hater, was supposed to be inimical to the existence near his shrine of a place where they could congregate. The work was accordingly abandoned in that place. But the bishop carried out his resolve by erecting a chapel at the west end of the cathedral which was called the Galilee. Whether it was intended to serve as an ordinary lady chapel, a chapel for short services, a place for penitents and pagans or other purposes must be left to conjecture. CARTER described it as "an architectural labyrinth," and the phrase is sufficiently expressive of the appearance of the Galilee with its clustered columns and zigzagged arches. Apart from its beauty it is valuable as evidence of the aspirations towards delicacy in the twelfth century.

RICHARD POORE, who had gained credit by his work at Salisbury, was PUDSEY'S successor. He was able to make the east end secure, and he intended to erect the chapel of the Nine Altars behind the choir. But that work was commenced by his successor, NICHOLAS FERNHAM, in 1242, and is supposed to have occupied forty years. In style it is Early English of a most refined type.

The great central tower is not equal in effect to the Canterbury example, but it is an admirable work, and is well adapted by its general appearance to be the crowning feature of the cathedral. Although erected so late as the fifteenth century, and having the characteristics of the Gothic of that time, the general mass suggests that attention was given by the designer to the form of its predecessor or predecessors. The smaller towers are more in keeping with the character of the cathedral, a building in which there is combined the spirit of Iona and of Rome, of Normandy and of England.

THE INSTITUTION OF CIVIL ENGINEERS.

THE majority of our metropolitan scientific societies have followed the example of the old society by establishing clubs financially independent of the institutions they represent. One exceptional case is that of the Institution of Civil Engineers, which, instead of having given birth to a club, may be said to have sprung from one. This is the Smeatonian Club. This association, established by the celebrated Smeaton, met originally to discuss engineering matters over a Welsh rabbit and porter, the members being limited to this humble pabulum; but as engineering prospered and engineers became rich the fare increased in abundance and excellence; and a Smeatonian Club dinner ranks with the best of London club feasts, the Smeatonians being, we presume, desirous of impressing on their guests how engineering has flourished since the days of Smeaton and the Welsh rabbits. But while the members of this club are fully aware of the importance of progress, they have very properly retained some of the original features of their association. Thus the card of invitation to a club dinner is headed by these words, "To order all things in measure and number and weight," taken from the apocryphal book of Wisdom; and the following quaint sentiment, attributed to Smeaton, is drunk with due ceremony at every club dinner:—"Dam the canals—sink the coal-pits—blast the minerals—consume the manufactures—disperse the commerce of Great Britain and Ireland."

M. FRÉMIET'S ST. GEORGE.

AMONG the Seven Champions of Christendom the preference is usually given by children to the English St. GEORGE, and artists have followed them. The fine figure by DONATELLO in Florence is considered to be almost the ideal Christian warrior. The Mediæval sculptor who created the statue of St. GEORGE in Westminster has reached a higher standard than the Italian. In England we have become familiar with the saint through PISTRUCCI's representation on the coinage, for which a Greek type was adopted both for the man and the steed.

M. EMMANUEL FRÉMIET, in the group we illustrate, comes nearer to the Westminster than to the neo-Grec warrior. The Mediæval figure represents a man who is not a youth like DONATELLO's figure, and we may conclude he was not inspired by rashness but by a conviction of duty when he undertook the task of slaying the dragon. M. FRÉMIET prefers action to repose in his statues, and in this group he has been able to contrast the struggle of the horse to escape from the touch of the monster with the dying struggle of the dragon. For the latter figure our sculptor has studied extinct as well as living creatures.

NOTES AND COMMENTS.

WHEN Sir GEORGE BIRDWOOD has to renounce official duties in the India Office—he is now a supernumerary until after the Paris Exhibition—it is to be hoped he will have more opportunities to enrich the world by writings on Indian subjects. Especially is it desirable that he should continue his protests against the degradation of art by official efforts to impose on the world prisoners' work that is lower in quality than any product of a machine, as if it were produced by genuine handicraftsmen. His belief is that "every house in India is a nursery of the beautiful," and he has endeavoured to repel the system which would make ugliness cross every threshold. If the arts of India are known and appreciated beyond the boundaries of the empire, it is in a large measure owing to Sir GEORGE BIRDWOOD'S efforts. His encyclopædic knowledge would find in Indian arts enough to expatiate on if he were to live to the age of the patriarchs. Occasionally he has found western topics worth notice, for his scrutiny of flowers, trees and fruit in Academy pictures made many a painter ashamed, and helped to secure accurate representations of vegetation.

PROFESSOR ADOLF MENZEL, who is one of the five honorary foreign members of our Royal Academy, has well earned the distinction of the Order of the Black Eagle, bestowed on him by the Emperor of GERMANY. He has mainly devoted his powers to the illustration of the life of FREDERICK THE GREAT, and his oil-paintings and drawings are far above the usual level of court painters. If the Emperor gave the decoration which brings with it the right to be a "Von" simply as a token of esteem or of gratitude for services rendered, it would be a gracious act. But when it is announced that the Order is intended to serve as a stimulus to other artists, in order to induce them to perform similar work, the affair assumes a different character. German subjects are generally adapted for the pleasure of German amateurs, although much is produced which has that touch of nature which makes all the world kin. But to see a host of pictures with FREDERICK for the principal figure is not cheering to foreigners who have admired German art.

THE "lift" is supposed to be an invention that arose from the necessity of reaching the upper storeys of buildings without any loss of time, and therefore is manifestly modern. If considered in connection with motive power and the mechanism by which journeys are made easy, there can be no doubt that the perfected lift is a creation of the nineteenth century. But the appliance could not escape the law of evolution. It has been discovered that a "chaise volante" was constructed in the Palace of Schœnbrünn, near Vienna, for the use of the Empress MARIA THERESA about the middle of the eighteenth century. It was a small square room hung with red silk, and was suspended by strong ropes with counterweights. It was moved up and down a shaft with ease. The heroic empress was periodically in delicate condition, and was unable to ascend stairs without enduring pain. NAPOLEON when at Schœnbrünn used the "chaise volante," and was apparently amused by its simplicity. Another lift consisting only of a chair on a platform was constructed about the same time for the DUC DE LORRAINE.

FOR a great many visitors to Copenhagen the most interesting building in the city is the Thorwaldsen Museum. The great sculptor was born in Copenhagen in 1770, but his father was a poor ship carpenter from Iceland. In the museum are several of his works in marble, and there are plaster casts of the remainder. The sculptor's grave is in the central court. The halls and compartments are decorated in colour in order to make the sculpture stand out with more effect. On the exterior of the building, which is almost Egyptian in its severity, is a fresco frieze representing the triumphal reception of THORWALDSEN when he returned from his long residence in Rome. As it was painted soon after the sculptor's death (which occurred suddenly in 1844), the frieze is manifesting the difference of the atmosphere in Italy and Denmark. Hitherto the authorities were afraid to meddle with it; but OSCAR MATHIESEN, the painter, has perfected a method which gives hopes of success, and an attempt will shortly be made to restore the fresco. The authorities have another anxiety. The museum contains a large collection of private papers which belonged to THORWALDSEN. They have been kept concealed. But the interest which is now taken in the lives of artists has inspired many efforts to investigate the documents, and unveil the mysteries of the sculptor's life in Rome. Much indignation is expressed against the apparent resolve of the directors of the museum to keep all the papers entombed.

IN spite of all their faults the Municipal Council of Paris have displayed a willingness to aid the arts of painting and sculpture. Every year a liberal sum is expended on the purchase of works from the exhibitions in Paris. It is not so easy to aid the arts of engraving, etching and lithography, for a difference is made between the purchasing and commissioning of works. Where there is an earnest desire obstacles are usually surmounted. The Council have therefore resolved to expend 40,000 francs on the reproduction of eight pictures in the Hôtel de Ville by means of etching or lithography. The artists whose works will be made the subjects of the plates are MM. JEAN PAUL LAURENS, H. GERVEX, G. CLAIRIN, and GEORGES PICARD. A picture by FRANK HALS will also be reproduced. The French works form part of the decoration of the Hôtel de Ville, and are therefore worthy of an engraver's translation into black and white. The plates will help to increase the interest in the Hôtel de Ville, which, regardless of prejudices, is becoming the centre of Paris life. It would be well if many other municipalities outside France would imitate the Parisian example.

THE executors of the late PUVIS DE CHAVANNES are able to offer 163 drawings by him to the city of Paris. It is stipulated that they are to be hung in the new museum of the city at a height corresponding with that of an average man. The artist, like the majority of his brethren, had always a repugnance to "skying," and naturally he desired that his bequest should be in a position where all the drawings could be closely scrutinised. The museum will hereafter be installed in the small palace of the arts which is in course of erection in the Champs-Elysées under the direction of M. CHARLES GIRAULT. But it will not be available until the International Exhibition of 1900 is closed. Meanwhile the drawings will be framed and exhibited in the Musée Galliera.

ON the passing of the Church Act (Ireland), 137 of the Ancient Monuments of Ireland were vested in the Irish Board of Works. Under the Ancient Monuments Acts of 1882 and 1892, some forty eight more became vested in the Board. Many matters of difficulty in connection with the preservation of these Monuments were constantly arising, some of them entailed subjects about which there was a great deal of controversy, and there was a very general notion abroad that it was desirable that some of the Irish antiquaries should be consulted before repairs or restorations were undertaken by the Commissioners of the Board of Works to Irish Monuments. In 1892 the chairman of the Board of Works proposed to the Royal Society of Antiquaries of Ireland and to the Royal Irish Academy that each body should appoint two representatives who, with a Commissioner of the Board of Works, should be a committee to meet monthly and consult with the superintendent of Ancient Monuments before any more monuments were scheduled or repairs or restoration effected on those at present scheduled. The suggestion was adopted, and it has been found that the committee fulfils a very useful part. A list of the Monuments scheduled under the advice of this committee is in preparation.

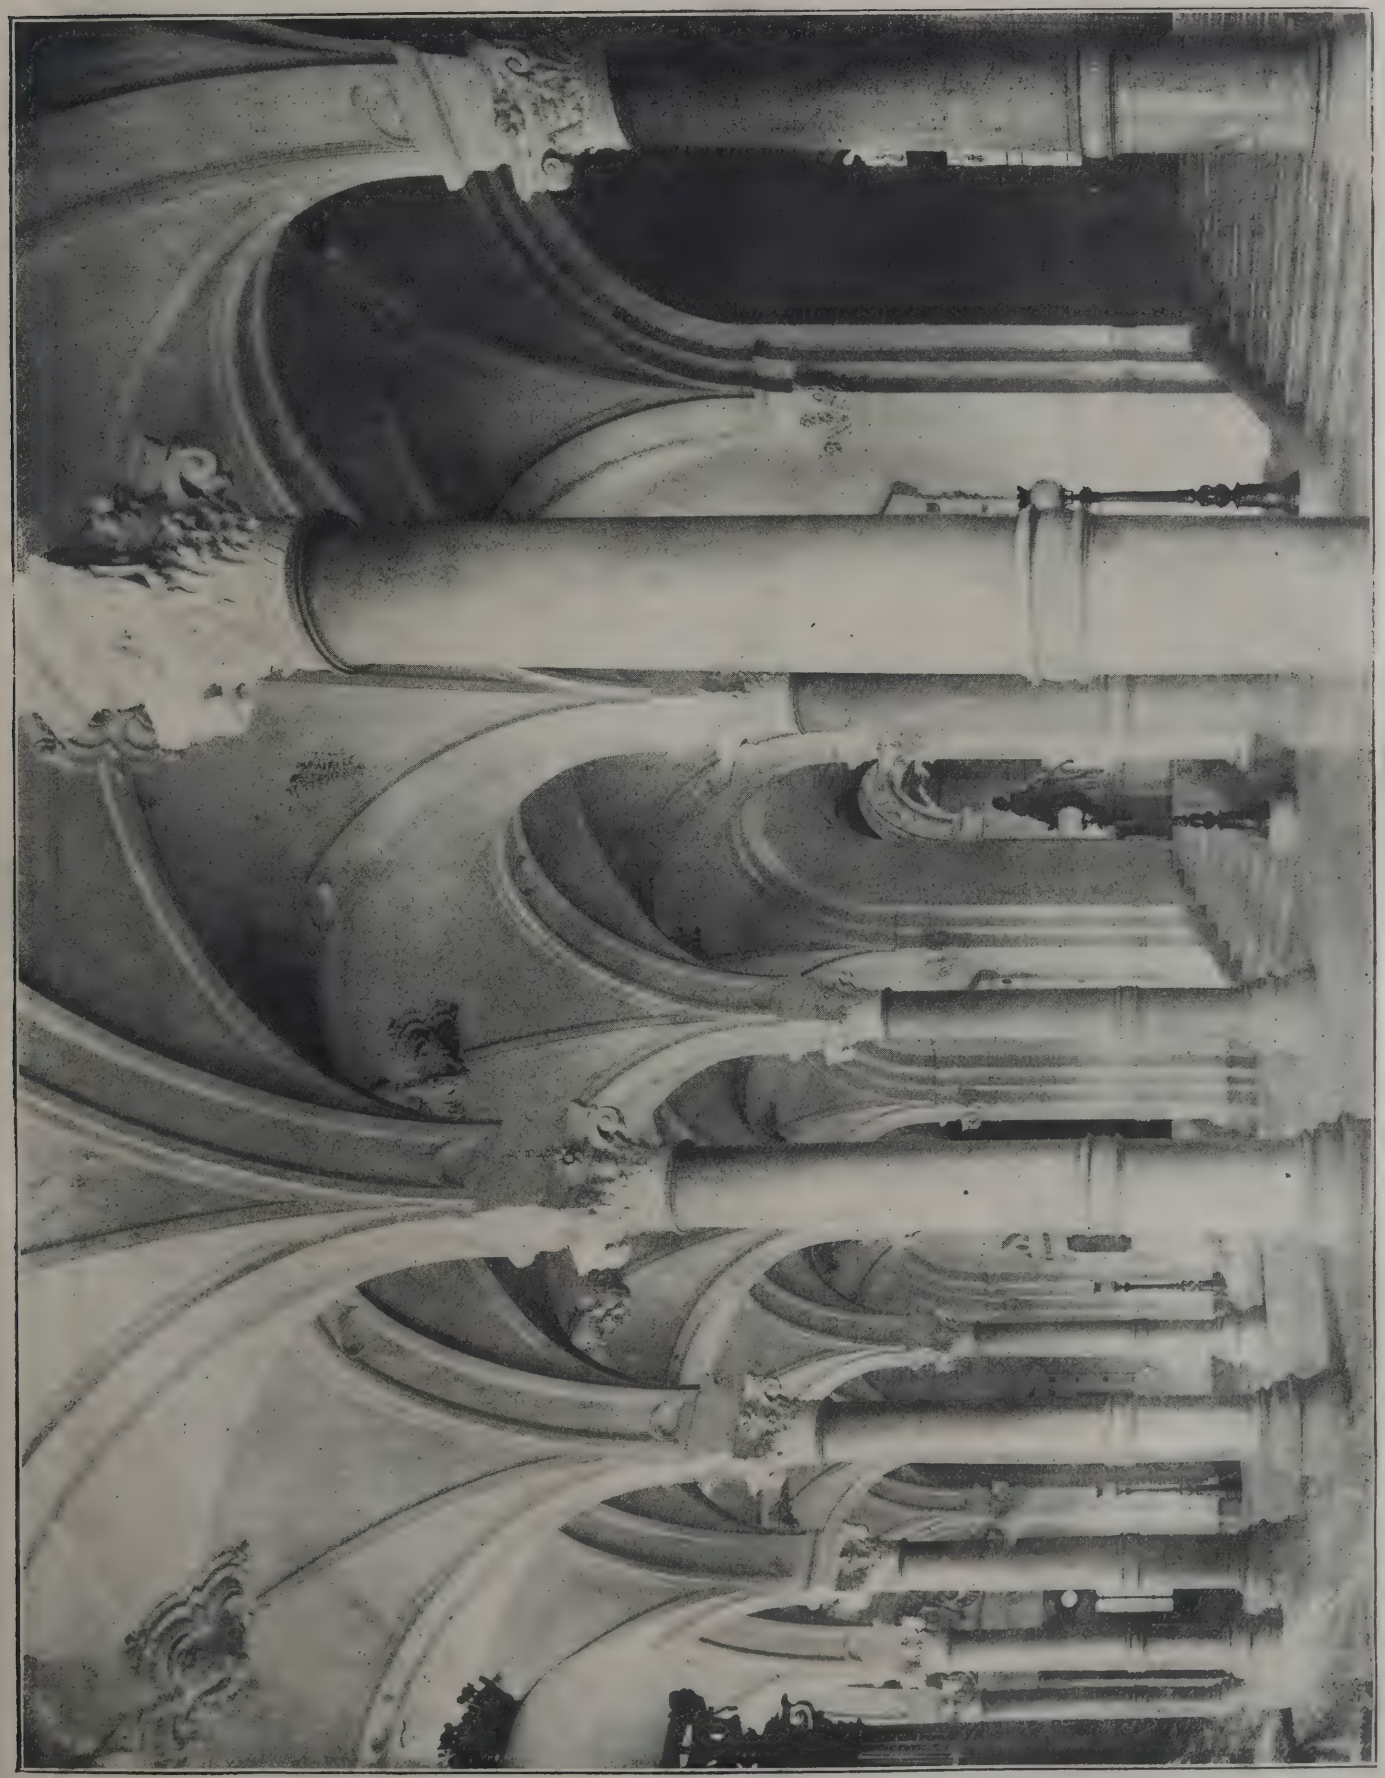
HÔTEL DE VILLE, PARIS.

WE have already published reproductions of some of the geometrical drawings of the Paris Municipal Buildings, but the architectural effect can be judged more easily from photographic illustrations. The three views will suggest the treatment which has been followed in some parts of the interior. The architects, who were the late THÉODORE BALLU and M. DEPERTHES, were to some extent bound by the character of the old Hôtel de Ville, which was designed by DOMINIQUE BOCCARDO in the sixteenth century, and greatly altered in 1837 by MM. GODDE and LESUEUR. It is worth mentioning that the central portion of the existing Hôtel de Ville closely corresponds with a similar part of BOCCARDO's building.

STAIRCASE, HÔTEL DE VILLE, PARIS.

The former plan is also followed to some extent, for the central part contains the council chamber and salles for grand receptions, towards the quai are the salons for ordinary receptions, and the administrative offices adjoin the Rue de Rivoli. In the foundations of he building stones were used which survived he flames to which the greater part of the old Hôtel de Ville succumbed. As the Seine runs along one side of the building, care had to be exercised to keep the lower parts watertight. A stratum of hydraulic béton faced with cement was laid down, and for the masonry stone from Villebois and St. Ybe was selected.



Prior to the fourteenth century the council used to meet in a house near the Grand Châtelet. In 1357 a house which belonged to the Dauphin was, on the sugges-

Hall in Hôtel de Ville, Paris.

tion of ETIENNE MARCEL, purchased as the rendezvous of the members. Additions were made to it, for at the time the Hôtel de Ville had to comprise a chapel, a court of justice and an arsenal as well as council chambers and offices.

In those halls and the staircase which are represented, it will be observed that the architects availed themselves of the liberty which was always considered to be allowable with French Renaissance. The Tuscan, Ionic and Corinthian columns are not those of Rome. The desire was to have a marked contrast of curved and right lines, and to gain that effect much of what used to be called purity is sacrificed. All visitors will, however, acknowledge that the chilling influence which so often is exercised by Classic details is absent from the Hôtel de Ville.

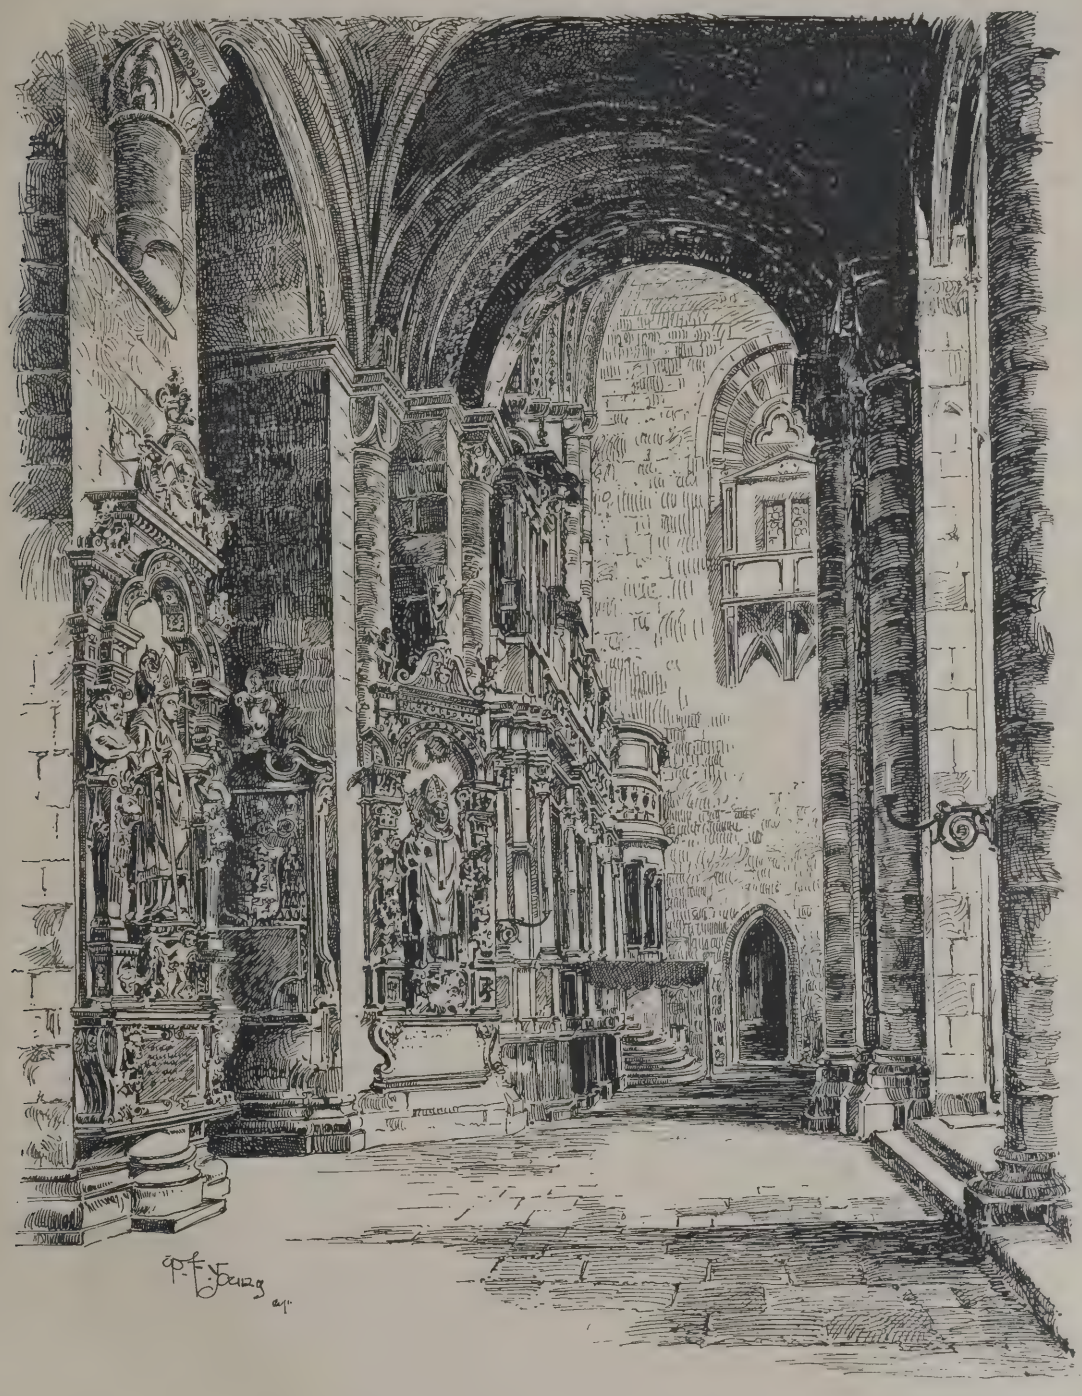
HALL IN HÔTEL DE VILLE, PARIS.

JOTTINGS AMONG SOME CHURCHES OF THE LOWER RHINE.

WE have had "a calm sea and a prosperous voyage;" we have witnessed that most impressive spectacle, a sunrise at sea; and at five o'clock are undergoing the ordeal by search in the custom house at the Hook of Holland. The bustle and official asperity attendant upon the ceremony is to our fancy softened down by the awful stillness pervading everything at this early hour, and we presently emerge with light hearts and all the continent of Europe where to choose, to find places in the corridor express for Cologne. A few moments elapse and we are being luxuriously wafted across the placid Dutch landscape. Pleasant it is to be told, after a brief interval, that this *mélange* of red-brick houses, gables, ships, and canals dominated by a stately, but coarse, cruciform church is Rotterdam. Now we stop for a few moments at a collection of sheds so insignificant that we can hardly suppose them to represent the station of a city of such dignity and importance; then we glide onwards, and as the church towers, houses, ships and canals recede further and further from the gaze, a look of blank dismay crosses the face of each of the party, only to be followed by a hearty laugh at our own obtuseness. We have missed Rotterdam. Never mind—we will console ourselves at Dordrecht, whose stately red-brick tower comes into view sooner than we have recovered our equanimity. Determined not to be done this time, impedimenta are hastily collected, and the moment the train slackens speed we prepare to alight, and are soon established on the platform to discover that we are the only débarqueurs.

Telegrams despatched to anxious relatives at home, and baggage left at the station, we wander, with minds and bodies alike unencumbered, into Dordrecht, to find its typical Dutch streets, even at this early hour of the morning, swarming with life and bustle—the bourgeoises arrayed in their smartest coiffures, the cafés rapidly filling with market folks, and the whole place presenting a scene of great animation in the brilliant sunshine of an August day. Breakfast having appeared, and in due course disappeared—by the way, the removal of some artificial plants from the table is imperative before ample justice can be done to the meal, so unpleasant an odour do they diffuse—we start out with no particular object in view beyond that of thorough relaxation, bodily and mental.

Presently we arrive at the great church of St. Mary, whose stately western tower entirely of brick is admirably represented in the drawing which "embellishes" this article, as the old *Gentleman's Magazine* would say. Although it has a certain air of rugged grandeur about it, this great church at Dordrecht cannot be regarded as worthy of study or admiration. Built, as the majority of the Dutch churches are, of brick, it presents many features in common with those of Belgium. The western tower, the short nave, the deeply projecting transept, the long choir with its processional aisle and corona of chapels, the cylindrical column and the general air of flimsy coarseness pervading its decorative features—all are here. Imposing as these churches of the Netherlands are from their spaciousness, we desiderate in them not only that artistic design, but that beauty of well considered and appropriate detail so satisfying to the mind in those of France. The deep choir of this church at Dordrecht, with its noble arcade of Mechlin-like piers and arches, is destitute of furniture save a double row of Early Renaissance stalls and subsellæ. The Dutch Calvinist's sacraments being preaching and hymn-singing, he provides his nave with a pulpit upon which he lavishes his thousands, and an organ-loft still more sumptuous. Singularly enough this long empty choir at Dordrecht is separated from the transepts by one of those rood-screens which forms often the only item of interest in a Dutch ecclesiastical interior. In Holland the choir has generally been kept up, with the exception of the destruction of the altar, as it was. Frequently very much elevated above the aisles and presbytery, furnished with stalls and subsellæ, and defended by a noble rood-screen, it presents an imposing appearance, especially if it should so happen that a canopied high tomb takes the place of, and may to the fancy at a distance represent, the altar. Such a passion have the Dutch for the screen that in cases where the rood-loft has been destroyed they will, as here at Dordrecht, erect a modern one at great expense, and in cases where the choir lies absolutely open without parcloses this western screen will be kept locked.*



DORDRECHT.

* The following churches in Holland contain the finest examples of this instrumentum ecclesiasticum:—St. Bavon, Haarlem; SS. Mary and Catherine, Amsterdam; St. Laurence, Alkmaar; St. Peter, Leyden; and St. Adalbert, Egmont. The erection during the last century of this screen at Dordrecht reminds one of a person raising a triumphal arch before the entrance to his coal cellar. "Thank God," was the mental ejaculation of one of the party, "one is not doomed to 'worship' here every Sunday." To an English Churchman with the well-ordered cathedrals and parish churches of his own country a Dutch church is a sorry spectacle.

Pleasantly the remainder of the day passes at Dordrecht, particularly the afternoon, when we sally down to the port, which reminds of St. Ogg's in "The Mill on the Floss," and where we sit alternately sipping coffee and looking at the traffic on the Waal until it is more than fully time to think of repairing to the station for the resumption of our journey. This is performed in the cool of the evening, and beautiful is the effect of the landscape, with every now and then a tall red-brick tower rising up from the plain against an opal-tinted sky as the train bears us on to Nimwegen, which with its numerous steeples wears an air of great importance and interest viewed for the first time from the opposite side of the Waal. The ancient ecclesiology of Nimwegen is not particularly interesting, the great parish church, built in the form of a Greek cross with a western steeple, being a horribly whitewashed preaching-house, with all the windows gutted of tracery. The pulpit and organ-loft are of course sumptuous, and the presence of a number of brass chandeliers imparts some relief to the surrounding wretchedness. The western steeple, a nobly-proportioned erection in brick, groups well with that of the modern Roman Catholic church* built during the sixties in an Early Pointed French style from the designs of M. Cuypers, and consisting of a short nave with a grand "tribune" above the arcades, a central lantern, transepts, and gracefully-groined apsidal sanctuary.

The colouring—vitreous and mural of this church, as well as that of a partially old one built on the model of one of the German hall churches, with very tall arcades—was, if not of the highest order, solemn and devotional, so that one could not forbear exclaiming on entering, in the words of the introit, "Quam terribilis est locus iste; hic domus Dei est, et porta cœli; et vocabitur aula Dei." From Nimwegen we go to Cleves, where the great red-brick Stifts-Kirche, with its twin western spires and its clerestoried nave and choir under one long line of roof, with a tiny flèche only to

MAYENCE CATHEDRAL: VIEW IN NAVE AISLE LOOKING TOWARDS WESTERN TRANSEPT.

* One of a series as striking as that built by Mr. J. Brooks in the north-eastern districts of London about the same period. Among these churches of M. Cuypers may be mentioned St. Barbara, at Breda; St. Catherine, Eindhoven; St. Peter, Sittard; and others in Amsterdam, Alkmaar, Eilendorf and Vechel.

mark the separation, recalls the Marien Kirche at Lübeck. Tautological as this type of church may appear, it is admirably adapted for immense congregations, as is patent on the Sunday of our visit, when every inch of its spacious floor is crowded at the Sing Amt or People's Mass, numbers overflowing into the porches, and content to listen to the service and join in the hymn-singing from outside.

The afternoon of this intensely hot Sunday is spent at Xanten, easily reached from Cleves *viâ* Goch, little of remark being passed upon the journey beyond several laughable specimens of modern ecclesiology. As we saunter up the long shady road leading from the station to the town, the tones of a deep bell from one of the steeples of St. Victor's collegiate church announcing the postprandial Offices smite upon the ear.

TRÈVES: THE CATHEDRAL AND CHURCH OF OUR LADY, FROM THE N.W.

We enter the little town, emerge upon the broad market-place, turn to the left and pass beneath a sumptuous southern portal into the most picturesque ecclesiastical interior of North Germany, whose effect is considerably enhanced by the kneeling congregation in the open benches ranged in nave and aisles, and by the tones of the organ, which, placed Strasburg-wise in the triforium, is accompanying the voices in a solemn Litany. This collegiate church of St. Victor at Xanten is a five-aisled structure of the best Decorated period, the western steeples alone remaining of the old Romanesque building. There are no transepts; the choir ends in an aisleless five-sided apse with two tiers of windows, each of the side aisles being quasi-hexagonally terminated. Very beautiful are the slender clustered shafts dividing the double aisles, adown which tryptich-surmounted altars are ranged. There is some glorious old painted glass, chiefly in the windows of the north aisle, and a screen with doors placed eccentrically, with an altar between them according to German usage, separates the nave from the choir, which, with its stalls and subsellæ, its tapestry, standard lights, parcloses, lecterns, and above all, its marvellous triple brass arch of lights stretching across the chord of the apse is a perfect revelation. Charming, too, is the cloister, from whose north-east corner the church, with its imposing clerestory of flowing Decorated windows, flying buttresses, pinnacles and pair of massive Romanesque towers, each surmounted by an octagonal slate spire, forms an architectural group of no common grandeur. Returning to Cleves the same evening, somewhat fatigued but highly delighted with our day, we quit it on Monday for Cologne, little of ecclesiological interest occurring to claim the attention until Neuss is reached. But of this old walled town, with its solemn transverse triapsal church of St. Quirinus, the first of that grand series of Rhenish examples, I have spoken at some length in the "Ecclesiologia Germanica," so further allusion need not be made either to it or to Cologne, which it is pleasant to revisit, firstly for the introduction to its manifold treasures of my *compagnons de voyage*, and secondly for the visiting on my own part of such objects as contrived to elude observation, and for the further study of those whose acquaintance had been but imperfectly made on former visits.

At Bonn the interior of the minster has lately undergone lavish decoration in fresco and stained-glass; consequently the

change that has been wrought in it since I last saw it nine years ago, when the only colour was afforded by some commonplace stained-glass in the apse of the upper choir—whose Romanesque windows, by the way, have, Peterborough fashion, been filled with Late Pointed tracery—is very striking. Whether the mural colouration is in harmony with the architecture it enriches, and which, truth compels me to add, it in places obscures, may be questioned, for with respect to this mode of decoration differences of opinion exist which it is impossible to reconcile; but one cannot blame the authorities at Bonn for wishing to impart to the interior of their minster an air of greater religiosity and impressiveness. It must, however, be conceded that the painted glass which has been placed in the windows of the apsidal transepts and in the large foliated half-circles which light the aisles is among the best modern work that has come under my notice in Germany.

The interior of the nave at Bonn is more like our Anglo-Romanesque, as exemplified at Chichester, than German work—a resemblance which must be attributed to the employment of one arch between each vaulting bay, instead of the two so universal in such contemporary German Romanesque churches as Bamberg, Naumburg and Osnabrück. The floor-space at Bonn being ample, the Männerchor does not appear; in its place, therefore, we have an arcade of five small arches opening into a narrow triforium passage, while the clerestory space is relieved by a quintuplet of graceful arcades, so that the blank spaces which occur when the ordinary German mode of fenestration by one or two small roundheaded windows is employed, are satisfactorily got rid of.

Portions of the cloister on the south side of the nave exhibit fine Romanesque work, but at the time of our visit the walks were cumbered with the pseudo-classical instrumenta removed from the choir and other parts during the late restorations.

Andernach, Sinzig, Coblentz, Boppart, Oberwesel and Bacharach, with their severally peculiar ecclesiological treasures, having come and gone, a most enjoyable trip is made by steamboat to Mayence, where we arrive in the evening, to find its streets gaily decorated in honour of the Kaiser's visit, and the red sandstone steeples of the Dom glowing in the last rays of sunset. Much as I should like to do so it is impossible, in the limits imposed upon me in this paper, to dilate upon this most solemn and awful of Rhenish Romanesque basilicas.

There is an apse at either extremity, but singularly enough the later and richer apse, a truly noble and typical example of the Rhenish style, faces west.

Here the basilican arrangement of the altar is found, and ranged behind it in the apse, where elongated Romanesque lancets have tolerable modern stained-glass, are the stalls of the chapter, exhibiting all the voluptuousness characteristic of eighteenth-century work. The nave, of unusual width, is separated from the aisles by square pillars supporting arches without archivolts. In lieu of triforium there is a wall, relieved by two lofty blind arcades decorated with modern frescoes of very jejune character, and surmounted by a clerestory of simple roundheaded windows.

Opening from the nave aisles are good Decorated chapels, whose tall windows have been filled with excellent stained-glass, the subjects being single effigies of saints placed low down in the lights, and with the superimposed space of white glass. Against the solid nave piers are arranged the monumental slabs of the archbishop electors of Mayence, whose effigies form an historical epitome of ecclesiastical costume highly valuable to the student. Several of these slabs are shown in the very charming drawing by Mr. Young, and the presence of those ranged down the great central nave serve in no small degree to impart an additional solemnity to the eight o'clock People's Mass, which we make a point of attending on the Sunday morning of our visit. The congregation, however, although it is sufficient to fill the benches, does not attain those vast dimensions which one may see any Sunday in the year at Cologne, Münster or Soëst. Travelling arrangements preclude our attendance at the later Mass, when unaccompanied music of the Palestrina school may be heard, but we visit two other churches in the city, St. Stephen's and St. Quentin's, both Middle Pointed and fine examples of the "hall" church, the latter, wonderfully set upon the site intended for it, being capable of accommodating a vast congregation in a space comparatively limited.

Returning to Coblentz we quit that admirable point de départ in the evening of an intensely hot Sunday for Trèves, and truly delightful in the afterglow is the apparently unending chain of mountains as the train pursues its course along the valley of the Moselle, whose stream in many places is shrunk to a mere riband, or so shallow that it might be crossed on foot. Excellent accommodation is found at the Hotel Stadt Venedig—a capital place for greedy little boys to go to, as they give you two helpings of each dish at table d'hôte—and we devote the whole of Monday to the exploration of Trèves and its ecclesiastical and civil antiquities. The exterior of the cathedral has been much impaired during the seventeenth century, particularly as regards its fenestration; but the whole mass, especially the western façade, with its simple apse and the adjacent Liebfrau Kirche, forms an ensemble which equals, if it does not surpass, our expectations.

Passing into the great cool Dom, the arrangement of whose Pointed nave arcades, alternately narrow and wide, and surmounted by a clerestory of rich Romanesque triplets, recalls Münster, we are agreeably surprised to find that it has up to the present escaped the fresco painter, walls, piers and vaults being perfectly bare, but none the less religious and solemn on that account.

The western apse is unfortunately choked by an immense organ-loft of frigid Ionic character, and the eastern apse would, I opine, have had a far more pleasing effect had its architect omitted the range of clerestory windows; and the vaulting is very weak and unsatisfactory. The parclose screens, which whilom doubtless extended the whole width o the transepts, as at Münster, resemble those in the choir of St. George, at Limburg on the Lahn; the grand elevation of the choir, which at the time of our visit is in a state of bouleversement, its floor being "up," thus allowing of a view of the vaults below; the extensive cloisters, and the contiguous Liebfrau Kirche all in their turn command our admiration. This last, noteworthy as among the few churches built in the complete Gothic style in Germany during the first half of the thirteenth century, perfectly free from Romanesque influence, although apparently of complex arrangement, is in reality exceedingly simple. Looked at for the first time the ground-plan may be described as dodecagonally apsidal, but closer inspection will reveal the fact that the church is built in the form of a Greek cross, the angles between the arms being on every side occupied by chapels. It originally communicated with the Dom by a vaulted passage called the Paradise, but which now forms the sacristy. The great piers at the crux, above which rises a low tower with hipped gabled roof, are composed of a core with four slender shafts disposed around it, the column separating the two arches opening into the aisle of each of the four limbs being a simple cylindrical one, with a delicately foliaged cap. All the windows are of two uncusped lights, with a sexfoiled circle like those in the chapels of Westminster and Beauvais, and one equipped with modern painted glass of Belgian manufacture, which forms the only blemish in an otherwise tastefully restored interior. Nothing can exceed in gracefulness the play of lines afforded by these columns and arches in the Liebfrau Kirche at Trèves. Like accomplished dancers at a ball, each seems to fall into its proper position as the visitor moves about the building. Upon the western side of each column is the frescoed effigy of an apostle, with beneath him, according to Mediæval custom, a sentence from the Creed. Standing just within the west door the whole of these paintings are visible at a *coup d'œil*.

From Trèves we go to Metz, and thence through Namur and Brussels to Antwerp, whence, after a day spent amid its manifold delights, we return with minds and portfolios stored with memories of a tour whose enjoyment would have been enhanced had the heat been less oppressive.

T. F. BUMPUS.

Lord Pirbright has decided to erect at Pirbright, adjoining the fountain which he presented to the village in commemoration of Her Majesty's Jubilee, a spacious hall for the use and recreation of the inhabitants.

THE STONES OF ENGLAND.

SIXTY years have elapsed since the report to the Commissioners of Works on the stone which it was proposed to employ in the Houses of Parliament was sent in. Copies are now almost unobtainable unless at a high price. It may therefore be interesting to reprint a document of which the conclusions are still true. The inquiry was carried out and undertaken under the authority of the Lords Commissioners of Her Majesty's Treasury by Mr. Charles Barry, Mr. H. T. de la Beche, F.R.S., F.G.S., Mr. William Smith, D.C.L., F.G.S., and Mr. Charles H. Smith:—

My Lord and Gentlemen,—In conformity with your instructions we have the honour to report that in the months of August, September and October last we made a tour of inspection to various stone quarries in the kingdom, and visited numerous public buildings, with a view to the selection of a proper stone to be employed in the erection of the new Houses of Parliament. We have also, in further compliance with your instructions, procured a fair average specimen of the workable stone from each of the quarries which we have visited, and have deposited cubes prepared from such specimens, as well as from others which have been forwarded to us, in the Museum of Economic Geology.

From the number of quarries which we have visited, we consider that we have been enabled to obtain a competent knowledge of the varied character of each of the several classes of building stone in the kingdom which are likely to be suited to the object in view, although we are well aware that there are many other freestone quarries in various parts of the country which we have not examined, where stone of different varieties, in some cases, perhaps, not inferior to those which have been brought under our immediate inspection, may be obtained. From many of such last-mentioned quarries we have received specimen blocks, and the requisite information concerning them, since the completion of our tour. We have not considered it necessary to extend our inquiry to granites, porphyries and other stone of similar character, on account of the enormous expense of converting it to building purposes in decorative edifices, and from a conviction that an equally durable and more eligible material could be obtained for the object in view from among the limestones or sandstones of the kingdom. We have, nevertheless, to acknowledge the receipt of several specimens of granite, among which are some from the estates of the Marquis of Breadalbane, near Oban, in the west of Scotland, accompanied by a munificent offer on the part of his lordship that, should the granite from that locality be considered fit and available for the proposed new Houses of Parliament, he would be willing to make a free gift to the nation of his interest in any quantity that might be required for the purpose.

In order to render more complete the inquiry upon which we have been engaged, we have availed ourselves of the valuable assistance of Professors Daniell and Wheatstone, of King's College, London, in determining the physical properties of a large proportion of the specimens which we have obtained.

In proof of the necessity and importance of the inquiry upon which we have been engaged, the lamentable effects of decomposition observable in the greater part of the limestone employed at Oxford, in the magnesian limestone of the minster, churches and other public buildings at York, and in the sandstones of which the churches and other public buildings in Derby and Newcastle are constructed, afford, among numerous other examples, incontestable and striking evidence. The unequal state of preservation of many buildings, often produced by the varied quality of the stone from the same quarry employed in their construction, shows the propriety of a minute examination of the quarries themselves, in order to acquire a proper knowledge of the particular beds from whence the different varieties have been obtained. An inspection of quarries is also desirable for the purpose of ascertaining their power of supply, the probable extent of any given bed, and many other matters of practical importance.

It frequently happens that the best stone in quarries is often neglected, or only in part worked, from the cost of bareing and removing those beds with which it may be associated; and, in consequence, the inferior material is in such cases supplied, especially when a great order is required to be fulfilled in a short space of time and at an insufficient price, which is often the case with respect to works undertaken by contract.

As the supply of stone in particular localities would often appear to be due to accidental circumstances, such as the cost of quarrying, the degree of facility in transport, and the prejudice that generally exists in favour of a material which has been long in use; and as the means of transport have of late years been greatly increased, it becomes essential to ascertain whether better materials than those which have been employed in any given place may not be obtained from other although more distant localities, upon equally advantageous terms. The decomposition of stones employed for building purposes appears to be effected by chemical and mechanical causes, according to the conditions under which such stones were placed. With reference to sandstones, such as are usually employed for building purposes, and which are generally composed of either quartz or silicious grains cemented by silicious, argillaceous, calcareous or other matter, their decomposition is effected according to the nature of the cemented substance, the grains being comparatively indestructible. With respect to limestones composed of carbonate of lime, or the carbonates of lime and magnesia, either nearly pure or mixed with variable proportions of foreign matter, their decomposition depends, other things being equal, upon the mode in which their component parts are aggregated, those which are most crystalline being found to be the most durable, while those which partake least of that character suffer most from exposure to atmospheric influences.

The varieties of limestones termed oolites, being composed of oviform bodies cemented by calcareous matter of a varied character, will of necessity suffer unequal decomposition unless such oviform bodies and the cement be equally coherent. Those limestones which are usually termed "shelly," from being chiefly formed of either broken or perfect fossil shells cemented by calcareous matter, suffer decomposition in an unequal manner in consequence of the shells, which, being for the most part crystalline, offer the greatest amount of resistance to the decomposing effects of the atmosphere.

Sandstones, from the mode of their formation, are very frequently laminated, more especially when micaceous, the plates of mica being generally deposited in planes parallel to their beds. Hence, if such stone be placed in buildings at a right angle to its natural bed, it will decompose in flakes according to the thickness of the laminæ; whereas, if it be placed upon its natural bed, the amount of decomposition will be comparatively immaterial.

Limestones, from the general mode of their formation, are not liable to the kind of lamination observable in sandstones; nevertheless, varieties exist, especially those usually termed shelly, which have a coarse laminated structure, generally parallel to the planes of their beds, and therefore the same precaution in placing such stone in buildings upon its natural bed is as necessary as with the sandstones above noticed.

The effects of the chemical and mechanical causes of the decomposition of stone in buildings are greatly modified according as such buildings may be situated in town or country. The state of the atmosphere in populous smoky towns produces a greater amount of decomposition in buildings so situated, all other conditions being equal, than in those placed in an open country, where many of the aeriform products which arise from such towns, and are injurious to buildings, are not to be found.

The chemical action of the atmosphere produces a change in the entire matter of the limestones, and in the cementing substance of the sandstones, according to the amount of surface exposed to it. The mechanical action due to atmospheric causes occasions either a removal or a disruption of the exposed particles; the former by means of powerful winds and driving rains, and the latter by the congelation of water forced into or absorbed by the external portions of the stone. These effects are reciprocal, chemical action rendering the stone liable to be more easily affected by mechanical action, which latter, by constantly presenting new surfaces, accelerates the disintegrating effects of the former.

Buildings in this climate are generally found to suffer the greatest amount of decomposition on their southern, south-western and western fronts, arising, doubtless, from the prevalence of winds and rains from those quarters; hence it is desirable that stones of great durability should at least be employed in fronts with such aspects.

Buildings situated in the country appear to possess a great advantage over those in populous and smoky towns, owing to lichens, with which they almost invariably become covered in such situations, and which, when firmly established over their entire surface, seem to exercise a protective influence against the ordinary causes of the decomposition of the stone upon which they grow.

As an instance of the difference in degree of durability in the same material, subject to the effects of the atmosphere in town or country, we may notice the several frustra of columns and other blocks of stone which were quarried at the time of the erection of St. Paul's Cathedral in London, and are now lying in the island of Portland, near the quarries from whence they were obtained. These blocks are invariably found to be covered with lichens, and although they have been exposed to all the vicissitudes of a marine atmosphere for more than 150 years, they still exhibit beneath the lichens their original form, even to the marks of the chisel employed upon them, whilst the stone which was taken from the same quarries (selected, no doubt, with equal if not greater care than the blocks alluded to) and placed in the cathedral itself, is, in those parts which are exposed to the south and south-west winds, found in many instances to be fast mouldering away.

Colour is of more importance to the selection of a stone for a building to be situated in a populous and smoky town than

for one to be placed in an open country, where all edifices usually become covered, as above stated, with lichens; for although in such towns those fronts which are not exposed to the prevailing winds and rains will soon become blackened, the remainder of the building will constantly exhibit a tint depending upon the natural colour of the material employed.

Before we proceed to adduce a few examples of the present condition of the various buildings that we have examined, we would wish to observe that those which are highly decorated, such as the churches of the Norman and Pointed styles of architecture, afford a more severe test of the durability of any given stone, all other circumstances being equal, than the more simple and less decorated buildings, such as the castles of the fourteenth and fifteenth centuries, inasmuch as the material employed in the former class of buildings is worked into more disadvantageous forms than in the latter as regards exposure to the effects of the weather; and we would further observe that buildings in a state of ruin, from being deprived of their ordinary protection of roofing, glazing of windows, &c., constitute an equally severe test of the durability of the stone employed in them.

As examples of the degree of durability of various building stones in particular localities, the following may be enumerated. Of the sandstone buildings which we examined we may notice the remains of Ecclestone Abbey, of the thirteenth century, near Barnard Castle, constructed of a stone closely resembling that of the Stenton Quarry, in the vicinity, as exhibiting the mouldings and other decorations, even to the dog's tooth ornament, in excellent condition. The circular keep of Barnard Castle, apparently also built of the same material, is in fine preservation. Tintern Abbey may also be noticed as a sandstone edifice that has to a considerable extent resisted decomposition; for although it is decayed in some parts, it is nearly perfect in others. Some portions of Whitby Abbey are likewise in a perfect state, whilst others are fast yielding to the effects of the atmosphere. The older portions of Ripon Cathedral, constructed of sandstone, are in a fair state of preservation. Rivaulx Abbey is another good example of an ancient sandstone building in a fair condition. The Norman keep of Richmond Castle, in Yorkshire, affords an instance of a moderately hard sandstone, which has well resisted decomposition.

As examples of sandstone buildings of more recent date, in a good state of preservation, we may mention Hardwicke Hall, Haddon Hall, and all the buildings of Cragleith stone in Edinburgh and its vicinity. Of sandstone edifices in an advanced state of decomposition we may enumerate Durham Cathedral, the churches at Newcastle-upon-Tyne, Carlisle Cathedral, Kirkstall Abbey and Fountains Abbey. The sandstone churches of Derby are also extremely decomposed, and the church of St. Peter's at Shaftesbury is in such a state of decay that some portions of the building are only prevented from falling by means of iron ties.

As an example of an edifice constructed of a calciferous variety of sandstone we may notice Tisbury Church, which is in unequal condition, the mouldings and other enrichments being in a perfect state, whilst the ashlar, apparently selected with less care, is fast mouldering away.

The choir of Southwell Church, of the twelfth century, may be mentioned as affording an instance of a magnesio-calciferous sandstone, resembling that of Mansfield, generally in good condition after long exposure to the influences of the atmosphere.

Of buildings constructed of magnesian limestone we may mention the Norman portions of Southwell Church, built of stone similar to that of Bolsover, and which are throughout in a perfect state, the mouldings and carved enrichments being as sharp as when first executed. The keep of Conisburgh Castle, built of a magnesian limestone from the vicinity, is also in a perfect state, though the joints of the masonry are open in consequence of the decomposition and disappearance of the mortar formerly within them. The church at Hemmingborough, of the fifteenth century, constructed of a material resembling the stone from Huddlestone, does not exhibit any appearance of decay. Tickhill Church, of the fifteenth century, built of a similar material, is in a fair state of preservation. Huddlestone Hall, of the sixteenth century, constructed of the stone of the immediate vicinity, is also in good condition. Roche Abbey, of the thirteenth century, in which stone from the immediate neighbourhood has been employed, exhibits generally a fair state of preservation, although some portions have yielded to the effects of the atmosphere.

As examples of magnesian limestone buildings in a more advanced state of decay, we may notice the churches at York and a large portion of the minster, Howden Church, Doncaster old church and others in that part of the country, many of which are so much decomposed that the mouldings, carvings and other architectural decorations are often entirely effaced.

We may here remark that, as far as our observations extend, in proportion as the stone employed in magnesian limestone buildings is crystalline, so does it appear to have resisted the decomposing effects of the atmosphere; a conclusion in accordance with the opinion of Professor Daniell, who has stated to us that from the results of experiments he is of opinion that "the nearer the magnesian limestones approach to equivalent proportions of carbonate of lime and carbonate of magnesia, the more crystalline and better they are in every respect."

Of buildings constructed of oolitic and other limestones we may notice the church of Byland Abbey, of the twelfth century, especially the west front, built of stone from the immediate vicinity, as being in an almost perfect state of preservation. Sandysfoot Castle, near Weymouth, constructed of Portland oolite in the time of Henry VIII., is an example of that material in excellent condition; a few decomposed stones used in the interior, and which are exceptions to this fact, being from another oolite in the immediate vicinity of the castle. Bow and Arrow Castle and the neighbouring ruins of a church of the fourteenth century, in the island of Portland, also afford instances of the Portland oolite in perfect condition. The new church in the island, built in 1766 of a variety of the Portland stone termed roach, is in an excellent state throughout, even to the preservation of the marks of the chisel.

Many buildings constructed of a material similar to the oolite of Ancaster, such as Newark and Grantham churches and other edifices in various parts of Lincolnshire, have scarcely yielded to the effects of atmospheric influences. Windrush Church, built of an oolite from the neighbouring quarry, is in excellent condition; whilst the Abbey Church of Bath, constructed of the oolite in the vicinity of that city, has suffered much from decomposition; as is also the case with the cathedral, St. Nicholas and St. Michael's churches, in Gloucester, erected of a stone from the oolitic rocks of the neighbourhood.

The churches of Stamford, Ketton, Colley Weston, Kettering and other places in that part of the country, attest the durability of the shelly oolite termed Barnack Rag, with the exception of those portions of some of them for which the stone has been ill-selected. The excellent condition of those parts which remain of Glastonbury Abbey show the value of a shelly limestone similar to that of Doulting; whilst the stone employed in Wells Cathedral, apparently of the same kind, and not selected with equal care, is in parts decomposed. The mansion, the church and the remains of the abbey at Montacute, as also many other buildings in that vicinity, constructed of the limestone of Ham Hill, are in excellent condition. In Salisbury Cathedral, built of stone from Chilmark, we have evidence of the general durability of siliciferous limestone, for although the west front has somewhat yielded to the effects of the atmosphere, the excellent condition of the building generally is most striking.

In the public buildings of Oxford we have a marked instance both of decomposition and durability in the materials employed, for whilst a shelly oolite similar to that of Taynton, which is employed in the more ancient parts of the cathedral, in Merton College, chapel, &c., and commonly for the plinths, string-courses and exposed portions of the other edifices in that city, is generally in a good state of preservation, a calcareous stone from Heddington, employed in nearly the whole of the colleges, churches and other public buildings, is in such a deplorable state of decay that in many instances all traces of architectural decoration have disappeared, and the ashlar itself is in many places deeply disintegrated.

In Spofforth Castle we have a striking example of the unequal decomposition of two materials—a magnesian limestone and a sandstone, the former employed in the decorative parts and the latter for the ashlar or plain facing of the walls. Although the magnesian limestone has been equally exposed with the sandstone to the decomposing effects of the atmosphere, it has remained as perfect in form as when first employed, while the sandstone has suffered considerably from the effects of decomposition.

In Chepstow Castle may be observed a magnesian limestone in fine preservation, and a red sandstone in an advanced state of decomposition, both having been exposed to the same conditions as parts of the same archways; and in Bristol Cathedral we have a curious instance of the effects arising from the intermixture of very different materials, a yellow limestone and a red sandstone, which have been indiscriminately employed both for the plain and decorative parts of the building. Not only is the appearance in this case unsightly, but the architectural effect of the edifice is also much impaired by the unequal decomposition of the two materials, the limestone having suffered much less from decay than the sandstones.

Judging, therefore, from the evidence afforded by buildings of various dates, there are many varieties of sandstone and limestone employed for building purposes which successfully resist the destructive effects of atmospheric influences; among these, the sandstones of Stenton, Whitby, Tintern, Rivaulx and Craigleith, the magnesio-calciferous sandstones of Mansfield, the calciferous sandstone of Tisbury, the crystalline magnesian limestones, or dolomites, of Bolsover, Huddlestone and Roche Abbey, the oolites of Byland, Portland and

Ancaster, the shelly oolites and limestone of Barnack and Ham Hill, and siliciferous limestone of Chilmark, appear to be amongst the most durable. To these, which may be all considered as desirable building materials, we are inclined to add, though they may not always have the evidence of ancient buildings in their favour, the sandstones of Darley Dale, Humbie, Longannet and Crowbank, the magnesian limestones of Robin Hood's Well and the oolite of Ketton.

If, however, we were called upon to select a class of stone for the more immediate object of our inquiry, we should give the preference to the limestones, on account of their more general uniformity of tint, their comparatively homogeneous structure, and the facility and economy of their conversion to building purposes; and of this class we should prefer those which are most crystalline.

In conclusion, having weighed to the best of our judgment the evidence in favour of the various building stones which have been brought under our consideration, and freely admitting that many sandstones as well as limestones possess very great advantages as building materials, we feel bound to state that for durability, as instanced in Southwell Church, &c., and the results of experiments; for crystalline character, combined with a close approach to the equivalent proportions of carbonate of lime and carbonate of magnesia, for uniformity in structure, facility and economy in conversion, and for advantage of colour, the magnesian limestone or dolomite of Bolsover Moor and its neighbourhood is, in our opinion, the most fit and proper material to be employed in the proposed new Houses of Parliament.

We have the honour to be, my Lord and Gentlemen,
Your very humble and obedient servants,
(Signed) CHARLES BARRY.
H. T. DE LA BECHE.
WILLIAM SMITH.
CHARLES H. SMITH.

TESSERÆ.

Mediæval Adaptation of Buildings to Sites.

WITHOUT speaking of the very lively appreciation of nature to be found in the numerous romances of the Middle Ages, we see the castles, the manors, the abbeys are always so situated as to give their inhabitants views of the surrounding country. Their construction harmonises with these localities: wild and imposing in abrupt places, fine and elegant at the foot of laughing slopes, on the banks of tranquil rivers, in the midst of verdant plains. In these houses the views of the most picturesque points are always arranged with skill and in such fashion as to present unexpected and varied aspects. In studying the civil constructions of Mediæval times it is therefore necessary to take into consideration the locality, the nature of the climate, the site, for all these things exercise an influence on the builder. A building which is suitably arranged and constructed on a level site in a country of gentle and tranquil aspect would be ridiculous on the top of a savage cliff surrounded by precipices. Another one by its severe and even harsh character seems to grow out of the desolate soil where it rises, but would appear deformed and coarse surrounded by fields and meadows. Those barbarous men, as they are considered by most people, were then sensible to natural beauties, and their dwellings reflected, so to speak, these different sorts of beauty, harmonised with them. We, who are civilised and pretend to have invented the picturesque, build elegant pavilions on some rustic site which seems to have been intended to carry a fortress, and we build massive structures on the bank of a streamlet running through a meadow. This would lead us to believe that these Mediæval barbarians loved and understood nature without making much ado over it, and that we, who boast of it on every occasion in prose and verse, look at it with a careless eye, without being sensible to its beauties. Centuries are like individuals, they wish always to be considered gifted with the qualities which are wanting in them, and care very little for those which they do possess. Everybody fought for religion in the sixteenth century, and nine-tenths of the combatants on both sides were unbelievers. They prided themselves on chivalry and on refined manners in the sixteenth century, and their minds turned very strongly, even at that epoch, towards positive ideas and the satisfaction of material wants. In the eighteenth century they conversed only about virtue, nature, gentle philosophy, when virtue was scarcely in vogue, when nature was looked at through the glazed window of one's chamber, and in lieu of gentle philosophy the only sort which was practised was founded on the assured well-being of one's self and one's friends.

The Parthenon.

The Parthenon has gathered into itself all the best points of Greek architecture; it has studied harmony of proportions, delicacy of feeling in optical corrections, exquisite taste in selection of mouldings, coloured ornaments and unrivalled sculpture. Take away the sculpture and some accidental grace were gone; but the building in all its transcendent beauty would remain as single and specious as a statue. Take away the sculpture and its air of sublimity would remain in the sheer weight and vigour of its masses and in the colossal scale of its architectural forms; its air of grace would remain in the modulated harmony and exquisite perfectness of its related parts; its air of intellectuality would remain in the austere majesty of its conception, its air of religious awe would remain in the mystery and poetry that its author communicated to his work by means that he knew so well how to wield. Think of the expressiveness of the structure as the broad rays of rising or setting sun beat aslant the clerestory in the roof upon massive columns or undivided weight of solid wall, and threw the unlit parts into gloomy shade. Think of the small scale of the sculptures—the noble frieze, for instance, is but 3 feet 4 inches deep—and compare this with the impressiveness of mighty mouldings and of columns whose abacus is 6 feet 5 inches square and diameter 5 feet at the top. It is the glory of a great building that it is one grand indivisible whole; take away the sculpture and some accidental grace is gone, some emphasis of parts is lost; but the primary quality, the central sweetness of the thing, remains. On the other hand, if a structure retains its expression, even though you remove its accessory of figure sculpture, it is different with the sculpture that is removed. The figures formed part of the very masonry of the structure. They emphasised its parts. The glory that they had was a communicated glory. The music that they made was only a part of a grand chorus, a share in the pervading harmony of the fabric that the master musician had blended with the melody and rhythm of the rest of the related parts. The music was not theirs, for it would go on still in the fabric, and with little perceptible difference, when the figures were gone. But removal makes all the difference to the figures; their inherent loveliness remains, but they become in a manner dumb, and remove them from the pediment or pedestal or niche to which they are allied and they wear an orphaned appearance like poor casuals without a home.

Variations in Greek Vegetation.

The following species from the flora known to Theophrastus have either entirely disappeared from Greece, or have emigrated from the habitations which he assigns to them, and withdrawn into the moister climate of more northerly regions—the varieties commonly known to the ancients of the lindens; the yew, that child of damp and shady hillsides, of which rare and dwarfed specimens only are now to be found on the highest mountains; the hornbeam, the beech and alder of Homer; and, with scanty exceptions, the "spear-furnishing" cornel and the tall ash. Instead of these another class of plants has conquered for itself greater space in the vegetable realm—thick-leaved, hard-leaved, down-covered, thorny and prickly bushes, evergreen for the most part, and adding, by their rich flowers, great beauty to the spring. This vegetation, analogous to that of the American savannas and Asiatic steppes, has now replaced the ancient flowery meadows, resembling those of middle Europe, with wastes of heath and pines, carob trees and grey oleasters. Together with these we have the various kinds of arbutus, myrtle, oleander, philyreæ, pistachios, kermes oaks, rosemary, thyme and the flora of dry mountain regions in general.

Sketching Landscapes.

In sketching from nature, think it not enough that your eyes see what is before them. The mind's eye must also look out from that watch-tower, the sensorium, to command the wanderings of the other two, and to select and reject; hence may taste be termed the new eye, new sense, new perception. Poetry of nature, what is it? All nature is poetry, is full of it, yet may you not have the power to extract an atom. Question yourself well on this point, and if it be so, you are not of the art divine. When you sketch from nature, if you find, on examining your portfolio, you have brought back nothing but unmeaning views, and that it is a remembrancer of localities, as your almanack is of dates, there is so little dignity in your employment, it will not be amiss if you quit it. So, if you paint and do no more than work after such sketches, you are only fit to ornament snuff-boxes and to beautify an album. If you can see no poetry in nature beyond what is on the retina of your eye, you want the mind's eye to constitute the painter; you must be a poet, or discard the idea of the pursuit; you must have a convertible power and have enjoyed visions of fairyland; and you must people your pastoral, or your romantic, or your poetical, with beings that are not on the poor's books; you must remove, as it were, the curse from the earth and from man, for whose sake it was under it, separate the free bounties from slavish toil and labour, and from all idea of the dire punishment and necessity of "eating our bread by the sweat of our brows." Give your senses the charm of the *dolce far niente*; let the verdure be fit for the gentle feet of Astræa, still

blessing humanity with her intercourse. Always remember that repose is the beauty of landscape. The scene should be a poetical shelter from the world, and if in anything partaking of it, it should be only so much so as would show it to be a part and parcel of the "debatable land" that lies between fairyland and the cold waking world. As it is to be a shelter, remember rest, and let not the glorious sun himself act the impertinent intruder and stare you ever in the face like a Polyphemus, stationed in mid-heaven, hid with a cerulean curtain, all but his eye.

Illustrated Books.

The fashion of illustrating books is nearly coeval with the art of printing—indeed, so far as we know, with the art of writing. The love of representation is instinctive in our nature. What stirs our own souls we would fain body forth to others. We all acknowledge the force of the Horatian maxim, that we are more easily moved through the eye than through the ear. Men, women and children have always delighted in illustrated books, and will do so to the end of time. There is but one condition necessary, that the illustration represents something genuine, speaks of some effort of a living soul, and is not the product of mere handicraft dexterity. It is this which gives the charm to the illuminations of the old missals and chronicles, and which makes us never weary of looking at the rough woodcuts of the early masters of the art. They have something to tell us. They make us feel the presence of an active intelligence struggling, it may be, through great inexpertness of manipulation. There is life and symbolism in them; true thought or true feeling, or both; and consequently they will have a value as long as the paper and ink of which they are compounded hold together. Without such qualities no illustration deserves the name. It must harmonise with and throw light upon the book or it becomes an impertinence. There are cases, no doubt, where the very badness of the illustration makes us tolerant of it; but then they are such as Charles Lamb speaks of:—"The common editions of Shakespeare, by Rowe and Tonson, without notes, and with plates which, being so execrably bad, serve as maps or modest remembrancers to the text, and without pretending to any supposable emulation with it are so much better than the Shakespeare Gallery of Engravings, which did."

Coryot in Venice.

The travels of Thomas Coryot, which commenced in 1608, extended over France, Savoy, Italy, Switzerland, Germany and Holland. Through all these countries the genial old fellow trots along in a jovial, purposeless sort of way, seeking enjoyment, and taking care to find or make it for himself, and then passing it on to his readers seasoned with sound observations and a gravity which is often delightfully absurd. The description he gives of Venice is one continued note of admiration. He exhausts a good-sized vocabulary to find epithets to express his feelings about the city in general. He calls it a paradise, a Tempe, a most beautiful queene, and says:—"It yieldeth the most glorious and heavenly show upon the water that ever any mortal eye beheld; such a show as did ever ravish me with delight and admiration." So great and sincere was this admiration, he assures us that if there had been made to him "an offer of three or four of the richest manors in Somersetshire if he never should see Venice, or neyther if he saw it," the manors would have been rejected on such a condition. He falls in love with that essentially Venetian institution the balcony, or, as he calls it, the "very pleasant little tarrasse that jutteth or butteth out from the maine building, with many prety little turned pillars of marble to leane over." The bronze work round the wells receives his special commendation for the clusters of grapes and ivy berries, so "very artificially carved," and the fruit markets for the display of "plummes, figges, musk melons and apricockes." Even the eatables and drinkables come in for their share of praise. The oysters are "the best that ever I did eate in all my life, as greene as a leek and *gratissimi saporis et succi*," and the "Lagrime di Christo toothsome and delectable to the taste," so much so that he is inclined to echo the exclamation of the stranger who, on tasting it, cried, "Domine, cur non lachrymâsti in regionibus nostris?" He "thought there had not beene so rich a staires in Christendome" as the Giant's Stairs in the Ducal Palace, and ascending them he passes into the vast hall of the Palace, where he sees a picture of "Paradise with Christ and the Virgin Mary at the top thereof, and the soules of the believers on both sides, painted by a rare painter called Tintorettus, which is most curious and very delectable to behold." Whether you think this criticism correct or not, you will surely join with him in admiring the noble room, one end of which the painting occupies. Bare and deserted as it looks now, nothing in Venice is so strong a reminder of the past glories of the Republic as this hall. All round its walls her naval victories are painted, and from above her dukes look down on you, and follow you with grave eyes until perforce you become reverential, and try to prevent your boots creaking as you cross the venerable floor and feel a half suspicion that the snuffy custodian at the door is a retired doge.

The Abbey of Holyrood.

The history of this abbey is lost in that of the adjoining palace, although itself one of the most important of all the monastic institutions. Founded as a priory at an early age, it was restored from the neglect into which it had fallen by that "sair sanct for the croon," David I., whose unchecked enthusiasm for the ecclesiastics beggared the succeeding kings. Lying on the high road from England, it was at intervals demolished amid the ravages of war; rebuilt, and often and again destroyed, until at last it accompanied the other monasteries in their ruin at the Reformation. The walls of the chapel, propped up by modern repairs, are the sole remnant of the monastic pile that had been the scene of such eventful things. What crowding memories that old palace and that ruined chapel evoke! Could these walls speak, what a mingled story would they tell of the fate of monarchs! Plots, assassinations, high hopes destined to be withered, the despair of broken hearts, the wild extravagance of unbridled passions, the infatuation of a bigotry which taught religion by tyranny, and hoped to regenerate the land by proscribing the genius which immortalised it. It was in the old hall of that deserted palace that the heart of Mary, in the enthusiasm and buoyancy of her young days, leapt with gladness at the bright hopes of happiness in a marriage brought about by the passion of an hour. The small chamber is still there where she heard the wild yell of agony of her murdered secretary; and that marriage hall, so late the scene of festive gaiety, rang in a little time with the tumults of a populace, moved with the spectacle of a husband murdered at her palace gates, the victim of her fleeting and unstable passions. Hurried on by the wayward impulses of a mind ill-regulated; vain, capricious, and yet not destitute of an amiability and generosity of character that in more peaceful times might have wrought out her own and her country's happiness; that old hall again saw her give caresses as the price of blood, and, in utter mockery of the decencies of life, become the bride of one who had dug her husband's grave. That ruined chapel, too, is not without its history. There the chief stand was made by the most infatuated of her doomed race for the principles of Laud. It was here the struggle in Scotland first began. "In our chapel royal at Holyrood House," Charles wrote to the Lords of Session that they must participate in the communion after the order of the English Liturgy, "for we will not suffer you, who should precede others by your good example, to be leaders of our other subjects to contemn and disobey the orders of the Church." All is changed. The chapel is a ruin, and the green sward around it covers alike the graves of the oppressor and the oppressed, who found there a common resting-place. If in life there was no community in the opposing principles they professed, the bland amalgamation of the grave commingles into one heap their dust. The pomp of regal sovereignty is gone, and the deserted chambers only echo to the tread of the curious traveller, who comes to read the moral of their history.

The Colosseum.

Of all the ruins in Rome, none is at once so beautiful, so imposing and so characteristic as the Colosseum. Here throbbed the Roman heart in its fullest pulses. Over its benches swarmed the mighty population of the centre city of the world. In its arena, gazed at by a hundred thousand eager eyes, the gladiator fell, while the vast velarium trembled as the air was shaken by savage shouts of "Habet," and myriads of cruel hands, with upturned thumbs, sealed his unhappy fate. The sand of the arena drank the blood of African elephants, lions and tigers—of Mirmillones, Laqueatores, Retiarii and Andabatæ—and of Christian martyrs and virgins. Here emperor, senators, knights and soldiers, the lowest populace and the proudest citizens, gazed together on the bloody games, shouted together as the favourite won, groaned together fiercely as he fell, and startled the eagles sailing over the blue vault above with their wild cries of triumph. Here might be heard the trumpeting of the enraged elephant, the savage roar of the tiger, the peevish shriek of the grave-rifling hyæna; while the human beasts above, looking on the slaughter of the lower beasts beneath, uttered a wilder and more awful yell. Rome—brutal, powerful, bloodthirsty, imperial Rome—built in its days of pride this mighty amphitheatre, and, outlasting all its works, it still stands, the best type of its grandeur and brutality. What St. Peter's is to the Rome of to-day is the Colosseum to the Rome of the Cæsars. The Baths of Caracalla, grand though they be, sink into insignificance beside it. The Cæsars' palaces are almost level with the earth. Over the pavement where once swept the imperial robes now slips the gleaming lizard, and in the indiscriminate ruins of those splendid halls the contadino plants his potatoes, and sells for a "paul" the oxidised coin which once may have paid the entrance fee to the great amphitheatre. The golden house of Nero is gone. The very Forum where

Cicero delivered his immortal orations is all but obliterated, and antiquarians quarrel over the few columns that remain. But the Colosseum still stands; despite the assault of time and the work of barbarians it still stands, noble and beautiful in its decay—yes, more beautiful than ever.

Moulded Bricks in Italian Buildings.

Nothing more clearly marks the line which separates the good from the vulgar artist than the power which the former always retains to use and not abuse his material, or his opportunities for its free use. The good artist in brick values properly the use of moulded brick and terra-cotta, and uses them wherever he can do so safely and artistically. The bad artist seems, on the other hand, to rejoice in the endless profusion of ornament with which the cheap reproduction of moulded forms supplies him. And the consequence is, that in some of the fronts of the later Italian churches, we are annoyed and disgusted by the endless repetitions of features which would never otherwise have been marked at all. Such are the rich string-courses, and eaves and gable mouldings, which are everywhere to be seen, and which ought never to be imitated. They generally consist of several courses of moulded bricks, and frequently of continuous arcades of intersecting arches. In some districts, as for instance at Pisa and in Bologna, round discs of glass or earthenware are introduced in combination with these, and by the introduction of bright greens and blues among the sombre bricks, much richness is given to the work. In San Francesco, Bologna, these discs are inserted at intervals in the wall, under the gable cornices of the west front, whilst in the north steeple of San Francesco, at Pisa, they are inserted above the horizontal cornices or strings which divide its various stages. Many of the Italian cornices are so deep and complicated in their design as to astonish extremely those accustomed to the entire absence of so marked a horizontal line in our own English buildings. And their general effect seems to be not only un-English, but at the same time unpleasantly exaggerated; still the beauty of the detail is often very great, and they afford ample evidence of the kind of perfection attainable by means of the repetition of the same moulded forms.

The Pursuit of the Ideal.

The student mind first experiences certain inborn longings for a manifestation of the perfect, and casting a casual glance over nature, turns away unsatisfied. Again he looks deeper, and at length discovers the scattered indications of what he needs. Carefully bringing together the dismembered fragments, he gradually builds up the idol of his worship, and forms to himself the outward type and symbol of his ideal desires. But by the law of all noble minds, he aspires still higher; taking this mature form unto himself, he dwells with it, realises it, possesses it; at length he begins to feel within himself capacities for something still more perfect, and in midnight visions and noontide dreams the shadow of a better reality passes before his gaze. He awakens from his waking dreams, walks again the beauteous earth, finds that his eyes are opened afresh to perfections he had never seen before, and eagerly gathers new flowers and forms of beauty to adorn more richly the altar of his worship. Speedily he grows like unto that which he adores, but his insatiable desires still demand a higher perfection. Thus he presses onward, each realised type forming the basis of further spiritual growth, and leading to types still more matured. Thus, were it possible, man, through an infinite series, would reach an infinite perfection. In this race between the nature of man and the nature which lies around him, neither has ever exhausted the possibility of its resources, nor reached the ultimate goal which lies in the distance of infinity. Still hidden in the depths of nature, a deeper, nobler truth is slumbering than the artist has yet grasped, and in human nature lies a deeper, holier want than art has satisfied. The student who uses painting or sculpture as an instrument of mental advancement will thankfully rest for a season with forms of high and holy beauty; yet he turns at length away, asking for something still more excellent, and peoples the heaven of his imagination with a more beauteous perfection.

Continental Travel.

Once on the Continent the English traveller may combine the sense of security with pleasurable excitement. The more rapidly he moves, the more attractive will appear the passing pageant which unrolls itself before him. He sees it only in imposing masses; he has no time to dissect, to criticise, to get weary of details. The stately "star-y-pointing" cathedrals of France or Belgium first captivate his imagination, and lead back his thoughts into the sphere of devotional awe by their notions of vastness, their intermixture of gloom and splendour, and that harmonious unity of proportion which suggests the idea of a spontaneous growth rather than of slow architectural combination. The fenced cities and burghal halls of the Low Countries, uniting all the fretwork of ornament with the strength of fortresses, vividly recall the stirring times and civic contests out of which the frame of modern society has grown into form. The "chiefless castles breathing stern farewells" from every eminence bordering the majestic Rhine, which is bearing him onward to his destination, awaken a thousand legendary memories "of ladye-love and war, romance and knightly worth." As these recede, he finds himself, almost by dream-like transition, among the rocks and green valleys of Switzerland; he sees the shadows of the far-distant Alps reflected in the blue lake at his feet; he climbs that giant's staircase by which this mountain barrier is scaled. From the region of ice and snow he passes, as if by magic, into a clime of the sun. Milan receives him with all her historical memories, her libraries, her galleries of art, her unique and dazzling cathedral. He next sails between ranks of palaces along the watery streets of the Silent City, imbibing in kindred silence the peculiar charm of its quaint and waning magnificence. Florence spreads before him her uncounted treasures of art; Naples courts him with her joyous and luxuriant beauty, till the long-continued and delightful strain of emotion attains its climax as he treads, almost doubtful whether he can believe his vision realised, the streets of Rome.

Effect of Magnitude.

The æsthetic impression of magnitude depends upon the fact that the imagination attempts the total representation of the given object in vain, and this can only occur when the highest measure of magnitude which it can actually embrace at once, added to itself as many times as the intellect can actually comprehend in a conception, is too small for the object. But the result seems to be that objects of equal magnitude must also make an equally sublime impression, and that an object of less magnitude has the power to lessen this impression—which is contrary to experience. For, according to this, the part frequently appears sublimer than the whole, the mountain or the tower sublimer than the sky in which it rears itself, the cliff sublimer than the ocean whose waves foam around it. But we must here recollect the conditions, by virtue of which the æsthetic impression only ensues when the totality of the object employs the imagination. If the latter omits this with respect to the far greater object, and, on the contrary, observes it with the smaller, it may be æsthetically affected by the latter, and yet be insensible to the former. But if it conceives of the larger as a magnitude, it at the same time conceives of it as an unity, and then it must necessarily make an impression stronger in proportion as it exceeds the other in magnitude.

GENERAL.

Lord Iveagh has offered to place 1,000*l.* at the disposal of the authorities of St. Patrick's Cathedral, Dublin, to defray the expenses of the preliminary investigation, with the necessary scaffolding and shoring of the buttresses and flying arches, the cost of which Messrs. Thompson, of Peterborough, stated must be considerable, though they were unable to give a definite estimate of it. Mr. T. Drew, R.H.A, will have charge of the work.

The Annual Convention of the Ontario Association of Architects will take place on January 17 and 18.

The Montreal Real Estate Owners' Association at a recent meeting resolved to petition the City Council to pass a by-law compelling the uniform height of buildings to be erected in new streets. The object is to prevent depreciation in the value of buildings of moderate height by reason of the placing of tall buildings alongside them.

Mr. G. H. Andrews, who at one time gained some repute as a water-colour artist, died at Hammersmith on Saturday last in his eighty-second year. He served as treasurer of the Water-Colour Society during several years.

The Birmingham City Council on Tuesday approved the proposal to lease 9,890 square yards of land belonging to the Colmore Trustees for 999 years, as a site for the extension of the Municipal Buildings and especially the Art Gallery.

Lady Burne-Jones has informed the Birmingham City Council that she has bequeathed to the Municipal Art Gallery at her death the portrait of her deceased husband by Mr. G. F. Watts, R.A., on condition that it shall be placed among the late Sir Edward's own pictures.

We are Requested to state that Major Hector Tulloch, C.B. (retired), Royal Engineers, and lately chief engineering inspector of the Local Government Board, is not the person who was a director of the West Australian Trading Syndicate.

Hamblet's Blue Brick Company, Limited, announce that the warrants for the interest on the 4½ per cent. Mortgage Debentures to December 31, 1898, have been posted.

Mr. Perry F. Nursey, consulting engineer and technical expert, has removed his offices from 161 Fleet Street, London, to 17 Victoria Street, Westminster, S.W.

THE
Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xxi.

WINGATE.—Jan. 28.—For erection of a shop near Trimdon Station. Apply to the Secretary.

CALENDARS FOR 1899.

WE have received quite a batch of calendars for the new year, most of which are of the "tear-off" description, and this is perhaps the most convenient form in which these "mural decorations" can be presented. The monumental specimen sent in by the Rugby Portland Cement Company is a handsomely designed and well executed example of lithographic art, measuring some 24 by 30 inches, with brass-bound corners, and bearing picturesque views of the Company's quarries and factory, and others illustrating the different processes of manufacture. Very tasteful, if less conspicuous, is that sent in by Mr. Gooding, of North Road Works, Holloway, which is designed as a reminder of his interchangeable rubber stair-treads. The Sun Fire Office have a design of the great luminary rising over the Tower of London for their hanging calendar; and they also send a useful blotting-case and an elegant little pocket calendar. From the Accident Insurance Company, Limited, of 10 St. Swithin's Lane, London, E.C., we have received a wall calendar, in which the tear-off date indicator is a prominent and useful feature. The company was founded in 1849, and insures against accidents and disease, in addition to granting indemnities to employers under the Workmen's Compensation Act, &c. The Patent Victoria Stone Company have got up a really elaborate piece of desk furniture which comprises a calendar, a diary containing some well executed illustrations of the many uses to which the Company's stone can be applied, a well supplied blotting-pad and a scribbling-pad, the whole contained in a richly gilded cloth cover. Among the less ornate specimens may be mentioned those of the National Provident Institution, Messrs. Croggon & Co. and Messrs. Douglas Young & Co., all of which, if they make no particular claim to beauty, respond at least to every call on the score of utility.

THE work of the extension of Rothesay Pier, commenced in October last, has so far progressed that the first section providing a full berth at the east end was brought into use on the 31st ult. The royal mail steamer *Grenadier* had the honour of being the first mail steamer to come alongside the berth. She arrived about eleven o'clock, half an hour late, and though the weather was wet and stormy there was quite a crowd assembled to witness the inauguration. As the *Grenadier* cast her hawsers salutes were fired from on board and flags run up, while those assembled on the pier gave hearty cheers.

Mines and Mills—FAULD, near SUDBURY, N.S.B. AGENTS WANTED.

Soho Cowl & Ventilator

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

THE large hall erected at a cost of 3,000*l.* by the Peckham Liberal Club at the rear of their commodious new premises in Elm Grove was formally opened on Monday evening.

TRADE NOTES.

MR. JOHN GRUNDY'S system of heating, which has acquired such an excellent reputation in connection with the warming of churches, schools, &c., is now being applied with the happiest results to the theatre, ballroom, and, in fact, the whole of the extensive range of buildings erected in connection with the New Brighton Tower at New Brighton, near Liverpool, by the Tower and Recreation Company, Limited.

MESSRS. JOHN BOLDING & SONS, LIMITED, of Grosvenor Works, Davies Street, W., inform us that in addition to having purchased the stock, plant and goodwill of the late Mr. F. G. Underhay, which they will continue to carry on at the old address, Crawford Passage, Clerkenwell, they have also opened a new branch and extensive showrooms at 63 Witham Street, Dublin.

MESSRS. G. B. KENT & SONS, of Farringdon Road, are issuing a very useful little illustrated handbook or catalogue of the various brushes, tools and appliances manufactured by them for the use of painters, decorators and others.

MESSRS. T. W. F. NEWTON & CHEATLE, architects and surveyors, notify us that they have removed to their new offices, No. 39 Newhall Street, Birmingham.

THOSE of our readers who are in any way interested in the uses of asphalte would do well to get from the Limmer Asphalte Paving Company, 2 Moorgate Street, their "Practical Notes on the Manufacture and Uses of Limmer and Montrotier Seyssel Mastic Asphaltes," which will be found to be a neat and handy booklet, replete with useful information on the subject dealt with.

THE new temporary fever hospital, Knutsford, is being warmed and ventilated by means of Shorland's patent Manchester stoves.

THE pier committee of Dunoon recently met to consider what steps should be taken to repair the damage done to the southern entrance to Dunoon pier by the severe storm, and how best to safeguard this portion of the pier from further damage. After a free expression of opinion from the members present as to the course of action to be taken, the committee unanimously agreed to ask Mr. Copeland, C.E., Glasgow, the engineer for the pier, to report on the damage done and to suggest the best means of remedying the present defective corner of the concrete abutment on which the pay-box stands.

THE SANITARY WASHABLE DISTEMPER

For the Interior Decoration of ASYLUMS, CHURCHES, HOSPITALS, RAILWAY STATIONS, MANSIONS, and PRIVATE HOUSES.

Used by the L.C.C., the Corporation of the City of London, and other large Public Bodies at Home and Abroad.

TO ARCHITECTS, SURVEYORS, &c.

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent"), having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

ARCHITECTS SHOULD SPECIFY

CHING'S Patent Mica Valve Chimney Breast Ventilator, or CHING'S New Patent Silent Chimney Breast Ventilator.

TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM.

MACKIE'S PATENT "DEFIANCE" HYDRAULIC WATERTIGHT FLOOR SPRING AND CHECK.

Size of Plate, 12 × 8 in.

Size of Box, 10¾ × 6 × 3¾ in.

906 80/-

With top centre and brass shoe any size.

This Floor Spring is suitable for any sized door, and can be regulated to suit any force required.

The box is watertight and weatherproof, a distinct advantage when fixed in Banks, Board Schools, Libraries, and similar places, where the floors are frequently washed down.

It is also sent complete with an outer box to fix into floor, to facilitate the spring being taken out when necessary.

Working Models of these and other Specialties may be seen at our newly-fitted London Showrooms, 57 HOLBORN VIADUCT E.C. Architects and Buyers are respectfully invited to inspect same.

LONDON SCHOOL BOARD.

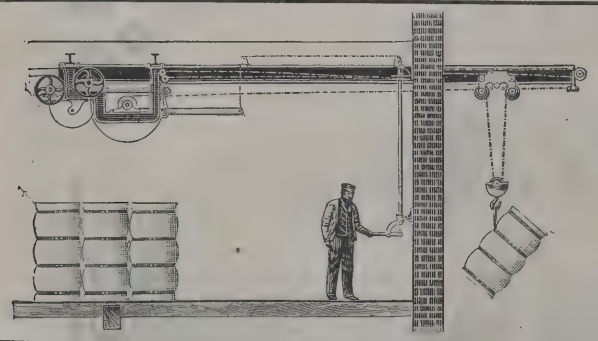
THE St. Pancras Vestry has laid electric-lighting mains for both public and private supplies up the West Hill, Highgate, and to the summit of Highgate Hill, and, as soon as the necessary connections are made, the current will be switched on. The top of Highgate Hill is the highest spot in the North of London to which electric-lighting mains have yet been carried. The cables, which were wound on huge drums, weighed several tons, and eight horses were required to haul each of them to the top of the hill. It is the intention of the Vestry to carry the cables down Highgate Hill to the St. Pancras Workhouse Infirmary in Dartmouth Park, though in order to do this it will be necessary to obtain the consent of the Islington Vestry, as some portions of the roads to be opened are under the control of that authority.

ELECTRIC NOTES.

IT has been decided that the judges' lodgings at Leeds are to have an installation of electric light.



THE Islington Vestry have decided to instruct the electric-lighting committee to advertise for firms willing to undertake the work of extending the electric-light station at a cost of 22,000*l.* In reply to questions the treasurer stated that there were 216 arc lamps in the parish, costing 6,822*l.* per annum, or 40*l.* 17*s.* 1*d.* per lamp, and that these had displaced 440 gas lamps, costing 1,747*l.* per annum.

THE Llanrwst Urban District Council at a special meeting passed the following resolution:—"That this Council will not oppose Messrs. J. R. Peers & Co, electrical engineers, applying to the Board of Trade for a provisional electric-lighting order for the town of Llanrwst, provided such application be made before November 1899, and that the works be carried out within six months from the date of the order, and subject also to the approval by the Council of the terms and details of such order."

IT has not taken the Leeds lighting committee very long to come to the conclusion that an extension of the electric lighting undertaking is desirable. The premises and plant only came into possession of the Corporation a few weeks ago, and already the Council have been asked to sanction the expenditure of 14,296*l.* upon further mains and accessories. At present the mains only supply the centre of the city, Chapeltown and Headingley. The lighting committee are desirous of forthwith carrying the current to Hunslet, where it is anticipated it will be utilised for illuminating many of the big engineering works in that locality. Further extensions in other parts of the city are also in contemplation, though they have not yet been definitely decided upon.

ON Saturday the undertaking of the Sheffield Electric Light Company was formally transferred to the Corporation of Sheffield in compliance with the deed of purchase. The Corporation was represented by Mr. Robert Styring (chairman of the newly-elected electric-light committee), the town clerk and the city accountant. The company was represented by Alderman Franklin (chairman), Alderman Gamble (a director) and Mr. Johnson (manager of the company). A cheque for 260,000*l.* was handed to Alderman Franklin, and in return Mr. Styring received the conveyances of different properties of the company, and formally took possession of them on behalf of the Corporation. Alderman Franklin then accompanied the

CORK PAVEMENT is NON-SLIPPERY, NON-ABSORBENT, NOISELESS.
Proved by over six years' experience under heavy road-traffic to be more durable than wood.
Recommended by the highest Authorities as the Best and most Sanitary Pavement for **Streets, Stables, Kennels, Yards, Basements, Church Aisles, &c.**, whether for outdoor work or under cover. Can be seen in London and the provinces in all above uses, Gold, Silver and Bronze Medals awarded, Brussels International Exhibition, 1897, for Hygienic Street and Stable Pavement. representatives of the Corporation to the Sheffield and Hallamshire Bank, when the current account of the company was transferred to the Corporation. During the week the shareholders will be paid out at the rate of 17*l.* 10*s.* for each 7*l.* share, with another instalment of about 10*s.* per share to follow. To meet these payments the Corporation has borrowed on easy terms 200,000*l.* from the Bank of England and the remainder from other sources. The tramways have done so well since they came under the Corporation, less than two years ago, that the committee hope to be able to hand over 12,000*l.* in relief of the district rate to be levied next March, and it is hoped that the electric light will prove an even more profitable source of revenue.

THE Glasgow University Engineering Society met in the engineering classroom to hear a lecture delivered by Mr. W. B. Sayers, on "The Economic Use of Electricity in Power Transmission and Distribution," Mr. Henry Mayor occupied the chair. Mr. Sayers discussed the question which is occupying the minds of many engineers, namely, under what conditions is it advantageous or economical to use electricity as a means of transmitting and distributing power? "This question," he said, "is a far more difficult one to answer than might appear at first sight, the reason being that the conditions upon which the answer depends vary between very wide limits, dependent chiefly upon the nature and amount of the work to be done and its location, the nature of the source of power and its cost, and, again, the distance of this source of power from the place where power is required. A further question is this, assuming that the conditions in a given case are favourable to the use of electricity, at what point shall the transformation into dynamical power be effected? The factors upon which our conclusion must be based are two—convenience and cost. Convenience expresses something which it is generally difficult or impossible to value in terms of pounds, shillings and pence; but, nevertheless, it would be difficult to exaggerate the importance of convenient arrangements in any manufacturing establishment. The difference between convenient and inconvenient arrangement is analogous to the difference between good and bad management. It is often the difference between success and failure, between profit and loss, for it must be borne in mind that the saving of time which is the inevitable result of improved convenience means not only reduced cost of production, but also increased capacity for output in a given time. The factor with which we have chiefly to do, however, is 'cost.' It has been indicated that improved convenience is worth paying for, but the question 'how much' can only be answered in any particular case by good judgment and intuitive insight into the issues involved, or often enough by expensive experience only. It stands to reason that if power is cheap and abundant we can afford to be less careful with it as regards waste than we can if it is dear or scarce; but at the same time it is a great mistake, yet one often made, to suppose that because the actual cost of the power is small, or even a negligible quantity, that therefore it does not matter how much of it is wasted. Thus the idea that coal and water can be used wastefully because they are cheap has led to the waste of the capital and revenue involved in providing, repairing and firing boilers which should not have been required at all. Cheap coal, as it often does, means dear power." A number of diagrams were shown showing the cost of energy derived from water, gas and electricity mains per horse-power hour in Glasgow and Edinburgh.

PATENT Victoria stone is now claimed as an invaluable building material, as it is made in most pleasing tints and is of great strength and durability—greater, in fact, than of much natural building stone; and to prove its popularity we give a few of the recent works being executed by the Company. For instance, there is the Yorkshire Grey, in that central and important thoroughfare Piccadilly, the whole front of which will consist of Victoria stone, now being made at their extensive London works at Stratford; then comes the immense depositories at Camden Street, for Messrs. Maple, for which they are executing thousands of cubic feet of cornices, strings, &c.; also a large mansion in Surrey, for which they are preparing the whole of the external architectural work, and many other similar buildings which space prevents our mentioning. We may, however, mention a few of the numerous works that have recently been carried out by them. For instance, on the south coast there is the Terriss Memorial Lifeboat House at Eastbourne, premises at Church Street, Brighton, and the Morley House Convalescent Home at St. Margaret's Bay, all of which have a really beautiful effect; in London there is the Thomas à Becket, in the Old Kent Road, the Latimer Arms at Notting Hill, 85 City Road, New Cottage Hospital at Woodford, 28 Great Marylebone Street; the Grand Hotel at Port Talbot, South Wales, &c., &c. In all above cases natural stone has been most beautifully matched, thus combining colour and durability.

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
OLD FORD, BOW, LONDON, E.

Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

BUILDING AND BUILDERS.

A CHURCH (St. James) is about to be erected in Falkirk at the corner of Thornhill Road and the new street at Firs. The building, of which Mr. G. Deas Page, Falkirk, is architect, will cost 4,000*l.* In the Gothic style, it is to be constructed of red stone from Locharbriggs Quarry, Dumfries.

PLANS for the building of the proposed Ardrossan and Saltcoats Joint Hospital were sent in by three competitors, namely, Messrs. Fryer & Penman, Largs; Guest Luckett, Glasgow; and Thomson & Sandilands, Glasgow. The firm first named was successful. The hospital is to cost 4,000*l.* or 5,000*l.*

AT the meeting of the Hull public libraries committee Sir James Reckett, Bart., in the chair, a letter was read from the Local Government Board sanctioning the borrowing of 6,774*l.* for the purchase of land as a site for the Central Free Library.

AT the monthly meeting of the Wolverhampton School Board to be held to-day, the general purposes committee will recommend that the tender of Mr. James Herbert, amounting to 2,238*l.*, be accepted for making additions and alterations to Red Cross Street school.

THE ancient parish church at Navestock, Essex (St. Thomas the Apostle), is in urgent need of restoration, and the vicar and churchwardens are making strenuous efforts to raise a fund sufficient for the purpose. This church was in existence at the time of William the Conqueror, and is very interesting from an antiquarian point of view.

A TENDER of over 10,000*l.* has been accepted for the erection of new buildings for the London and County Banking Company at the corner of Windmill Street and King Street, Gravesend.

IT has been decided to erect a new church, to be dedicated as the church of St. Paul, in that portion of the Fairhaven estate which falls within the parish of Lytham, Manchester. Mr. Clifton, of Lytham Hall, has given a site, valued at 1,400*l.*, for church, school and parsonage, and he proposes to add an endowment of 100*l.* per annum for the new benefice.

IT is proposed to make considerable alterations and improvements at the premises of the Smethwick Conservative Club in High Street, at an estimated cost of 500*l.* The scheme includes the erection of additional buildings at the rear of the existing block, which will be used as an assembly and billiard-room.

AT an influential and largely-attended meeting held at the Town Hall, Malmesbury, with the Duke of Beaufort in the chair, Mr. A. St. John Hope, secretary to the Society of Antiquaries, reported on the present condition of Malmesbury Abbey and on the work necessary for its preservation and restoration. In accordance with this report the Rev. G. Windsor Tucker, vicar of Malmesbury, moved a resolution that the work be undertaken. The cost is estimated at about 20,000*l.* This resolution was seconded by Sir John Dickson-Poynder, M.P. for the division, and carried unanimously. A committee was then formed to carry out the work.

THE proposed agreements between the Forfar and Dundee districts of the County Council of Forfar in reference to the proposed erection of a fever hospital for the use of both districts were approved of at a meeting of the Dundee district committee. By the agreement it has been settled that both districts will bear the cost of erection (4,500*l.*) in proportion to their respective populations, and the same rule is to obtain in the matter of the treatment of patients. The managing committee is to consist of three members from each committee, and all disputes are to be referred to the county clerk as sole arbitrator.

A SPECIAL meeting of the Barton Urban District Council was held on the 29th ult. to consider what action should be taken with respect to Mr. J. Charles, a Grimsby builder, who recently was fined 5*l.* for erecting a row of houses not in accordance with approved plans, and who had not since fulfilled the required conditions. An offer had been made to alter the roofs to the satisfaction of the surveyor, but the Council thought further proceedings should be taken to compel Mr. Charles to adhere to the plans. It was stated that Mr. Charles was liable to a penalty of 2*l.* per day whilst the work was proceeding.

THE foundation-stones of a new Wesleyan chapel at Foulsyke, near Abbey Town, have been laid. The want of such a building has long been felt, there being a considerable population in the hamlets of High Laws, Aldoth, and Pelutho (of which the site of the proposed building is a good centre), some miles from any place of worship. Successful meetings were for some time held in an adjoining farm kitchen. This being no longer available the present scheme was proposed, and being favourably received by those interested, plans were prepared for a chapel to seat 120. Mr. F. Grainger, of Southerfield, has given the site and also a handsome subscription. The contract has been let to Mr. William Robinson, of Blennerhasset.

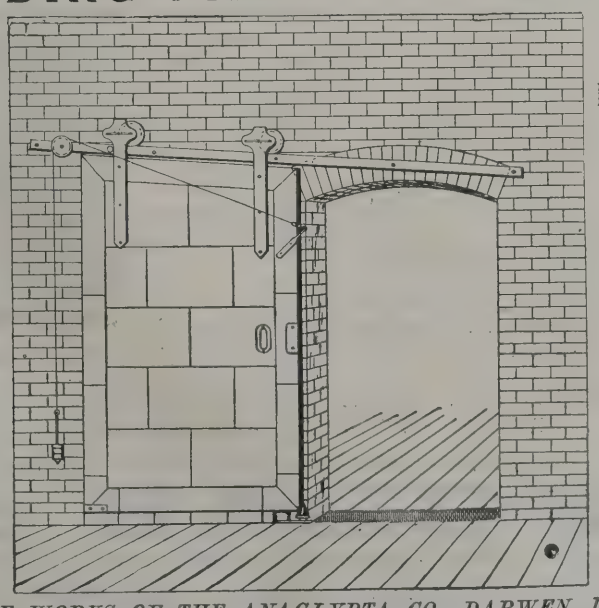
THE Elder Brethren of Trinity House have completed the preliminaries for the erection of a lighthouse and fog-signal station at Pendeen, a particularly dangerous point on the north coast of Cornwall between the Land's End and St. Ives, which has been the scene of many a shipping disaster. The tender of Mr. Arthur Carkeek, of Redruth, has been accepted, and the work has already been commenced, although as yet it is principally confined to excavations. The plans have been prepared by Mr. Matthews, the engineer of the Trinity Board, himself a Penzance man, who is well acquainted with the whole coast around the Land's End district.

THE construction of a suitable harbour and quay at Mallaig formed a vital part of the Mallaig Railway scheme, and the cost of this auxiliary undertaking was estimated at close upon 30,000*l*. It now appears that there are certain formidable and unforeseen engineering difficulties in the way of these projects being carried into execution. Past surveys, of more or less cursory character, seemed to have proved that the layer of sand forming the bed of Mallaig Bay was underlaid by a muddy or clayey formation. It was therefore concluded that the necessary process of deepening the area to be embraced in the proposed harbour would be not only feasible, but comparatively inexpensive. A more careful and precise survey has recently been made, and the result is likely to upset all former calculations. It now appears to be established that the three-foot layer of sand rests not upon a substratum of clay, but upon the solid rock. This fact will render any deepening operation beyond the three feet of sand impracticable.

AT the meeting of the Wolverhampton Guardians on Friday, the members were engaged in committee for a considerable time in considering the plans for the new workhouse, which it is proposed to erect at Wednesfield. Mr. Marshall of Nottingham, the architect, was present. On the representatives of the press being admitted to the meeting, the Rev. G. W. Johnson moved that the report of the general purposes committee, recommending the adoption of the plans subject to certain alterations, be adopted. The rev. gentleman explained that the alterations related to a saving in the erection of the administrative block, and an increase in the efficiency of administration. He stated that Mr. Marshall had been in consultation with Mr. Gordon Smith at the Local Government Board Offices, and that gentleman, after going through the plans, had expressed his entire satisfaction with them, subject to one or two minor alterations which it was proposed to carry out. Mr. Sawyers seconded the motion, which was agreed to, and it was decided to employ Mr. Marshall to take out the quantities for the work in the erection of the workhouse at a fee of 1 per cent. on the outlay, such outlay.

A NOTTINGHAM bricklayer and builder, named William Tyson, claims kinship with James Tyson, the Australian millionaire, who died, it is supposed, intestate. The claimant is fifty-seven years of age, and was born in Lincolnshire, his mother Mary and grandmother Elizabeth being born in the same county. Mr. Tyson remembers well at the age of seventeen his great-uncle James leaving England for abroad. Years rolled by before his whereabouts was ascertained, and eventually a correspondence was entered into, accompanied with photographs. Acting on the advice of an Australian hotel-keeper who was visiting some friends in Nottingham a few months ago, Mr. Tyson sent further communications, which were, however, disregarded. According to a Nottingham tobacconist who while in Queensland made the acquaintance of the late millionaire, William Tyson is "the very image" of the deceased. Mr. Tyson is so confident that the deceased is his great-uncle that he has approached the Agent-General of New South Wales, and is consulting a lawyer in the matter.

MESSRS. TONKS, LIMITED, as befitting a house whose goods are so well known and universally esteemed, have been exceedingly busy the whole year, and have as usual well maintained their reputation for solid excellence in all branches—builder's, cabinet and general, naval and ecclesiastical brass-foundry—for in all they have an unrivalled selection of patterns (the result of more than a century's hard work) and catalogues innumerable. To meet the wants of numerous persons requiring sash-line for one window only, Messrs. Tonks are now offering short lengths of their widely popular lines—the steel ribbon in 20 feet and the metal-protected weatherproof (M.P.W.) in 18 feet lengths. Among their newer patterns is a sash-opener and automatic sash-fastener of great merit, a modification in a cheap form of their 9770. It lists at 9*s*, whilst of lock-plates and furniture, door-handles, &c., there is an endless variety. Of the merits of their Borola sash-fastener, Nicol's patent window fittings, improved helical hinges, metallic-woven stair-tread, solid drawn bolts, Vyvex hinges, &c., it is supererogatory to speak. Every one knows and acknowledges their value, and the patent bookshelf stripping and studs are the recognised desiderata for every library.



DOWSON, TAYLOR & CO., Ltd., Engineers,

FIRE AT THE WORKS OF THE ANAGLYPTA CO., DARWEN, LANCASHIRE.
The door we fitted in these works, although subjected to a heat intense enough to melt brass taps and fittings near it, withstood the heat perfectly, and can now be inspected at our works in Manchester, fit for duty. The metal sheets have expanded without becoming detached, whilst the wood is simply charred to a depth of about ⅛ of an inch.

FULL PARTICULARS AND ESTIMATES FREE.

VARIETIES.

THE annual meeting of the Royal Society of Antiquaries of Ireland will be held in Dublin on the 17th inst.

ROWNEY'S "Artists' Almanack" for 1899 has appeared. Although small in size, it contains much information about societies, exhibitions, &c., which will be found useful by artists.

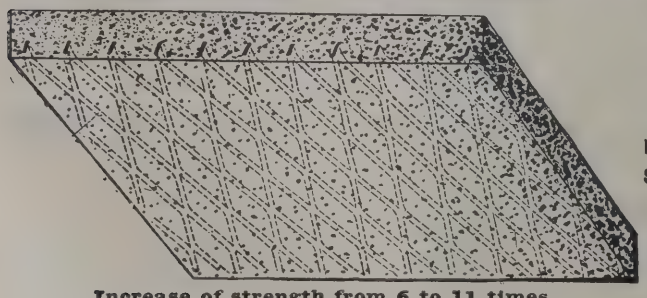
MESSRS. TRIST & CO., auctioneers, of 62 Old Broad Street, inform us that they have removed to temporary offices, No. 3 Great St. Helens, during the extensive structural alterations to their premises.

THE fourth ordinary meeting of the Liverpool Architectural Society will be held at the Free Public Library, William Brown Street, on Monday, the 9th inst., at 6 P.M., when a discussion will take place upon the following subjects:—1. The Architects' Registration Bill; 2. The Liverpool Electric Tramway System.

THE Town Council of Tamworth have purchased Tamworth Castle from Marquess Townshend for 3,000*l.*, and will lay out and throw open the grounds to the public. The castle descended to its late owner from the Marmions, through the De Freville and Ferrers families.

IN consequence of the retirement of Mr. Fothergill from the management of the London and Lancashire Fire Insurance Company, the directors have appointed the present sub-manager, Mr. F. W. P. Rutter, to be the manager and secretary as from 1st inst.

THE spacious Market Hall at Ashton-under-Lyne was the scene of a fire on the night of the 28th ult., and narrowly escaped destruction. The fire originated on a smallware stall on the west side of a building immediately beneath the tower, and considerable damage was done to that part of the building.



IN the Bill which the Leeds Corporation will promote in the ensuing session of Parliament they will seek powers to borrow 600,000*l.* for market extension, street improvement and other purposes.

THE new theatre at Kennington was successfully inaugurated on Boxing Night. It is to be known as the Prince of Wales's, and is advantageously situated in the main road and overlooking Kennington Park. It is built entirely of white stone with a wide portico, and free from the disfigurement of covering buildings, the theatre will do much to redeem the architectural credit of Kennington Road. The design, for which Mr. W. G. R. Sprague is responsible, is in the style of the Italian Renaissance. In the spacious crush-room and the grand staircases marble has been freely used. The decoration of the auditorium is in white and gold. The stage is very broad, its measurements being 80 feet by 50 feet. The electric-light installation is exceptionally complete, including ten arc lights of 2,500 candle-power each outside the building. The furnishing and subsidiary arrangements are very tasteful and complete. The builder is Mr. Walter Wallis.

DESIGNS for a winter garden or pavilion, proposed to be erected in the Duthie Park, Aberdeen, were recently submitted to the links and park committee of the Town Council by Mr. John Rust, city architect. The committee resolved to recommend the Council to proceed with the scheme. The cost is estimated at 1,550*l.* The winter garden will be placed in the centre of the grass plot between the railing and the main pleasure grounds on the north side of the park. According to the architect's designs the floor of the building will be raised above the ground 3 feet, and a terrace formed around the structure 10 feet wide, with a gravel walk on the top, and grass slopes. The building will measure 108 feet in length and 36 feet in width, with two side wings, each 30 feet long by 36 feet wide, with a circular dome in the centre 24 feet in diameter. The side walls will be 10 feet high from the floor, set on a dressed granite base, with sloping roofs resting on iron columns, and having a lantern roof along the centre 25 feet high from floor to apex—the dome being 46 feet high. There will be two main entrances—one from the north and one from the south end—with concrete passages 12 feet wide from end to end, with plots on either side 12 feet wide. A centre circular plot will also be formed under the dome, 20 feet in diameter, with a walk round it 10 feet wide. The two side wings will be divided from the centre building by means of a glass partition. The whole building will be of St. Petersburg redwood, all glazed with sheet glass, fitted with hot-water pipes and equipped with a heating-chamber under the north end. Arrangements will be made to allow of the different parts of the building being heated to different temperatures as desired.

AT the annual exhibition of the Hammersmith School of Art on the 31st ult., Sir William Richmond, R.A., K.C.B., said that he entertained great h pes of the study and practice of the decorative arts in England rising to even greater eminence than had been the case in the past. All, however, depended upon whether the general public wanted better work or not. Certainly there had been deterioration, but he believed that a reaction was now setting in, and this was probably because it

PRICE LIST AND ESTIMATES ON APPLICATION

was found absolutely necessary for English goods to be of the best possible quality. The tendency in recent years with regard to art seemed to have been too theoretical, but if art in its highest sense was to come back to England and shine as it once did, much more attention would have to be given to practical training. No doubt the general artistic taste of the people of this country was enormously improving, and we were now far in advance of France and Germany in this respect. Doubtless, however, it would be a long time before we reached the high ideal which many of them desired to see realised. Sir William concluded by urging those present to support the Vestry in the endeavour to establish a much larger art school and technical institute at Hammersmith.

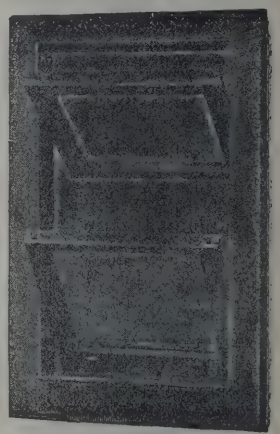
THE congregation of the Metropolitan Tabernacle assembled on Sunday at their old meeting place for the first time since its destruction by fire. The disaster took place on April 21, and in the meantime the congregation have worshipped in two sections, one at Spurgeon's Orphanage and the other at the Pastor's College. Only the basement floor has been so far made fit for use, at a cost of 7,866*l.*; nothing, however, has been spent except on the severely useful. The new hall holds nearly 2,000 persons, and was full on Sunday morning. It is too low for a gallery, and from the same cause is not well lighted from without. This occasions no inconvenience, however, as the hall is well illuminated by electricity.

THE new mansion of Mr. William C. Whitney, New York, the well-known millionaire, recently erected in Fifth Avenue, is said to be a dream of luxury. No other residence in America—few, indeed, in the world—rival it in point of magnificence. Mr. Whitney ransacked Europe, securing valuable bronzes, paintings, miniatures and ceramics, while eminent artists and sculptors were engaged in the interior decorations, the painted ceilings alone costing 10,000*l.* The gorgeous drawing-room will contain famous antique tapestries formerly hung in the Louvre, for which Mr. Whitney paid 200,000*l.* The magnificent furniture is of teak wood, beautifully carved. The paintings, bronzes and china are of equal splendour. A regal suite of rooms has been arranged for Mrs. Whitney, who is an invalid. The walls of the boudoir are hung with a silk fabric costing seven guineas a yard. The furniture, made in France, has cost 10,000*l.* The bathroom is built of the finest Carrara marble, relieved by onyx and other rare stones. The bath is cut from a single block, and the floor is composed of rare mosaics. The bath taps and other metal-work are made of pure gold of unique design.

ONE result of the recent outcry as to the inadequacy of Ludgate Hill station, on the London, Chatham and Dover Railway, has been, says the *Daily Telegraph*, the determination of the joint committee of the South-Eastern and Chatham Railways to cancel the stoppages of all main-line trains at this station, that is to say, on January 1 passengers intending to travel by these trains must go either to Holborn or St. Paul's. A few Crystal Palace and Blackheath trains will still call at Ludgate Hill, and only for a short time longer, and the next revision of the time-tables will probably show that no trains whatever will pull up at the main line platform between Holborn and St. Paul's, and *vice versâ*. Altogether, sixty-seven trains daily will be affected. The joint committee has been impelled to make this alteration in order that the platform accommodation of Ludgate Hill may be rearranged. The plans provide for the total abolition of the existing main-line "island" platform, which will no longer be required, and the relaying of the several "roads" will permit of the much-needed widening of the narrow suburban platform, which is now at certain times of the day so greatly congested. It will be made, approximately, double its present width, and substantial approaches and exits will be built. Possibly, too, some improvement may be made to the pitch of the roof. Passengers by the Metropolitan Extension, Great Northern, Midland, South-Western and South-Eastern trains—none of which run through St. Paul's, for they cross the Thames by the old and not the new bridge—will be the gainers by this improvement, which is to be effected at the cost of some thousands of pounds.

WE cull the following rather flowery description of an up-to-date "saloon bar" from the columns of an esteemed provincial contemporary:—"A visit to the new smoke-room will irresistibly call to mind the scenes of Oriental splendour of which we read in the Arabian Nights. Led blindfold into this apartment, the stranger might well be excused if he imagined that he had been transported into a Moorish palace replete with all the lavish decorations which tradition and history assign to the state-rooms of Eastern potentates. This new room—it seems commonplace to call it a smoking-room, but such is its intended purpose—is a veritable dream of cosy comfort, pleasing to the eye and restful to the body. Its decorations are rich, as distinct from gaudy—luxurious is perhaps the only fitting descriptive word. There is a seductiveness about the apartment quite in accordance with our views of the Oriental love of bright colours and sumptuous ease. The ceiling and walls are treated with an

elaborate adaptation in the Hispano-Moresque style, the walls being relieved by engaged columns carrying stalactited brackets, which in their turn support a deep cornice, enriched by the small pendant niches peculiar to this style. This room is divided from the bar proper by an open arcade of three arches carried on enriched columns."



THE Byfleet Village Hall and Club, which has been erected at a cost of 2,200*l.*, was formally opened a few days since by Lady Louisa Egerton. The exterior walls are of red-brick and rough-cast, and with the exception of the hall itself, which is slated, tiles have been used for the roof. Both externally and internally it is a copy of seventeenth-century domestic English architecture adapted to modern requirements, and with its prettily-timbered front, its twin turrets mounting guard over the verandahed double entrance, its quaint lead-lights of partially tinted glass in the hall, and its surmounting flèche and weather-vane, it arrests the attention of the passer-by and compels favourable comment. On either side of the entrance lobby is cloak-room and lavatory accommodation for ladies and gentlemen respectively, and immediately overhead are the caretaker's quarters. The hall, spacious and lofty, extends towards the rear, with green-room and ladies and gentlemen's dressing-rooms opening on to its permanent stage. Fronting the road, on the right-hand side of the building, is a reading-room, behind which is a larger room, in which the parish council will meet and other parochial business be transacted. This will be known as the parish room. Over these two rooms is a billiard-room which, with the reading-room downstairs, will constitute the special domain of the village club. The large hall will be available for public meetings, entertainments, and all parochial gatherings too large and important to be accommodated in the smaller parish room. The floor, which is specially suited for dancing and badminton, for which, on occasion, it will be used, is protected to that end by a stout canvas covering. The warming is done by hot-water pipes, and the artificial lighting by means of oil lamps. Elsewhere on the ground floor the floors are of wood blocks. Inside, as outside, the building is quaintly decorative in character, notable instances being the high fluted wainscotting of American whitewood stained green in the concert hall, and the old-fashioned fireplaces throughout the remainder of the building. Between the two front entrances is a tablet bearing the following inscription:—"This Hall was presented to the Village of Byfleet by Fredk. C. Stoop in commemoration of the completion of the sixtieth year of Queen Victoria's reign." Messrs. Ashley & Armstrong, 50 Berners Street, Oxford Street, W., are the architects, Mr. R. J. Hunt, of Chertsey, the builder. The cost of the furniture and fittings was some 300*l.* over and above the 2,200*l.* already mentioned.

LONDON IMPROVEMENTS IN 1898.

MOST people will allow, says a correspondent of the *Globe*, that the improvement of the year has been the pulling down of the houses in Parliament Street, giving a noble view of the Abbey and forming a worthy approach to the Houses of Parliament. It has been talked of for the last forty years, and the roadway will be made up in about another month. A smaller improvement, but one which will be welcomed by carriage people, has been made by pulling down houses at the Oxford Street end of Davies Street, so that instead of ending almost in a cul de sac, it now enters Oxford Street the same width that it leaves Berkeley Square. At the corner of Davies Street and Brook Street is the new Claridge's, a huge red-brick hotel just opened; while there will be a Davies Street station on the new Central Electric Railway, which reminds one that the City and Waterloo line has been opened for traffic, the second electric one in London. The ugly gap which existed for a number of years at the bottom of the Haymarket has been filled up with one of the most handsome buildings in the metropolis, the combined theatre of Mr. Tree and the Carlton Hotel, both of white stone elaborately carved and with cupolas and loggias.

For the fifth year in succession a building devoted to art has been added to London attractions. This time it is the South London Art Gallery at Camberwell, erected chiefly by a well-known philanthropist in memory of the late Lord Leighton. It opened with a loan exhibition, which drew visitors from all parts of the metropolis, and there is now on view an equally good "black and white" show. The attractions of the ever-popular Kew Gardens are increased by the quaint old Palace of George III., which Her Majesty has graciously thrown open to the public. Two new panels have been fixed in the Royal Exchange, making five out of the twenty-four required; while Sir William Richmond has finished the first of the four quarter domes at St. Paul's Cathedral. The Government has completed the third block of the Record Office on the site of the old Rolls House and Chapel in Chancery Lane. The windows where the old Chapel stood are of an ecclesiastical pattern, and it is said that part of the building will be

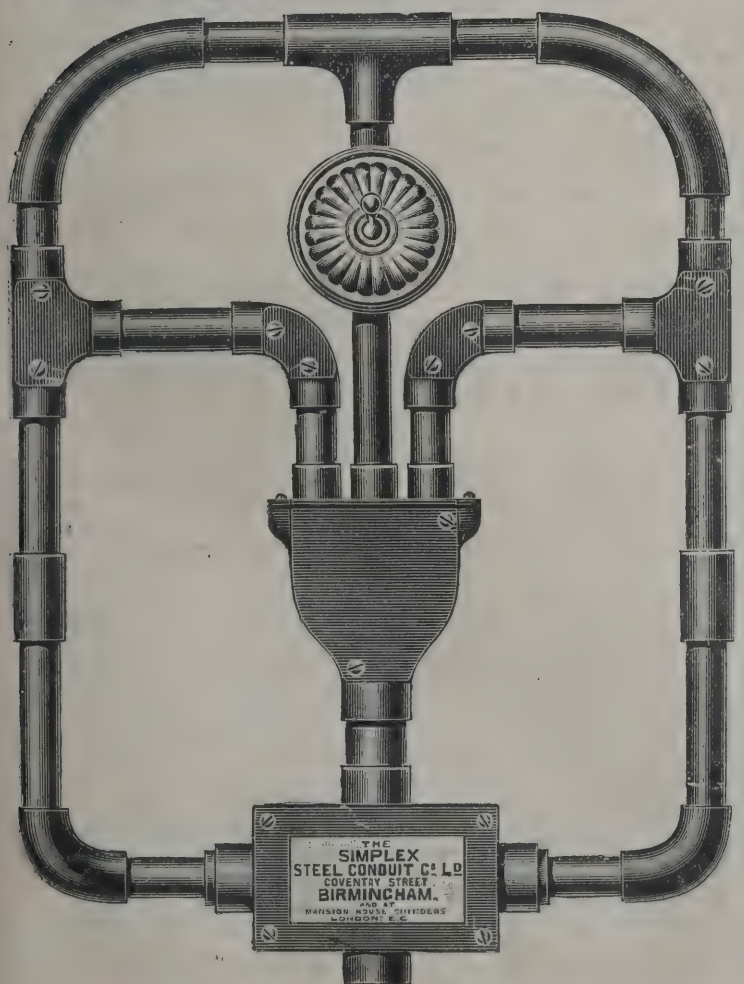
devoted to a collection of the principal treasures of the office, such as the Domesday Book and ancient charters. A large district post-office, faced with stone, has been built in Holborn. Other public buildings are the new offices of the health department of the Corporation in Basinghall Street. These are of the greystone peculiar to the Guildhall, and though the original design had to be modified in consequence of litigation as to "ancient lights," yet it harmonises with the rest of the irregular pile. It is not generally known that the back of the Guildhall in Basinghall Street is far more imposing and picturesque than the front part. A new police-court has been built at Highgate and a police-station at the corner of Gray's Inn, both of red brick. The large and handsome Institute of Mechanical Engineers at Storey's Gate has been completed, and a part of it is used as temporary Government offices. Near it, in Great George Street, is the new Institute of Chartered Accountants, and both these are of the now common red brick, with stone facings. Public baths of the usual type have been built at Deptford and Walworth, while Hoxton rejoices in a new Free Library, which it is hoped may tend to civilise the numerous disciples of "Bill Sikes" who flourish in that neighbourhood. Another Free Library has been given to the poor district of St. George's-in-the-East.

Education has been cared for by the opening of the Technical Institute and Central Library at Stratford, an unusually fine building, and by the West Ham School Board offices near it. The Polytechnic in the Borough Road has been largely extended, while a great hall has been added to the Battersea Institute. A smaller institute has been built for Southwark, near the Tower Bridge. The large Coborn Foundation School for Girls has been erected in the Bow Road and a training college for lay helpers in Stepney. Nearly a dozen large Board and Church schools have been built during the year.

Still more suburban theatres. The latest are the pretty Coronet at Notting Hill, the Princess of Wales's at Kennington, and the somewhat heavy-looking Crown Theatre at Peckham. Music halls, or theatres of variety, as their proprietors prefer to call them, have sprung up at Brixton, Hammersmith, Shoreditch and Spitalfields, most of them with façades that would not disgrace a first-class street.

Notable examples of street architecture are the large hotel next the Empire in Leicester Square, the huge Babel-like edifice on the site of the old Hanover Chapel in Regent Street, capped by a large dome, and the front decorated with mosaic, as becomes the headquarters of Salviati, of Venice. In Oxford Street are the Tudor Hotel in red stone, and the large white stone premises, surmounted by a dome, of Messrs. Lewis. Messrs. Grindlay's new premises in Parliament Street are original, the base being of black granite, which contrasts well with the white stone above.

This has been a year of large additions to our open spaces. The Queen's Wood at Highgate, over 70 acres of the wildest woodland, has been rescued from the builder. So has Golder's Hill, the beautifully-wooded seat of the late Sir Spencer Wells, rescued by patriotic dwellers at Hampstead, adding nearly 40 acres to their famous Heath. A generous landlord has given a wooded hill overlooking the Lea Valley to be added to Epping Forest; and Mr. Horniman has set apart his extensive and beautiful grounds at Forest Hill for the use of the public. Deptford Park, a fine open space, has just been secured for that densely-crowded locality. A number of smaller spaces, such as disused churchyards, &c, have been laid out by the excellent Metropolitan Gardens Association and parochial authorities. Taking all together it will be seen that a considerable number of additions and improvements have been made in 1898.



THE REGISTRATION OF PLUMBERS.

THE Registration Committee were entertained by the master, wardens and court of the Plumbers' Company to dinner on Thursday last week. Amongst those present were:—Dr. Allan, medical officer of health to the Strand Board of Works; Dr. Priestley, medical officer of health to the Lambeth Vestry; Mr. T. de Courcy Meade, city surveyor, Manchester; Dr. Mansel-Howe, and representatives of the London Society of Associated Master Plumbers, and the various London Lodges of the United Operative Plumbers' Association of Great Britain and Ireland.

Mr. de Courcy Meade, in proposing the toast of "The Registration Committee," said there was no doubt that the work of the Registration Committee in connection with the National Registration of Plumbers was being more and more felt throughout the Kingdom, and he particularly referred to this being the case in Lancashire, where in his capacity as city surveyor of Manchester it came repeatedly and forcibly under his notice.

Mr. J. W. Clarke spoke of the progress made in connection with the movement, reviewing it from its early stages, and

THE SIMPLEX STEEL CONDUIT SYSTEM.

referring to its commencement as the outcome of the International Health Exhibition held in 1884.

Mr. F. Randall, speaking on behalf of the operative plumbers, referred to their desire to secure the highest standard of plumbers' work, and their appreciation of the support rendered generally to the registration movement, particularly by prominent medical and architectural authorities. He expressed the hope that a scheme of apprenticeship for plumbers in London would be established as quickly as possible, and that the classes for plumbers should be open only to bona-fide apprentices. By these means he ventures to say that not only the plumbing trade but the public would be greatly benefited and safeguarded from the evils of bad plumbing work in future. With a satisfactory scheme of apprenticeship and registration at the termination of such apprenticeship, all desired ends would, he considered, be attained.

Mr. Thomerson, on behalf of the master plumbers, stated that the Associations were fully in sympathy with the registration of plumbers, inasmuch as the chief qualification required for a master plumber to be admitted into the Association of Master Plumbers was the possession of a certificate of registration. He fully endorsed Mr. Randall's words as to the desirability and necessity for a scheme of apprenticeship, and hoped that such a scheme would shortly be formulated to the satisfaction of the master plumbers and the operative plumbers.

Dr. Priestley expressed his belief that the support of the operative plumbers was necessary to the success of the registration movement, and urged the operative plumbers to band themselves together to push forward the movement in the interests, not only of themselves, but of the public health.

FROST AND BUILDING MATERIALS.

THE scientific studies of the American architects and engineers find a subject for exercise in considering the effect of frost on various building materials. According to the *American Architect*, some interesting experiments have been made by Mr. A. C. Hobart, Fellow in Civil Engineering of the University of Illinois, on the effect of freezing on cement-mortar. The phenomena incident to the freezing of freshly-mixed cement-mortar have already been investigated with tolerable thoroughness, and Mr. Hobart therefore devoted himself mainly to the study of such mortars, frozen only after setting had begun. In order to secure uniform conditions, he obtained the use of a room in a cold-storage warehouse, where a constant temperature was maintained of about 20 deg. Fahr., and the briquettes of cement, of various kinds, were removed to this room after a definite period had been allowed for setting in the rooms of the Engineering Laboratory. The cements experimented with were all of sorts not much used in the East, the natural brands being Clark's Utica, Louisville Black Diamond, Louisville Star, and Akron; while only two Portland cements were used, Saylor's and Dufossez's. With all these, freezing immediately after moulding caused loss of strength, and where frozen in contact with water, total disintegration; but where the briquettes were allowed to set before freezing the result was very different. In the case of the natural cements, where the briquettes were allowed to set for six hours, or in some cases less, and then frozen, it was found that the strength, instead of being diminished, was greatly increased, such briquettes, after careful thawing, resisting a greater tension than similar briquettes of the same age which had not been frozen. Mortars made with two parts sand to one of cement were more favourably affected than the one to one or the neat mortars, the Louisville black diamond briquettes, mixed two of sand to one of cement, allowed to set for two or three hours only, showing after freezing and subsequent thawing a resistance about three times as great as that of similar briquettes made at the same time and tested at the same time, but not frozen meanwhile. It is curious that the same mortar, if allowed to set for several days before freezing, gained much less by the process, but even after fourteen days' setting freezing added something to the strength. With Portland cements there was no gain by freezing in any case, and generally a considerable loss, but the loss in strength was less when frozen after twenty-four hours' setting than after six hours, and mortars made with a considerable portion of sand lost, proportionately, much less than neat cement. The conclusions which Mr Hobart draws from the experiments are, that cement mortars, made either with natural or Portland cement, if frozen in the presence of water, are likely to be disintegrated and destroyed; but that, if extraneous moisture is kept away from them, natural cement mortars, if allowed to set from three to six hours, are improved by subsequent freezing; while mortars of Portland cement under such circumstances lose strength, particularly when mixed with a large excess of sand. Moreover, while mortars of natural cement usually suffer a slight surface disintegration by freezing, although the total resistance of the briquette is

greatly increased, briquettes of Portland cement mortar show no change on the surface, although their strength may be almost entirely destroyed.

Mr. F. Baumann has given the results of his experience in the *Inland Architect*:—

Natural cements, he says, should never be used in freezing weather. The cement once frozen has lost all of its binding property. Thawed out it crumbles like mere sand. Portland cement, however, behaves very much better, and it is contended that some brands are especially fit for use in frosty weather. No proper explanation can as yet be offered as to this particular difference in quality.

Common mortar, however, should be considered as being subject to no detrimental change in its properties through the action of frost. On the contrary, it is improved. This is especially evident in all cases in which the mortar steadily continues—for a time of three to four months—to remain in a frozen state, so as to allow all surplus moisture to vapourise. Plastering thus "frozen dry" turns out to be the toughest and in every respect best kind of such work. Where roofing-tile are jointed with mortar the best work is ever obtained in steadily frosty weather, lasting long enough to allow the mortar to set. But the difficulty in our climate is that such steady frost-weather can never be depended upon. We are bound to resort to artificial heat in processes of plastering, to say nothing of the advantage in saving time. A peculiar property of frozen mortar is, that when a sudden thaw sets in shortly after freezing, this mortar will become quite liquid. It will drop from the plastering lath, will also freely ooze out from the joints in a stone wall.

Stone walls should never be built in frosty weather, or at a time when frost may set in shortly thereafter. If the stones are laid in common cement mortar, they would be no better off than if laid in dry sand, if as well. If laid in lime mortar the case is even worse, because the mortar in heavy joints, where none or very little of its moisture is absorbed by the stone, becomes so liquid when thawing that it will freely ooze out from the joints, and thus leave the masonry more or less unstable. In case stone walls are imperatively called for they should, therefore, not be built with lime, or common cement mortar. A proper kind of Portland cement is required. Considering this as to expense, and as to the possibility that the kind of cement chosen is not the proper one, it would appear to be like a positive rule for every practitioner to avoid in frosty weather the use of common stone on any kind of walls. Foundations may be of dimension stone bedded in sand merely; basement walls of brick laid in lime mortar. In case exterior faces of these walls are to be shielded against dampness, it would be utterly useless to apply the usual cement mortar coating, the full efficiency of which is doubtful in any case.

When, soon after the great Chicago fire of 1871, the rebuilding of the city began, basement walls were in a number of cases built with rubble stone. Frost soon thereafter setting in and remaining almost constant till March in the year following, their green mortar was in solid condition enough to sustain the superstructure in the meantime thereon erected. But so soon as the March weather set in they were speedily converted into a loose mass of rubble, held in a precarious position by a loose mass of mortar, which began to ooze out and endanger the stability of the structure. A remedy was found in the speedy call of the "house doctor" and his jackscrews. Yet so ignorant were both architect and builder as to the threatening cause, that the "doctor" was discharged after the rectification of a south wall, to be called again within a week thereafter in order to also uphold the north wall, which had followed the example of the south wall.

An "accident" took place on another street, where a block of three stores, four storeys high, fell all on a sudden into a heap of ruins. Its basement walls, some 6 feet high from the ground, had been built of stone. "Jack Frost" had solidified them for the time being. The walls were completed and roof put on. When "Jack" took his leave the structure was doomed. Lucky it was that the crash took place early in the morning prior to starting work.

The lesson then so repeatedly given had, however, not sufficed to afford the necessary amount of instruction. A prominent member of the profession undertook, two years thereafter, to build in winter a stone cellar wall of a store, with no favourable result. Had the tottering wall been an isolated one instead of one leaning against the wall of an adjoining store, it would probably have come to the ground.

Contrary to general opinion on the part of the public, it must be stated as a fact that masonry is improved in its quality by the action of frost, provided it has received the amount and degree of care required. It is in disrepute because the conditions on which success depend have so seldom been altogether well observed, even if they were at all understood. When mortar freezes, when the ultimate parts of its humidity expand into solid crystals, the rubbing motion of particle

against particle then taking place is without question a very severe one, enough so to exact an improved condition of them, especially in regard to the silica which thereby seems to become in a measure "unlocked." It is converted, partly so, from its original inert state into one of more or less acute affinity, by which the silicatisation of the lime is started, and increased in rapidity of its action. My own conviction in regard to the fact that masonry properly executed in frosty weather is comparatively the best is positive. It is shared by good and attentive masons as well as a number of architects. All that is required in the case is that the subject be more fully investigated and results taken *ad notam*. A time-honoured prejudice will then be fully dispelled.

The necessity of "keeping the weather out" from inhabited buildings is self-evident, and protective measures, especially as to exposed parts, such as fire-walls and chimney-tops, owing to the introduction of Portland cement and terra-cotta lap-coping, have at last become a rule. Facts have gradually had the effect of demonstrating a necessity, from which no part of a building is excepted. A most special care is owing to monumental structures which, as the case is, are designated to endure for ages. Frost is their principal enemy. Water enters into the minutest open joint and ever expands it by freezing. It is to be kept in mind that this expansion taking place is ever and ever repeated with irresistible force. It is exceedingly difficult, if at all possible, to construct monumental work, self-evidently to be durable, with small pieces of material, the joints between them offering so many chances for gradual destruction.

A cemetery vault was, some eight years ago, constructed at Graceland Cemetery, Chicago, with arches composed of small blocks of granite. The structure was altogether neat and attractive, affording evidence of a good deal of happy thought on the part of the architect. But the grim existence of "Jack Frost" had not entered upon his mind. The result was that improved arches were made in the spring following.

In the earlier days of our commonwealth, attention to the destructive agency of frost seems to have been rarely paid. Many a cemetery vault then built on the side of a hill, the arch covered with soil and sod, has gone out of existence owing to the destructive agency of frost. Some of them have been rebuilt in place of being abandoned. All of them, I trust, could be made permanent by not only covering the arch with a coating of Portland cement concrete, but also protecting this coating with sheet lead of fair thickness, the sheets soldered.

The fewer the joints, the larger the constructive units, the more certain the durability of the structure. All joints should be carefully prepared for filling with lead, to be firmly caulked. Such caulking requires that the blocks be massive, in order that they may resist all lateral motion thereby induced. This necessity should be considered a factor in the style of all monumental work.

The superficial inspection of the New York Brooklyn suspension bridge reveals a want of care as to the results of the action of frost, and even Government work is, here and there, allowed to be thus injured. I have noticed heavy granite copings on quite new retaining walls somewhat moved off their beds. The retaining walls to the approaches of our river tunnels have been rebuilt twice and are again leaning, owing to an ever-repeated freezing of the ground which leans against their back. On our principal residence streets are shown a large number of fence copings in a "demoralised" condition, brought on by the action of frost. The time for proper care and attention in regard to the relentless action of frost seems, after all, to be as yet in suspense.

SPECIFICATIONS IN CANADA.

MUCH has been said and experienced, says Mr. D. A. Hewitt in the *Canadian Architect*, on the length of time it requires to draw a thorough and comprehensive description of the several things that go to make a complete specification. The drudgery could be lightened somewhat and delegated to a junior clerk who writes a good hand or can operate a typewriter, by a system of cataloguing or cypher code alluding to the architect's private collection of choice architectural phrases.

In taking instructions from a client it is well to have a sheet on which to note the various and minor requirements which really enter into and form a very important part of the specification. By a judicious arrangement of the "Wants," this list may form a part of the specification skeleton, from which a concise and well-arranged description is obtained for drawing the final specification. From the numerous pamphlets and books published on this subject, a good many clauses suited to the particular phraseology of the architect can be had, and from which he may make his book. The numerous clippings are most conveniently sorted into an "invoice" book, the pages of which are numbered, and an index of contents in the back aids as a rapid search.

Each paragraph usually refers to but one item of the work,

Size No. 8. Diameter ¼-in.
Will outwear a hollow-braided line twice its diameter.

IN EVEN THE BEST houses common rough hollow-braided sash line is almost universally used. The Architect does not trouble to specify. The Builder buys the "usual thing." The result is annoyance and expense of breaking cords and falling windows. **Try the SAMSON SOLID BRAIDED SASH LINE.** Tenfold the durability and smooth running. **Practically same price.**
Of all First-class Dealers everywhere.

VOLUME LIX. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered.
Price 12*s.* 6*d.*
Office: 175 Strand, London, W.C.

KETTON FREESTONE.

The Price List issued by us as Agents for Major Braithwaite is objected to by Lady Northwick, the Lady of the Manor of Ketton, and the owner of the Ketton Quarries, and her Trustees, and by their Lessee, Mr. Molesworth, on account of the stone which we offer for sale on behalf of Major Braithwaite being described as Ketton Freestone, and the Quarries from which it is obtained as being situate at Ketton.

The fact is that Major Braithwaite's recently opened Quarries, though close to the Parish of Ketton, are not in that Parish but in the Parish of Edithweston. We regret the inaccuracy, and withdraw the Price List, for which another is now substituted in an amended form. The stone from Major Braithwaite's Quarries will in future be called "Edithweston Freestone."

WOODFORDE & WING,
St. Peter's Street, Stamford.
December, 1898.

as "Strapping," "Casing," "Hardware," Lathing," "First Coat of Plaster," or other things, according to the special department of work. The intention is to number the different paragraphs in each trade, as—25, "Strapping," 58, "Casings," and so on consecutively. A "skeleton list" of the aforesaid specification, giving the number and name of each paragraph, would assist the memory of the specification writer and be a check on the items that it should contain. When the architect is desirous of getting up a specification for a new piece of work, he takes from his model specification a list of numbers (without names), and where special or altered clauses eventuate, he drafts them on separate slips of paper and makes a note of it on the list of numbers. The routine or stereotype of the matter can thus be obtained for the stenographer by the use of a string of numbers; the intention is not to use the skeleton numbers in the finished document.

Interlining of old specifications has its advantages, but so seldom is it that two jobs are similar that it entails considerable drafting of slips to apply in this case. The suggestion of model clauses or slips is better.

Another feature is noted in specification writing, that which might be called the "construction method." As the several items come on the works and are used, in the same order should they appear in the written document, and thereby save many omissions or the makeshift of an addenda.

In the carpenters' work four subdivisions might be made and classified as "rough work," "exterior work," "interior work" and "trimmings, with hardware." Some architects draw a carpenter's specification as a whole, without making any different headings or marginal references. This involves time and patience in hunting out any one item, unless the person looking for it is familiar with the make-up. Mechanics having to refer for guidance experience difficulty in locating the desired information from the vague way the clauses are designated and the length of paragraphs, covering several items.

On completion of the whole specification a frontal index page should give the contents of the several pages, thus :—

Page 1—Excavate, grade, &c.

Page 2—Drains, weepers, filling.

For single items of reference, the alphabetical index of contents to the printed forms is easy of access, but does not always assist the architect so well as a list prepared on the construction method.

Each trade should have a slight reference clause drawing attention to one general set of conditions and time schedule, giving date of completion for each contractor, preceding the main specification. Thus, such features of the "Builders' Revised Contract" as do not coincide with the wishes of the writer can be straightened out as he may desire.

Frequent changes could be made from time to time in a model specification or system similar to the manner in which a filing cabinet can be used. The arrangement should consist of cards of tag board, 3 inches high by the width of foolscap, on which each paragraph is pasted. The numbers must assist in maintaining order. When it is found absolutely necessary to elongate a clause, or introduce a new one, and space is not to be had on a card, let such additional card bear the number of the paragraph or insertion, and be distinguished by letters, as No. 76A or No. 76B

In "setting up" for a specification one would only require to pick out the clauses and add such changes by written slips to convey to the stenographer the matter. Letter files or a desk drawer will easily contain this system, and be kept in order by the office boy after each piece of work has been written.

NATIONAL PROVINCIAL BANK, RAMSGATE.

A NOTABLE addition to the public buildings of Ramsgate was opened for business on the 21st ult. in the newly-erected premises of the National Provincial Bank, the designs for which were prepared by Mr. W. W. Gwyther, of Temple Chambers, E.C., and carried out under his supervision by Messrs. W. W. Martin & Sons. Fitness for the purpose for which the building is designed is everywhere apparent, and at the same time beauty of detail and fitting has been secured. The banking-room is a spacious hall of horseshoe shape. The walls are of duck-egg green, the columns and pilasters of cinnamon brown, the capitals slightly picked out in the same shade of green. At the back of the hall is a glazed dome whence the clerks' desks will derive light. At night a sun burner will be utilised. The public space is covered with a floor of Venetian mosaic work; that of the manager's room is of wainscot oak and parquetry. Messrs. De Grelle, Houdrét & Co., of 130 London Wall, supplied the mosaic and terrazzo work. The grille is of wrought-iron by Messrs. Allen & Co., of Queen Victoria Street, City. The ceiling is in harmony with the remainder of the

84 Brook Street, Grosvenor Square, W.; December 8, 1893.

Sir WILLIAM BROADBENT encloses cheque for the "Grundy" Heating Apparatus supplied to his house, and is glad to say that it has proved very satisfactory for warming and ventilating as required. The principle of the apparatus is most excellent.—To Mr. Grundy.

October 24, 1893: Hind Head House, Haslemere.

PROFESSOR TYNDALL writes:—

Dear Sir,—My house being so well provided with grates and flues for the generation and distribution of pure warm air, I have thus been enabled to spend my winters in England instead of on a foreign shore.—Yours very truly,

JOHN TYNDALL.

Buckhurst Manor, Wadhurst.

Dr. GRIEVES says:—

I have insisted upon my architect adopting the "GRUNDY" system of pure warm air for Heating and Ventilating Buckhurst Manor. I should not like my house warmed with any other method, for I like plenty of ventilation, and do not approve of stagnant air.

Fever Hospital and House of Recovery, Cork Street, Dublin: October 26, 1894.

Dear Sir,—I have much pleasure in informing you that we have found your HEATING APPARATUS a great success in our new Epidemic Hospital, which consists of a two-storey building, each storey containing two large wards, a smaller isolation ward, and two nurses' rooms. It is easily managed, does not cost much for fuel, and the air entering is most pleasant, warm and free from smell. It is with the full concurrence of the Managing Committee I give you this testimonial.—Yours faithfully,

JOHN MARSHALL DAY, Registrar and Resident Medical Officer.

decoration. The Milner's Safe Company, Limited, of 28 Finsbury Pavement, London, E.C., furnished the strong-room doors. The lifts are by Messrs. Clark, Bunnett & Co., New Cross Road. The heating arrangements are excellent. In the heating-chamber is a compact boiler, which supplies the premises with warmth through hot-water pipes. The apparatus for this was put in by Messrs. Berry, Campbell & Co., of 62 Watling Street, London, E.C. (who also supplied the radiators). The "Silens" fanlight openers are by Messrs. Leggott & Co., and the sanitary fittings by Messrs. Jennings & Co.

SANITARY PAINTING.*

A TRULY ancient and honourable handicraft is that of the painter; one of the few that have come down to us from the remotest antiquity practically untouched by that all-devouring ogre which has destroyed so much handicraft—I mean machine production.

In painting you still get the personal equation which no machinery can ever substitute. In all art work it is the personal equation that confers the merit upon the work. This is, of course, well recognised when fine art work (as it is called) is under consideration. But house-painting is so familiar that it incurs the contempt of those who, from lack of training, are unable to appreciate either its æsthetic value or the degree of personal skill displayed.

And yet, to the really observant, how interesting is a bit of properly executed painters' work. To appreciate the æsthetic value of the different textures of the surfaces, as finished by the skilful painter, and to realise the manipulative skill and feeling for effect that went to produce them, is an education in itself. Then the genuine practical knowledge of colour required to be brought to bear in the harmonious tinting of structural work can only be fully appreciated by those who have tried. In fact, to the house-painter as much as to the fine-art man, is it necessary to bear in mind that his paints must be mixed with brains. And then, what scope there is for the exercise of skill and knowledge in the mere mixing and alternating of the coatings of paint in order to obtain from it the greatest protective power. From the merely protective point of view, unskilful painting may mean monetary loss through rot and weather influences which the paint has failed to keep out, while skilfully painted work always means money saved.

I think, therefore, a few words designed to disseminate a truer conception of the sanitary, æsthetic and protective value of good painters' work may not be without interest in an important city like Liverpool.

In his way the sanitary painter is even more important than the sanitary plumber. The plumber's sanitary appliances are located in a few well defined places in a building, and the application of his skill is limited accordingly, whereas the painter's sanitary work extends from cellar to garret, and almost embraces every yard of the interior surface of a building.

When it is realised that one-third of our lives is passed in our bedrooms alone, and probably half or more indoors, how important does it become to have our dwellings sanitary in the highest degree; and for this sanitation the public must depend mainly upon the painter. He it is who must remove all old colourings and old papers, which are necessarily tainted with the effete exhalations of the occupants, and these are known to be poisonous; fill up all crevices, which harbour disease germs; rub down old paint to smoothness, and fill up its dents and cracks so that it shall not easily catch and retain unsanitary germs—in fact, do all those things which in specifications are commonly classed under the word "prepare." Now, as the preparing of work is not to the untutored eye self-evident in the finished result, this part of the work is frequently omitted or scamped, and, indeed, this omission or scamping always takes place in low-priced work; and this fact principally accounts for the extraordinary variations of price in painters' work

If the public only realised what whited sepulchres they go into in the shape of rented dwellings, offices, shops and the like, in which this elementary sanitary work has been grossly neglected, they would insist upon every master house-painter being registered or licensed like any doctor, lawyer, or other professional man, whose work is of such general public importance as to require a public certificate of competency to entitle him to practise.

To many this may seem far-fetched, but to those who keep abreast of the science of the day and appreciate the bearing of the results of modern bacteriology, I feel sure these remarks will appeal with full force.

In the public interest I cannot too strongly emphasise this point; it is one which touches the public health very closely, and in its own interest the public should demand from those who practise the art of domestic painting the most conscientious performance of their sanitary work.

In this connection let me say that the modern system of competitive tendering for sanitary work of any kind is simply a premium on scamping. It is no uncommon thing for painting tenders to vary 100 per cent. for what purports to be identical work, and the public generally, failing to recognise any other measure of value than that of price, accepts the lowest tender. But can anyone, knowing human nature, reasonably expect the conscientious performance of work under such conditions?

There are no worse offenders against common sense in this respect than committees and public bodies. They allow the idea that as custodians of the money of their constituents they are bound to exercise the most rigid economy to dominate every consideration, and altogether overlook the fact that scamped work of this class is really, when broadly and fully considered, the least economical for the public, whose interests they are trying to serve.

It seems to me that if those who obtain competitive tenders made it a rule to accept the tender nearest in price to an average of all the tenders received, much better results would accrue and a truer economy be observed.

Not less important in its bearing upon the comfort and happiness of the public is the house-painters' work from the æsthetic side.

The important effect of environment upon animals generally, and upon man in particular, is well recognised by scientists like Darwin, Wallace, and others; and although their works deal mostly with the effects of climatic and geographical environment, the principles they have laid down are well recognised as applying to social and æsthetic environment.

Each one from his own experience knows that some kinds of colouring confer pleasure, while others leave him unaffected, or even go so far as to give pain and produce physical and mental discomfort.

Now, quality in colour is one of those things that cannot be described in a specification. It can only be felt by those who have the colour sense, and interpreted by those who have in addition technical skill. It is not a thing you can schedule at so much a yard. It can only be obtained from certain individuals who have been endowed by nature, and who must have a free hand to produce their best effects.

Far-reaching and subtle are the influences of æsthetic colour in the domestic and business environment of our daily life. From the home where the tiny impressionable children spend so many hours, and where good and bad æsthetic impressions become indelibly fixed on young and sensitive organisations, through school and business life, from the cottage to the palace, in all our surroundings we are soothed, stimulated, calmed and invigorated, or the reverse of all these things, according to the kind of colour impressions we surround ourselves with. Is not the benefit derived from going to the country, or the seaside, or from foreign travel, as much due to the colour impressions we receive as the fresh air we breathe, or the change of climate?

In short, so subtle and yet so persistent in its effect upon the human organism is the quality of colour, that it is a surprising thing to those who, like house-painters, make the study of colour the business of their lives, to find so little real appreciation of its value among the general public. And yet, rightly appreciated, the consideration of these things forces us to the conclusion that the colour work of the house-painter is only a wider form of his other sanitary work, affecting as it does so intimately the health of his clients. In a word, the house-painter is really a kind of colour doctor, who ought to be able to prescribe intelligently in terms of colour, and to whom the public should turn for colour advice, instead of being, as at present, much given to inconsiderately swallowing any quackery in the way of colour which may happen to be the rage of the moment.

To see the devotion and determination of the victims, one would think that their eternal salvation in a colour sense depended upon their living in an environment of ivory-white and a Morris paper, as though, like a certain notorious medicine, these were a "safe cure" for all the colour ills that flesh is heir to.

There is one side of painting that I think the public do really appreciate the value of to some extent, viz. its protective value. In fact, they go to the extreme frequently, and think that in a multitude of coats of paint there is safety. At all events, many specifications, especially those emanating from architects' offices, are largely over-specified, to the great delight of the cut-price tenderer, who sees his opportunity to hoodwink the architect and the public by posing as the cheapest of the cheap, when he is only the most unscrupulous of his tribe, and never intends to carry out the requirements of the specification.

In the matter of the protective value of paint there is as much danger in too many and too thick coats of paint as in

* An address delivered at the convention of the Master House-Painters of England and Wales by Mr. A. G. White, president.

too few and too thin. Nor is it merely upon the number of coats of paint that the protection depends. The nature of the texture of the surface, its chemical qualities; the nature of its environment, whether exposed to excessive heat or cold, or wet, or wind and sand, or chemical fumes—all these things have to be considered when the protective value of painting is in question.

The time of the year when the painting is done modifies the practice profoundly, and the materials which in summer give excellent results, in winter would fail entirely.

These considerations bring us back to the point we started from—viz. preparation of painters' work—for if preparation is essential from the sanitary point of view, it is doubly so from the point of view of durability: the time spent on the preparation of old work before any paint is applied, and the subsequent between-coat preparation, is of the highest possible value as bearing in the most direct manner upon the ultimate durability and therefore protecting power of the paint.

Here let me say that the public seem to fail entirely to appreciate the value of drying time as affecting the appearance and durability of painters' work. Nowadays a painter is almost afraid to ask a reasonable time for the execution of his work. The client is so accustomed to seeing business work carried on around him in the shortest possible time, that he expects the same thing from the painter, and often gets it, but to his own detriment. The public ought to realise that the processes of painting are practically the same to-day as they were in the remote past; that machinery and labour organised to work to high pressure cannot effect in the painter's work what it can in other trades, because painting is a handicraft, and because time is an absolute necessity between the processes if the work is to give satisfaction.

Scamped preparation means frequent repaintings and frequent expense.

The life and health of a building, therefore, depend upon its intelligent protection by paint.

So that whether you consider the house-painter from the point of view of the preparation of the interior of a dwelling, or from the colour treatment of the dwelling, or from that of the protection of the exterior of the dwelling, he is, and ought to be, in all his work a sanitary expert in the highest and broadest sense of the word, and enjoy a high degree of consideration from the public accordingly.

I have endeavoured thus briefly, and avoiding technicalities, to put into popular form some of the broad facts that underlie the practice of the painter's art, in the hope that the public may more adequately appreciate how important it is that a class of work bearing so directly upon the public health and happiness, both physical and mental, should be entrusted to really competent exponents of the painter's art, and that it may realise the good old English maxim, that the "best is the cheapest," applies in the highest sense of the word to the art of domestic painting.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C. from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

26755. Joseph Lowe and George Eldred Shawyer, for "Improvements in roofing construction."

27173. Jonathan Rowe, for "Improvements in or relating to the manufacture of bricks."

Specifications Published.

24423. Lake (Piron), for "Apparatus for heating buildings and the like."

30798. Dellagana & Hand, for "Pavements, floors, stairs and the like"

3113. Liddle (Omohundro), for "Machines for making bricks, tiles and the like."

5244 Pullan & Mann, for "Machines for making firebricks, glazed bricks and the like."

6452. Weyler, for "Bricks, tiles, slabs or blocks for use in the construction of floors, roofs, vaults and the like."

21860. Vanhauten, Plumen & Noppeney, for "Fireproof floors, ceilings or similar surfaces."

The Architect.

THE WEEK.

IT is satisfactory to know that throughout England there are gentlemen in authority who are zealous to secure the safety of the people who attend performances in theatres, music-halls and other places of amusement. There would, however, be an advantage if they did not form rival bodies, and if a builder or lessee after having satisfied one of them discovered that he was not to go through the ordeal *de novo* with the rest. In the hurry of arrangements for opening, a perplexed lessee is likely to forget some of the authorities who have to be assured that he has not laid a trap for the public, and in that case the value of his property runs the chance of being diminished, for the majority of seekers of amusement cannot believe that a mere formality is sufficient to call for the interference of a magistrate. A case of the kind has just occurred in Nottingham. An ex-lessee of a "palace of varieties" was summoned because alterations were made without the approval of the licensing justices. The defendant was no longer associated with the building, but as his name was on the license he was considered to be still responsible. It was admitted that the offence was not wilful, and that the case was brought before the Bench not so much for the penalty, which was 20*l.*, as to make clear to owners, architects, builders and others who had anything to do with alterations of such premises that their responsibilities were serious, and that they ran risks if they did not adhere entirely to the conditions. It was not disputed, however, that the plans were submitted to the Works and Ways Committee of the Nottingham Corporation as well as to the Watch Committee, that the premises were inspected by an official, who offered suggestions which were duly carried out. What made the case more extraordinary was that the magistrates were members of the committee, and were therefore in one capacity called upon to condemn the work of which they approved in another capacity. A pantomime could not have a more strange incident. It would be ridiculous to have imposed a fine in such a case, and accordingly it was dismissed on the payment of costs. But the hope was expressed that the case would serve as a warning to owners, architects, builders, &c. We have nothing to do with questions of municipal and magisterial etiquette, and if the law allows quarrels over straws every one engaged must accept the consequences. But we should like to know what assistance is possessed by the ordinary bench of magistrates to enable a judgment to be formed about the security of a complex building like a theatre. A municipal committee can have the services of the borough surveyor at command, but a county surveyor would be amazed if he were called from one end of a county to give advice in such a case as that related.

ALL visitors to Edinburgh have pointed out to them the house which is supposed to have served as a residence for JOHN KNOX. It is in the Netherbow. Sir DANIEL WILSON says it was secured for him, and the rent paid by the city treasurer was "eight merks." There, we are told, he entered on his duties as minister of St. Giles's, there he lost "the brave and faithful wife who had shared his earlier privations and sufferings," there he brought his second wife, and there hospitably entertained his friends. When the High Street became the battle-field of queen's men and king's men KNOX had to abandon his manse, but on his return to Edinburgh, says WILSON, "in the absence of other evidence we may welcome such guidance as tradition supplies, and still think of the house that has so long borne his name as the lodging where his last days were spent." From a paper which was read by Mr. ROBERT MILLAR, the late Lord Dean of Guild, before the Society of Antiquaries of Scotland on Monday, the belief which connected JOHN MOSMAN'S house in the Netherbow with the Reformer can only be traced back to a popular guide-book called "STARK'S Picture of Edinburgh," published in 1806. It appears, moreover, there was another JOHN KNOX who possessed property near the Netherbow, whose name was used to mark off the boundaries of properties from 1561 to 1681. Probably STARK was thus led to the identification of the house now called JOHN KNOX'S, on the supposition that there could have been no JOHN KNOX but the Reformer. Mr. MILLAR has made an exhaustive investigation of the Council records, the Dean of Guild's accounts and the protocol books of the city of Edinburgh, in order to ascertain where JOHN KNOX lived in Edinburgh, and has arrived at the following conclusions:—For a few months in 1560 the Reformer seems to have been temporarily accommodated in more than one house, but all in the immediate vicinity of St. Giles. Before the end of that year, however, he had become the tenant of ROBERT MOWBRAY'S house, which stood on the east side of the close now known as Warriston's, with a tenement between it and the High Street, and was, in fact, on part of the site of the new Council Chambers. This he occupied from 1560 to 1566. In 1568 he was found occupying a house belonging to JOHN ADAMSON and BESSY OTTERBOURNE, but as they possessed three houses it was not certain which of the three was the one occupied by KNOX. Two were situated on the line of the east side of the present St. Giles's Street, and the third stood on the site of the recently removed poultry market, at the south end of the space to be occupied by the new offices of *The Scotsman*. No reference has been found that could afford identification of the residence of KNOX after November 1569. He left Edinburgh in May 1571, returned to it in August 1572 and died in November following.

IT is somewhat characteristic of a national weakness that while we are reproving foreigners for vandalism, a rather discreditable example of it is about to be perpetrated in Southampton. The Bargate compensated for the commonplaceness, which is inevitable in a modern port. The municipal council have decided that it interferes with the traffic, and they intend to remove it. They can say they are only following a metropolitan precedent, but the Bargate is not comparable with Temple Bar, and is not so much of an obstacle to locomotion. A history which has appeared in the *Southern Daily Echo*, proves the Bargate to be a structure of various periods, beginning with the Norman. It is connected through a variety of circumstances with English as well as local history. As the author of its history says:—"The Bargate pleads in all its architectural and antiquarian grandeur to be left alone, and we hope public sentiment will declare it has a claim to preservation. Desperate diseases, it is said, require desperate remedies, but there is no rule without an exception, and in the case of the Bargate the 'disease' is not so desperate as to require such an unheroic remedy as some people propose to apply to it."

THE forty-first session of the Society for the Encouragement of the Fine Arts has commenced. The first lecture will be given on the 19th inst. by Mr. J. S. SHEDLOCK on "CHOPIN: His Mazurkas, Polonaises and Preludes," with musical illustrations. During the session the following subjects will be treated:—"The Sacred Lake of the Incas," by Mr. JOHN WILSON; "The Elements of Design in Painting," by Mr. T. R. SPENCE; "The Diary of a Sarum Worthy of the Seventeenth Century," by Mr. E. DORAN WEBB, F.S.A.; "Some Goldsmiths and their Work," by Mrs. PHILIP H. NEWMAN; "The Growth of Art in our Public Schools," by Mr. ROBT. CAMERON, M.P.; "Lithography: Past and Present," by Mr. HENRY HEWKLEY; "The Schools of Painting of Sicyon and Ephesus," by DR. J. S. PHENÉ.

A POLISH lady has, it is said, purchased the Palazzo Sciarra in Rome for about 60,000*l.* It is not one of the best examples of its class. It was erected in the beginning of the seventeenth century from the designs of FLAMINIO PONZIO. The doorway is by some authorities ascribed to ANTONIO LABACCO, and by others to VIGNOLA. What has made the building remarkable is the wonderful collection of pictures, which was considered to be unsurpassed by any private gallery in Rome. In an excavation made in the Piazza Sciarra the ancient pavement was discovered, with fragments of columns, an inscription, and a gold medal. It is supposed that the triumphal arch which was erected as a memorial of the Emperor CLAUDIUS for his conquest of Britain stood there.

"'TIS SIXTY YEARS SINCE."

THE success of SCOTT'S "Waverley" has induced people to suppose that a period of sixty years is sure to be marked by great revolutions. Writing in 1804, he was able to contrast a "weak piping time of peace" with the warlike era of the Forty-five. It seemed incredible then to some sceptics that people could be living who had witnessed such feudality as is represented as existing at Glennaquoich, and which not even the necessities of a warlike expedition were able to control. SCOTT took great pains to demonstrate how real was the base on which his novel was raised. His models were the surviving "folks of the old leaven" he had known in his childhood. Many of the incidents introduced were, he says, received from the men who were actors in them.

Whatever may be the extent of social revolutions in a period of sixty years, it must be owned that with the arts it is not possible to have such marked contrasts in any modern period. New inventions may arise in those which are connected with science, but with the fine arts the case is different. In the latter so much depends on a few remarkable men who are endowed with special gifts by nature, it seems unwarranted to draw a conclusion between the merits of different periods. The artist is the child of his time, as SCHILLER says, but the power which makes him great is not derived from the Government he has to obey, or the people he daily encounters. We can analyse the character of his art, and give credit to the influence around him as one of the factors which gave it character; but, however exhaustive may be the process employed, there is always some element left which is beyond our tests.

Let us, for example, turn to the year 1839, and begin with the exhibitions. In the Royal Academy of that year were seen works by Sir DAVID WILKIE, C. R. LESLIE, DANIEL MACLISE, J. MALLORD TURNER, W. MULREADY, EDWIN LANDSEER, W. COLLINS, C. R. EASTLAKE, W. ETTY, not to mention others. Each of them had a manner of seeing things which distinguished him from earlier and later painters. Frequenters of the Academy exhibitions who will prize that which is forthcoming in the summer would not object to seeing such works on the walls as TURNER'S *Ancient Italy*, *Modern Italy*, *The Fighting Téméraire tugged to her last Berth*, WILKIE'S *Sir David Baird discovering the Body of Tippoo Sahib*, EASTLAKE'S *Christ Blessing Little Children*, MACLISE'S *Robin Hood* and *Gil Blas*, ETTY'S *Pluto carrying off Proserpine*, HERBERT'S *Brides of Venice*, which were in the exhibition of 1839. It was not considered a fortunate year by contemporary amateurs, but there were pictures then seen which deserve to be remembered. It is possible that the standard of the majority of painters in 1839 was lower than what now prevails, and, it must be owned, some works which were produced sixty years ago might never have existed so far as the present generation is concerned. It is, however, always best to judge a period by its best products, and if so tested, it is not apparent that 1899 will be much superior to 1839.

There can be little doubt that the architectural drawings of 1899 will be of a more attractive nature than those which were to be seen sixty years ago. But the ordinary art critics will not condescend to cast an eye on them, and in their indifference they are simply following their predecessors. In one of the journals of 1839 only a single drawing in the architectural collection was noticed, viz. OWEN JONES'S *View of the Alcove in the Hall of the Two Sisters in the Alhambra*. It owed its distinction to the gorgeous colour, which was made more sparkling, but not more artistic, by a liberal use of gold leaf on the ornamentation. The most important architectural drawing was the *Staircase of Goldsmiths' Hall*, by P. HARDWICK. He was not elected an Associate of the Academy until November. There was a measured drawing by C. J. PIERCE of the *Interior of the Madeleine, Paris*. W. RAILTON, who was in the course of the year selected to be the architect of the NELSON Column, contributed a view of the *Residence now erecting for the Bishop of Ripon*. There was a drawing of the *Eagle Tavern, City Road*, by the architect, P. S. PAUNET. The building has had many tenants and its life has come to an end, but in 1839 it was supposed to mark the beginning of a revolution in the character of the minor theatres. An innovator of that time who hoped to accomplish a reform of the arts by a close imitation of the work of an earlier period was WILLIAM DYCE, M.A., of Aberdeen. He sent a drawing entitled *Design for the façade of a Chapel in the style practised by the scholars of Giotto, in Upper Italy; intended to illustrate the polychromatic decoration of the end of the fourteenth century*. Afterwards Mr. DYCE was enabled to exercise much influence on the Government Schools of Design, and like subsequent directors without much profit to the country. Among other designs were those by H. E. KENDALL for *Chapels at the Rochester and Chatham Cemetery*, and for *Chapels, Westminster Cemetery, Earl's Court*, by T. ALLOM, B. BAUD and H. CASE. Amidst such neighbours it is no wonder OWEN JONES'S drawing dazzled the visitor, and from the effect produced the introduction of an Alhambresque style into England could not have appeared unlikely to the artist. JONES was, however, disappointed then and afterwards. Fortunately for him, he was able to employ the style in a humbler class of work.

At the time Classic in some form held sway. It was in 1839 the Gresham committee invited designs for the Royal Exchange. It was stipulated that "the new building be of the Grecian, Roman or Italian style of architecture, having each front of stone of hard and durable quality." There was some dissatisfaction caused by the demand of one pound for a lithographic plan of the site. The designs were submitted to Sir ROBERT SMIRKE, JOSEPH GWILT and PHILIP HARDWICK. On their recommendation the first premium of 300*l.* was awarded to WILLIAM GRELLIER, district surveyor; the second of 200*l.* to a M. DE CHATEAUNEUFF, of Hamburg, and ARTHUR MEE; and the third of 100*l.* to SYDNEY SMIRKE. The designs by WYATT and BRANDON, J. PENNETHORNE, T. L. DONALDSON, RICHARDSON and MOCATTA were selected for commendation. The Gresham committee in adopting the report requested the assessors to prepare a plan and specification for the Exchange from the premiated designs. They did not carry out the proposed manipulation. WILLIAM TITE and GEORGE SMITH, the surveyor to the Mercers' Company, were then asked to advise the committee. TITE declined. SMITH was handicapped, as GRELLIER had been his pupil. To endorse the decision of the judges would be to incur a suspicion of favouritism, to go against it would be assuming superiority to them. Under those circumstances so astute a practitioner as WILLIAM TITE could hardly fail to exercise his diplomatic powers most efficiently, and eventually he was entrusted with the work.

Another competition of which the result was unexpected was that for the Nelson Monument in Trafalgar Square. The committee of subscribers, on the advice of a sub-committee, adopted WILLIAM RAILTON'S design, which the author described as "well calculated to portray to posterity the progress of two sister arts at this period of the nineteenth century; and, withal, will not exceed the amount of the subscription." The column was said to be an enlargement of one of those at the National Gallery, which were taken from Carlton House. It was also foreseen that the hero would appear like a mastheaded midshipman. As ALBANY FONBLANQUE said, "To stick up an admiral at the masthead is much the same sort of thing as putting a grown gentleman into the corner with a fool's-cap on his head." But no ridicule could prevail with the committee.

A competition, or rather two, which ended in the erection of a noble building, took place in 1839. It was announced that the Council of the borough of Liverpool, having determined on the erection of new assize courts for the southern division of the county of Lancaster, were ready to receive designs for that building, for the erection and completion of which it was proposed to appropriate a sum not exceeding 50,000*l.* A premium of 300 guineas was to be paid for the design which the Council considered best adapted for the purpose, and 200 guineas for the second best. It was followed by another invitation for the erection of St. George's Hall, Liverpool, for concerts and other purposes. HARVEY LONSDALE ELMES, the son of JAMES ELMES, the biographer of WREN, was successful in both competitions. Arrangements were made to treat the two buildings as one, and the success of that plan has been confirmed by all who have visited Liverpool.

The principle of competition was admired by many architects in 1839, otherwise there would not have been

seventy-five designs sent in for the St. George's Hall. The benefit of the system was, however, counteracted too often by intrigue and jobbing. In the competition for the General Post Office ROBERT SMIRKE took no part. Before any decision was arrived at he was directed, as if there were no designs under consideration, to study the business transacted in the departments, and then to prepare a plan. THOMAS HOPPER, one of the competitors, maintained that his design was the basis of SMIRKE'S, and he published a pamphlet addressed to Lord MELBOURNE, with plates of the two, in order to expose the weakness of the competition system under circumstances which should guarantee fair play.

The most important building in progress during 1839 was BARRY'S Parliament House. It was necessary to construct an embankment, and for that purpose Messrs. WALKER & BURGES designed a coffer-dam. The wall was faced with granite, and has stood remarkably well against the force of the Thames floods. When the embankment was nearly complete tenders were sought for the erection of the front of the building and projecting wings. The amounts varied from 184,639*l.* to 159,718*l.* The latter came from Messrs. GRISSELL & PETO, of Lambeth, and was accepted. When the quantity of masonry to be executed is taken into account and the character of work demanded, the sum appears moderate. In 1839 prices were low, for labour was cheap. The trades union rate for mason's wages was 24*s.* a week, which in the course of the year was raised to 26*s.* It is easy then to understand how such a church as St. Mary's, Islington, accommodating 1,100 worshippers, could be erected for 3,500*l.* Bricks in 1839 were by a new Act subjected to a duty of 5*s.* 10*d.* per thousand when the size did not exceed 150 cubic inches. For those of a larger size the duty was 10*s.* per thousand. The charge was to be imposed while the bricks were drying, and the allowance for waste was 10 per cent. The only exemptions were bricks which were to be used for drainage of wet and marshy land, and for that purpose every brick was to be marked clearly with the word "drain," in order to be legible to the excise officers when visiting the brickfield.

The embankment of the river before the Houses of Parliament caused some apprehensions about the safety of Westminster Bridge, which was the last of the old Thames bridges. It might be considered as having an existence of a century, for although it was not completed until 1747, the foundation-stone was laid in January 1739. LABELEYE was the engineer, and the contract price was 28,000*l.* In order to keep the piers secure it was decided to sink piles about them and to carry out various repairs, for which the estimate was 103,000*l.*, an amount which suggests the increase in the cost of construction during a century.

A still older bridge was supplanted by a new structure that was opened for traffic in the early part of 1839. We refer to Bow Bridge. The bridge had endured over seven hundred years, for it must have been constructed between 1100 and 1118, since that was the period during which Queen MATILDA reigned, by whom it was ordered. At the time of its removal the arches were flat pointed or Tudor, which suggested they could not be older than the end of the fifteenth century. Originally the form was semicircular. Why it was called Bow Bridge cannot be ascertained. The engineers were JAMES WALKER and ALFRED BURGES. The latter was the father of WILLIAM BURGES, the architect, and survived his son. The report stated that very little attention appears to have been paid by the original builders to uniformity, as scarcely two corresponding points in the structure were found to agree. The springing courses were on different levels, and the piers were unlike in width and length. Another discovery was that originally the superstructure was not covered with gravel or paving to form a roadway. The traffic passed upon the masonry, in which ruts were worn in parts to a depth of nine inches by the wheels of waggons, and here and there were holes caused by horses' feet.

A London improvement which was talked about in 1839 was the embanking of the Thames. The Corporation informed the Commissioners of Woods and Forests that the time had arrived when "a survey and plan should be made of the river Thames, for the purpose of ascertaining the most desirable line of embankment on both sides of the river from London Bridge to Vauxhall Bridge, and also the expenses of making the proposed embankment, and of excavating and deepening the bed of the river where required; and that a Bill should be brought into Parliament in the next session for embanking the river Thames, according to a plan to be agreed on, in which power should be given to the Commissioners of Woods, &c., to embank the bed and soil of the river opposite the Crown property, and that power should be given to the Corporation either to embank themselves, or to permit the owners of the wharfs and property on each side of the river to embank, under their directions, upon such terms as may, upon consideration, be thought desirable; half of the expense of the survey and of the Act of Parliament to be borne by the Commissioners of Her Majesty's Woods, &c." JAMES WALKER, who was the Government referee in all cases of hydraulic construction, was appointed to undertake the inquiry. Many years had to elapse before an attempt was feasible to realise the project, and although much has been done yet there is still no quay on either side extending to London Bridge.

In the obituary of architects the most important name is that of the designer of the National Gallery, WILLIAM WILKINS, who died in his sixty-first year on August 31. He attained distinction in Cambridge, and on his return from Greece he found commissions awaiting him. He was the original architect of University College, and among his works are St. George's Hospital, and University Club House. Haileybury College, is another of his works. He designed the Nelson Columns in Great Yarmouth and Dublin. At Cambridge his skill was often called in. He was the architect of Downing and Corpus Christi Colleges, and of the additions to Trinity and King's. WILKINS did not neglect literary work. He brought out an edition of "Vitruvius," and was author of "Antiquities of Magna Grecia," "The Topography and Buildings of Athens," and "Prolusiones Architectonicæ." WILKINS was a Royal Academician and Professor of Architecture. In one sense he was unlucky, for there was a prejudice excited against him which nothing he was able to perform could overcome. Another architect passed away in 1839 who had gained much repute among managers of theatres, viz. RUDOLPH CABANEL. He was a German, and was understood to be acquainted with all the mysteries of stage construction. The old Coburg Theatre was designed by him, and he devised a roof which bore his name long after his death. GEORGE SAUNDERS, F.R.S., should also be mentioned, for he was formerly architect to the British Museum, where he built the Townley Gallery; he was a diligent and learned antiquary, and the author of a very interesting and valuable paper containing the results of an inquiry concerning the condition and extent of the city of Westminster at various periods.

Among the painters who expired in 1839 the best known was Sir WILLIAM BEECHEY, an Academician since 1797, and the first who received knighthood on REYNOLDS'S death. He was born in 1753. The *beau monde* patronised him, and Queen CHARLOTTE appointed him to be her portrait-painter. Another veteran was HENRY SINGLETON, who died in his seventy-third year. He was an artist for whom there was no progress, and to the end he preserved the style of treatment to which he was initiated in his youth.

In those days it was considered a necessity to devise schemes of reform for the Royal Academy. A collection of them suggests how hopeful are aggrieved artists and amateurs, for they should know the Academy is incorrigible. Poor HAYDON, who tried so often, consoled himself, in his pamphlet of 1839, by saying that no distinguished artist was ever produced by an Academy, and that the days of the Royal Academy were numbered. More satisfactory to the bailiff-hunted artist was his conviction that "a feeling is generating, a taste spreading, which in the end must beat down all opposition, and render doubts of our genius in 'high art' absurd." HAYDON could not have foreseen how his high art pictures in the Egyptian Hall were to be unvisited while crowds were rushing to see "Tom Thumb." Another reformer of 1839 was EDWARD EDWARDS, who held that the Academy could strengthen its functions by the adoption of four heroic measures, which were as follows:—

(1) In the separation of its functions as assembly of honour and as school of instruction from those which are connected with the annual exhibition, confining it wholly to the former. (2) In the removal of the limitation as to the number of its

members; the recognition of engravers as full members, forming an integral part of the academic body; and the abolition of the class of associates. (3) In the appropriation of such a sum from public funds as shall be sufficient, when added to the proceeds of the funded property at present possessed by the Academy, to provide for the liberal increase of its means of instruction—as lectures, collections and the like—and for its future permanent maintenance as assembly and as central school; and (4) in adequate provision for the official inspection of its schools, and for the publication of periodical reports upon its general proceedings.

The list of prize-winners of 1839 was, however, suggestive that with adequate materials the Academy could turn out able artists. JOHN HENRY FOLEY obtained the silver medal for the best model from life; FROST the gold medal for historical painting; EDWARD FALKENER (who afterwards wrote "Dædalus") the gold medal for the best architectural design; HENRY LE JEUNE, now a Honorary Retired Associate, a silver medal for a copy made in the painting school, and the award of a medal for a drawing from life; FREDERICK STACKPOOLE, who is also on the retired list, a medal for a drawing from the antique; THOMAS HAYTER LEWIS, a silver medal for a drawing of the University Club House, Pall Mall. There were other prizemen who did not produce much to uphold the reputation of the Academy, but those we have named turned their teaching to good account. The fame of FOLEY is not yet diminished, and may endure for another period of sixty years.

In 1839 there were many people who believed the days for the arts of representation were over, for the glorious sun was to stay in his course not merely to play the alchemist but the artist. DAGUERRE, the French scene-painter, had exhibited examples of his sun pictures. FOX TALBOT claimed priority for his photogenic drawings. During a great part of the year there was a controversy on the subject, and it must be said justice was rendered to the foreigner. In one of FOX TALBOT'S numerous and lengthy statements we find the following description of an apparatus which anticipated those in use by modern architectural photographers:—

> The most curious application of this art is the one I am now about to relate. At least it is that which has appeared the most surprising to those who have examined my collection of pictures formed by solar light. Everyone is acquainted with the beautiful effects which are produced by a camera obscura, and has admired the vivid picture of external nature which it displays. It had often occurred to me that if it were possible to retain upon the paper the lovely scene which thus illuminates it for a moment, or if we could but fix the outline of it, the lights and shadows divested of all colour, such a result could not fail to be most interesting. And however much I might be disposed at first to treat this notion as a scientific dream, yet when I had succeeded in fixing the images of the solar microscope by means of a peculiarly sensitive paper, there appeared no longer any doubt that an analogous process would succeed in copying the objects of external nature, although indeed they are much less illuminated. Not having with me in the country a camera obscura of any considerable size, I constructed one out of a large box, the image being thrown upon one end of it by a good object glass fixed in the opposite end. This apparatus being armed with a sensitive paper was taken out in a summer afternoon and placed about one hundred yards from a building favourably illuminated by the sun. An hour or two afterwards I opened the box, and I found depicted upon the paper a very distinct representation of the building, with the exception of those parts of it which lay in the shade. A little experience in this branch of the art showed me that with smaller cameræ obscuræ the effect would be produced in a smaller time. Accordingly I had several small boxes made, in which I fixed lenses of shorter focus, and with these I obtained very perfect but extremely small pictures, such as without great stretch of imagination might be supposed to be the work of some Lilliputian artist. They require, indeed, examination with a lens to discover all their minutiæ.

Photography by itself was sufficient to make 1839 memorable.

A Meeting of the Society of Biblical Archæology was held on Tuesday, when Dr. Gladstone, the chairman, referred with regret to the recent death of Professor Hayter Lewis, in whom, he said, the Society had lost a distinguished member, and one whose friendship was valued by all who knew him.

MAINS FOR ELECTRICITY SUPPLY.

By F. J. WARDEN-STEVENS.

(*Continued from page 9.*)

HAVING dealt with the actual cables and methods of laying them, the details of joint boxes and service connections will be of interest.

Joint Boxes.—Of course, whether mains be direct-laid or drawn-in, there is a limit to the length of a cable. This is the length in which it is made, and in the case of a feeder does not exceed 440 yards at the outside. It is therefore necessary to make joints even in feeders. In distributors there have to be more frequent joints for the purpose of house services, and so there are two classes of joint boxes—one for a simple connection and the other a tee connection for services.

With a direct-laid or built-in system there are as a rule very few, if any, joint boxes appearing on the surface, they being usually of cast-iron filled in with a suitable semi-solid compound and buried. With lead-covered cables, the lead covering is sweated to a brass tube which is then screwed into the iron box. These iron boxes are of sufficient size to allow of the two cable ends being connected by means of clamps and copper bars. The copper connecting pieces provide for a cable being continuous without any actual joint. The covers of such boxes are generally clamped down on to a rubber or similar packing, the box then being filled with the compound. This in the case of tee joints is a usual course, but in some cases a much simpler joint box is provided—a casting the shape of the joint, whether tee or straight, is used, being made in halves. The joint is made in the usual manner, and some packing is wound round the cables where they pass through a gland in the casting; the two halves are clamped together over the cables, squeezing the packing, and the whole is filled in with compound.

In the case of a drawn-in system these joints are placed in brick chambers, which are of two kinds, those for drawing-in purposes and those for service connections. The first named are comparatively large, and are provided with street covers, which should be watertight, and at the same time ventilated. With conduit systems there is a considerable danger of gas being admitted through leakage, and as a consequence there is danger of explosion either in the boxes or conduits. This has been provided against by erecting ventilating shafts to boxes, but they have not proved very successful, as there is no circulation unless an inlet is provided as well as an outlet. Artificial ventilation by means of fans has been supplied in some cases to keep conduits clear. In other cases the course is adopted of filling all boxes with sawdust or wood blocks, thus reducing the space available for gases to collect. It must be borne in mind that all conduit systems, whether bare copper or otherwise, are partly liable to explosions, and that nothing but good ventilation and insulation will prevent such explosions. Gas will percolate through the soil, and will get through almost anything. An electric spark will ignite such gas, and the damage is done. It is only with direct-laid systems that this danger is altogether averted, and in such systems the street boxes, if any, can be thoroughly sealed. Service boxes used with conduit systems are usually small brick chambers which contain a simple joint box, as previously mentioned.

Drainage.—The drainage of a system of mains and joint boxes requires great care, especially with the bare copper system. A very usual and effective method, where the drainage system in a town is good and the sewers are never full, is to lay the conduits with a slope to certain boxes and to connect these through a trap to the sewers. Any water will then pass away, but it must be borne in mind that should for any reason the water back from the sewer to the mains considerable damage may be done, and even the non-return traps are not safe; they may stick at the critical moment.

Services.—Service connections are generally run in iron pipes, but this is not altogether to be approved. The objections are that this method is not sufficiently flexible to overcome obstacles such as drains, gas and water

services, which may be also entering the premises, and also it forms a passage by means of which objectionable odours may be introduced into the premises. Lead-covered or armoured services are more flexible and convenient, or one of the solid bitumen system may be used. Service connections should be arranged so that they may be attached or detached while the current is on, as it is not advisable to discontinue the general supply too frequently. The service boxes are often arranged with clamped connections and simple switches in the boxes, in order to attain this end.

Conditions of Use of the Various Systems.—It is, of course, impossible to specify the exact conditions which will make it advisable to use a particular system, but some idea can be given.

The overhead system is, according to the Board of Trade regulations, permitted for electric lighting only in districts which may be particularly defined as "rural," although for tramway purposes they are allowed in towns. It is somewhat to be regretted that this is the case, as for small towns and straggling districts this system offers particular advantages, and renders electric lighting possible in many circumstances where without it electricity could not be economically distributed. The great advantage of overhead cables is that the cost of fixing is very low. With underground mains it costs as much to lay a small cable as a large one, and in consequence where cables are small the cost of laying is more than that of the cable.

The overhead system offers facilities for extension, which is a considerable advantage when it is desirable to commence an electric-lighting undertaking on a small scale, owing to uncertainty as to the demand probable; then, as the demand increases, the capacity of the cables can be easily increased. This system is also of importance when it is desired to light the whole of the streets in a country town, in some of which there may be no possibility of a private demand, and therefore would not justify the expense of underground mains. It is generally considered that the overhead cable system for electric lighting seems to be of a temporary nature, and in consequence very little attempt has been made to improve it. If some of the restrictions at present placed upon the use of overhead cables were removed, there is little doubt but that both the appearance and reliability would be very much improved.

In the overhead system the cables, which may be either bare or insulated, are supported on wood or iron poles by wall brackets or by standards on roofs, the method of fixing depending upon the conditions as to width of streets, relative cost of iron and wood poles in the district, the cost of obtaining wayleaves, &c. In fixing bare cables, they are supported on insulators attached to cross-arms. These insulators must be sufficiently strong to stand the strain of the cables, and the cables must also be strong enough to carry their own weight. When of copper the cables are hard drawn, in order to increase their tensile strength. If the cables are insulated, they are supported by thongs to steel wire at intervals of about 1 foot. The steel wire takes the weight and protects the insulation on the cables.

The Board of Trade regulations lay down the law that the supports for overhead cables must not be further apart than 200 feet, or 150 feet if the line is not straight, and every metal support must be efficiently connected to earth. Every support must be properly stayed against wind pressure or forces caused by changes in direction of the line or unequal lengths of span. The maximum pressure of the wind is taken as 50 lbs. per square foot, and the strength of the cables as being equal to not less than six times the forces applied, and the support twelve times. The minimum height of the cables is 18 feet above ground, or 30 feet crossing a street, or within 5 feet horizontally and 7 feet vertically from any building or erection other than the support, except where brought into a building for purposes of supply.

In making a service connection, the wires should be taken from the nearest pole to a point on the consumer's premises which cannot be reached except by a ladder, and insulated conductors should be taken into the building.

In the case of high-pressure cables, they must be insulated thoroughly, must be supported by a suspension wire by means of insulating thongs, and they should never be fixed to buildings. High-pressure conductors should, however, not be overhead in a public place, and in practice their use is generally confined to long distance transmission across fields, &c.

Direct-laid systems in the first place are not advisable where cables may have to be enlarged; under these circumstances it may be taken that a conduit system is the cheapest in the end. It is also obvious that a conduit system is of very little use if there are branches in the conduits between the drawing-in boxes, which effectually prevent a cable from being drawn out. This is usually the case with distributing mains. The only possibility is that cables may be drawn into the ducts to strengthen the distributors at a later date.

With distributing mains it is generally admitted now that they should be laid down at once of sufficient size to meet any future demand. If they should require increasing, the same effect can be produced by increasing the number of feeding points. It is therefore quite a usual practice to adopt a direct-laid system for distributing mains.

Of the direct-laid systems it may be said that the bare copper system is the best and cheapest where the conditions are favourable. In the case of insulated conductors the cost of insulation is heavy with large cables, while the cost of insulators in a bare copper system is practically the same, whether the conductors are large or small. A bare copper system takes up a considerable space, and is not flexible; it is therefore unsuited for use in a ground crowded with other pipes and culverts.

The direct-laid armoured system is suitable where there are no corrosive substances or gases in the soil; it is inexpensive, but the cost of service connections is high with this system. As a matter of fact, it is often adopted for feeders as well as distributors, and in cases where the number of services is small compared with the length of cable laid it is very suitable.

The laid-in bitumen systems are largely used for distributors; no armouring is required, separate cables can be used and service connections are easily made.

As has been previously mentioned, drawn-in systems are not so particularly suited for distributors as for feeders. In the former case services and tee connections have to be cut before a cable can be withdrawn, whereas with feeders there are no such connections. The feeder runs straight from the generating works to a point on the mains, and no tappings are taken for any purpose. It is also often necessary to alter the sizes of feeders, as when an undertaking is started it is difficult to estimate accurately the current a particular feeder will have to carry, and it may become necessary to alter the size later to suit the demand.

In deciding upon the particular conduits to use, local circumstances have a great effect. Prices of conduits vary in different districts; the nature of the ground, space available, and many other considerations arise which make it impossible to give any definite opinion.

In drawing in cables great care must be exercised, as otherwise the insulation may be damaged, strands in the cable may be broken and conduits may even be cracked. The work of drawing in must be supervised by a thoroughly qualified and experienced electrical engineer, and also care must be taken that the conduits are smooth on the inside. A winch is sometimes used for drawing in cables, but it is to be avoided and hand-drawing substituted if possible. By the latter method any serious obstacle is easily detected, while with the former the drawing in may be continued and the cable damaged.

Lead-covered cables are now used considerably for drawing-in systems, and special care is required in handling paper-insulated cables of this class, as they are rather brittle, and sharp bends may break the insulation.

A few of the chief regulations with regard to underground mains may be of interest here.

All metal conduits or pipes containing any electric mains must be efficiently connected to earth, and be so jointed and connected across all street boxes and other openings as to make good electrical connection throughout their whole length, and isolated lengths of metal pipe must be adequately earthed.

Where the conductors placed in any conduit are not continuously covered with insulating material, they must be secured in position, and no unfixed uninsulated material of a conducting nature must be contained in a conduit. No such conductor must be at a higher pressure (above

earth) than 300 volts. Adequate precautions must be taken to insure that no accumulation of water shall take place in any part of the conduit, and to prevent any dangerous access of moisture to the conductors or insulators, and the insulators must be so placed that they can be readily inspected.

Every portion of any high-pressure electric main placed above the surface of the ground or in any subway not in the sole occupation of the suppliers must be completely enclosed in a tube of highly insulating material embedded in brickwork, masonry or cement-concrete, or in strong metal casing efficiently earthed. A high-pressure electric main must not be used for the transmission of more than 300 kilowatts, or in the case of an overhead cable 50 kilowatts, except with the consent of the Board of Trade.

The maximum working current in any conductor must not be sufficient to raise the temperature of any part of its insulation to such an extent as to alter its properties, and such increase of temperature must never exceed 30 deg. F. The sectional area of the conductor laid in any street must not be less than the area of a circle of one-tenth of an inch in diameter, and where the conductor is formed of strands of wires each separate wire shall be at least as large as 1-20 S.W.G; this also applies in the case of an overhead cable.

The covers of all street boxes must be so secured that they cannot be opened except by means of a special appliance. All street boxes and conduits must be regularly inspected for the presence of gas, and if any influx is discovered the supplier must give immediate notice to the authority or company whose gas mains are laid in the neighbourhood of the street box.

It must be borne in mind that the mains are a most important part of any electricity supply undertaking, as upon them depends the continuity of supply. The mains cannot be duplicated as can the machinery at the works, and so it is even more important that they should be well designed. Further, the mains are not so accessible and cannot be examined daily. The consideration of being able to supply any consumer from two different directions is also of great importance, as otherwise a failure in one cable will cut off the supply. By a judicious arrangement of feeders and loops in distributors it becomes impossible for more than a few consumers at the most to be disconnected through a fault in any cable.

This now concludes the question of the mains and the methods of laying, and I shall next proceed to the systems of distribution and generation of electricity.

THE NATURAL HISTORY MUSEUM, BIRMINGHAM.

ALIKE as a teacher, constantly struggling to satisfy aspirations and realise ideals, and as having had some years' experience in responsible charge of a university museum at Cambridge, this question is of keen interest to me, says Professor Hillhouse in the *Birmingham Post*, and I may be pardoned for taking part in what appears thus far to be a "one-sided controversy."

Excluding buildings of a national character, the conception of the Natural History Museum at Oxford appears to me to be, from the conjoint public and teaching point of view, an ideal one, though naturally upon a somewhat broader scale than would be needed here. Essentially it consists in a large and lofty hall, with glass and iron roof supported upon ironwork of peculiarly light and graceful construction, amply lighted in all parts, and with floor and wall space occupied by exhibition cases constructed and arranged upon a uniform and logical plan. But the museum is also, as it always ought to be, the focus of systematic teaching; and around it are lecture theatres, laboratories and working rooms, all lighted from the outside, with their upper floor approached by a broad continuous gallery, which surrounds the exhibition hall, and adds to the floor and wall space available for exhibition purposes, though at Oxford this gallery is needlessly massive and darkening. If in the future the University of Birmingham were to erect a natural history museum for teaching purposes, it would doubtless endeavour to collect around it in the same way all the departments concerned in field natural science or anthropological teaching. At first sight it may seem a bold proposal, but is it quite out of the question that this same method should be adopted in Birmingham, and now? Let us start with one or two preliminary considerations. On the one hand we have a strong desire, many would say urgent need, which finds expression at frequent intervals, that our grand assemblage of municipal teaching institutions should have its one broad and patent gap filled by the erection of a natural history museum, to which hitherto site and finance have both been obstacles, the former having now ceased to be a difficulty. It is urged that no more humanising influence exists than is provided by a love for nature, that no development of the faculty of observation is so keen and true and healthy as that induced by the "field" sciences. For both purposes it is urged that a natural history collection open to free public access is essential. On the other hand there are very large collections—zoological, geological, botanical—already existing, in scattered form, for teaching purposes, of chief importance amongst them being the collections which will belong to our new university, which have long outgrown the space devoted to them, and as to the increasing needs of which the respective professors have for years past made annual appeals to a sympathetic but impecunious college council. Is it not possible for these two parallel needs to be economically and satisfactorily brought together? Birmingham is now engaged in building up an university which will be, in a broad sense, a municipal institution, and the honour derived from or due to which will redound to the honour of Birmingham as a city, just as fully as if it were financed directly from the municipal purse, just as fully, for example, as with the school of art. If the City Council were to decide to grant an annual sum to the university finances or to endow certain professorships, such as public health or bacteriology, though it might be a departure from the principle of exclusive control over money spent (not always insisted upon, by the way, as *e.g.* with the Drainage Board), it would only illustrate the fact that money given from the municipal chest to properly controlled objects, existing solely for public purposes, is money taken out of one public pocket and put into another, with the chance of occasionally losing a coin in the transfer, but the certainty of great material and moral gain. The whole principle of Government grants is based upon this.

Allow me, then, to put the present case in hypothetical fashion thus. Suppose the City Council to enter into reciprocal relations with the new university, the former to provide and maintain a public natural history museum of the Oxford type, with lecture-rooms, laboratories, working-rooms and offices for botanical, geological, zoological (and anthropological) purposes; the latter to transfer to this new building its existing departments as above, with their entire staffs and the large collection in their charge, and to wholly finance these departments for teaching purposes upon exactly the same lines as if they were retained in their present home; and the respective staffs to be required, as they now are, to look after the maintenance and proper display of the collections which thus far have been in large measure due to their own personal activities. What now would this "suppose" mean from the points of view of city and university? I take for granted that the museum would be open to the public, and that it would be developed upon lines which would provide whatever is desirable for public purposes, for, in point of fact, as every practical teacher knows, these differ in no essentials from purely educational needs. The City Council, representing the public purse, would construct the buildings as capital expenditure, and would provide an annual charge, represented by rent of site, general maintenance and repairs, wages for the attendance necessitated by the public use of the museum, for cleaning the public parts, and for sufficient working assistants for actual museum purposes. There would be no need whatever for a highly-paid staff of curators, this work being done by the staff of professors. An annual vote for specimens would also doubtless be needed, though much material might be expected from private gifts, Government gifts and loans, and the private activity of the professors in charge. The university, on its part, would provide and pay for the whole of the teaching and laboratory staff, and maintain everything required for its own particular teaching purposes, and its professional staff would act as a board of curators. The university would further hand over its own extensive natural history collections, worth probably some thousands of pounds. In other words, in return for the use of the special portions of the museum buildings devoted to systematic teaching, the university would provide skilled supervision for the public museum, which it and its professors would largely endow with specimens. The university, on its part, would naturally profit by the more complete facilities for teaching certain subjects, and by the freeing for other expansions of parts of the present college buildings now in use by these departments.

I venture to think that such an arrangement would be mutually profitable, relatively inexpensive, would save needless duplication or overlapping, and be in no wise one-sided in its material advantages. If by chance any should disagree upon this final point, may I once more revert to the general principle that from the point of view of our full civic life money given to or expended by City Council or university court is, in equal degree, money received and spent by and for the community at large? May I further venture to illustrate the potentialities,

of such reciprocal action by pointing out that for many years my own department at Mason University College has profited largely owing to the supervision of the Edgbaston Botanical Gardens having been so fully placed in my hands, while I would fain hope that some equivalent advantage has accrued to the Botanical and Horticultural Society and to the public generally. This is a small matter, but serves to show what might be expected upon a large scale from such reciprocal action as is suggested above.

TESSERÆ.

The Future of Art.

IT has been held by some that the progress of the arts may, or rather must, be unlimited; by others that they can now only experience decay; but their sensuous character and dependence upon emotion prevent either of these results from taking place—on the one hand, by limiting their progression, on the other, by preventing all possibility of their extinction. The passions and sentiments of man, although continually upfurrowed by moral and physical changes, which so alter the appearance of society that its product presents widely different characteristics at different times, in their grand features they remain as immutable as the senses themselves. A discovery in science or the recognition of a political principle may give variety to the exertions of man; but the continual renewal of his race is the continual renewal of the same desires, hopes and fears—love, grief and joy are constantly reborn; and it is only a truism to assert that in the passions are the foundations of art laid. Based on these, at once may be recognised the cause of the permanency and of the fluctuations of art—permanency as related to the constitution of man, which produces its constant renovations at different epochs; fluctuations that result from the direction that is given to the operations of the constitution amid those great changes which sweep in continual revolution the mind and condition of the human race, with such recurring tides that it would almost appear that the limits of the atmosphere of our globe not only bound a circumscribed portion of visible and tangible being, but also of intellectual and moral being.

Timanthes's "Sacrifice of Iphigenia."

It has been the fashion to illustrate the principle of leaving something to the imagination by the ancient picture of the "Sacrifice of Iphigenia," where we are told that Agamemnon, the father, was painted hiding his face in his robe. The expression of grief and horror had been given in the countenance of the other bystanders, and it was left to the imagination to divine what passion would have been depicted on the face of Agamemnon if that robe had been torn aside. Lessing, and after him Girardin, have indeed given a different account of the intention of the painter. The Greek artists, say they, sedulously avoided that distortion of features through excessive grief which was incompatible with beauty of form. They would tone down the expression, as Lessing argues that the sculptor did in the features of Laocoon, until it became consistent with the lines of beauty. Timanthes, therefore, finding that in order to render with fidelity the expression of Agamemnon, he must admit such a distortion of the features as would violate this rule, chose rather to veil the countenance. But we would suggest that something else must have weighed with the artist; for if it was an acknowledged principle of Greek art rather to sacrifice a portion of the passion, so to speak, than to admit a distortion of the features, why should Timanthes have felt any scruple, in this instance, in modifying the expression of the father's countenance in obedience to a known rule of art? Why should he have thought himself obliged to resort to the expedient of concealing the face? Is it not more likely that Timanthes painted Agamemnon in the attitude he did, simply because it was the most natural—because it was, in fact, the only attitude in which it was possible to conceive a father present at the sacrifice of his own daughter? Other spectators might have looked on with different degrees of grief or horror, but we feel that the father could not look; he must veil his head. This natural attitude, bespeaking the grief it only seemed to hide, was no doubt highly expressive.

Picts' Houses.

There are stone remains in Scotland of a dreary and mysterious darkness—the Picts' houses, or Eird houses of the north, belonging to an age who shall say how many centuries older than that of the old square keeps? You enter crawling along a cavernous drain-like passage, which descends and widens into a chamber. This chamber may be from 3 to 6 feet high and 20 or 30 feet long. Its sides are made of rough huge stones, laid on each other so that the walls converge upwards, where great blocks of granite are laid across them. You pass through a lateral narrow opening, and enter another chamber of a like character. Some of these houses have three or more chambers. They are met with in fields, where the husbandman has for centuries passed the plough over them, unconscious of their existence, or of any farther peculiarity than a slight ascent, with a projecting stone or two dangerous to the plough. Nor are these cavernous edifices mere rare anomalies. In some places, and chiefly in the upper basin of the Don, there are complete villages of them. Professor Stuart, in a paper read to the Antiquarian Society of Scotland, mentioned between forty and fifty as the number opened in one parish. It is in the Orkney Isles, however, that they are found on the largest scale, and most elaborately built. The tradition of the country, not unnaturally, associates these and other mysterious antiquities with a race which, according to the popular but now superseded history of Scotland, was extinguished in conflict with the nation now occupying the soil. Hence they are deemed the dwelling-places of the Picts or Pechts, being endowed with elvish faculties and malign propensities. They are supposed to have been of superhuman strength, but diminutive and dark, and no wonder when such were their habitations. With the Orcadians, the possible existence of a lingering remnant of the Pechts, dwelling in the recesses of the earth, is still a matter of substantial apprehension. Mr. Stevenson, the engineer, the father of the author of 'Treasure Island," when passing through Orkney on lighthouse business, was called upon by the people of a small tavern to decide for them a very important point. A being was then asleep in one of their beds whom they verily believed to be a remnant of the accursed and not quite extinguished race—so diminutive was he and so black withal. Now, if their suspicions were well founded, they would be under the disagreeable necessity of putting him to death, and this was just the question which Mr. Stevenson, being a lighthouse engineer, should decide for them. On entering the chamber, Mr. Stevenson, with curious sensations beheld, in unconscious and peaceful repose, the familiar face of an old schoolfellow. He was a being of slender proportions and not very comely visage, but of a restless, enterprising, enthusiastic character, being no other than the Rev. John Campbell, subsequently renowned in African missionary history. Did, then, human beings live here in chambers not much wider than graves, in contact with the slimy walls and with the company of a few snails and toads?—no rats, for the rat would not inhabit such a place. That houses of this laborious structure should have been built for the people at large is out of the question, so that we must suppose them to have been in a manner the mansions of the aristocracy.

The Ruins of Baalbec.

On all sides are gates of marble of prodigious height and magnitude; windows or niches fringed with the richest friezes; fallen pieces of cornices, of entablatures, or capitals; magnificent vaulted roofs; everywhere a chaos of confused beauty, the remains of which lay scattered about or piled on each other in endless variety. So prodigious was the accumulation of architectural remains that it defies all attempt at classification or conjecture of the kind of buildings to which the greater part of them had belonged. After passing through this scene of ruined magnificence an inner wall is reached, and from its summit the view of the interior is yet more splendid. Of much greater extent, far more richly decorated than the outer circle, it presents an immense platform in the form of a long rectangle, the level surface of which is frequently broken by the remains of still more elevated pavements, on which temples to the sun, the object of adoration at Baalbec, had been erected. All around that platform were a series of lesser temples — or chapels, as we should call them—decorated with niches, admirably carved, and loaded with sculptured ornaments to a degree that appeared excessive to those who had seen the severe simplicity of the Parthenon or the Colosseum. But how prodigious the accumulation of architectural riches in the middle of an eastern desert. Combine in imagination the Temple of Jupiter Stator and the Colosseum at Rome, of Jupiter Olympius and the Acropolis at Athens, and you will yet fall short of that marvellous assemblage of admirable edifices and sculptures. Many of the temples rest on columns 70 feet in height and 7 feet in diameter, yet composed only of two or three blocks of stone, so perfectly joined together that to this day you can barely discern the lines of their junction. Silence is the only language which befits man when words are inadequate to convey his impressions.

The International Archæological and Anthropological Congress, at Moscow, decided to hold the next meeting at Constantinople, and in case political difficulties interfered, Athens or Bucharest was to be substituted. As all three are ineligible, it is proposed to hold the Congress in 1900 in Paris, although that city seems to be the least adapted of all for peaceful deliberations on scientific subjects.

NOTES AND COMMENTS.

IT was a popular belief that when the Romans first saw the Tay and the North Inch at Perth they cried out, "Ecce Tiber! Ecce Campus Martius!" In the opinion of Sir WALTER SCOTT the exclamation was no great praise, and he wrote the following epigram upon it: "'Behold the Tiber!' the vain Roman cried, viewing the ample Tay from Baiglie's side; but where's the Scot that would the vaunt repay, and hail the puny Tiber for the Tay?" It would be creditable to the Romans to be impressed with so delightful a scene, but there is no authentic evidence that any Roman soldier uttered a word of praise on reaching the heights near Perth. According to a paper read by Dr. JAMES MACDONALD in Edinburgh, the first mention of the story is in a book printed in 1638, called "The Muses' Threnodie," by HENRY ADAMSON, a native of Perth. In this rhyming dialogue on the antiquities of Perth the author relates the arrival of AGRICOLA's legion and their joyful encampment on the meadows of the Tay, in which they recognised a likeness to the Campus Martius on the banks of the Tiber. This ancient story, he says, he found in an old manuscript. In 1757 the forgery of BERTRAM, which appeared in the shape of a treatise on Roman Britain, professing to be compiled by a monk called RICHARD of Cirencester, and which deluded many antiquaries, gave new prominence to the claims of Perth as a Roman station. PENNANT in 1769 states that the people of Perth relate with singular pleasure the tradition of the Roman army exclaiming "Ecce Tiber!" when they came in sight of the Tay, and although JAMES CANT in a second edition of ADAMSON's "Threnodie" in 1774 characterised the part relating to AGRICOLA's army as a poetical fable, the tale had caught the popular ear and speedily passed, through the medium of the "Statistical Account" and other local literature, to the dignity of accepted historical narrative. It is known that the Romans were in Perthshire, but with regard to the many stations, camps and roads which are popularly called Roman, there could be no assurance until they had yielded such positive evidence as had been obtained by the recent excavation at Ardoch.

THERE have been many attempts to illustrate the beautiful objects in the South Kensington Museum, but the new work brought out by Messrs. LONGMANS, GREEN & Co., of which the first part has just appeared, is superior to all its predecessors. The plates are on a large size (12 by 9 inches), and therefore will allow the details of work in the precious metals, lace and carving to be properly appreciated. In the first number there are twelve sheets, showing examples of wood-carving, gesso-work, sculpture, leather, glass, bronze, silversmith's work and brass. It is announced that the intention is to supply teachers and students in art and technical schools, designers and all engaged in the practical production of artistic and useful articles with the best types which the Museum contains, at a cost which will bring them within the reach of all. "The requirements of junior students will be considered and catered for, as well as those of the more advanced and of the thoroughly-finished workman; the idea, generally considered, being that of placing before the workman the best types of form and choice details of ornament, care being especially taken that in the ornament all necessary tooling will be shown in such manner as to be readily copied by the workman." The first part shows how well the project is likely to be realised. The work is edited by Mr. WITTHAUS, and he will have the aid of some of the officers attached to the Museum.

THE majority of people who take an interest in such subjects are convinced of the responsibility of the Municipality of Venice for the neglect of the public buildings of the city. What seems more reasonable than to confer as far as possible the privileges of the ancient Council on the elected representatives of the citizens? But in respect of such a work as the Doge's Palace the State monopolises all the rights of ownership. The Minister of Public Instruction is the responsible representative, and his instructions are given to the local architects of his department. The arrangement corresponds in some measure with that adopted in France, and which is supposed to have preserved the buildings. A similar arrangement is often proposed for adoption in England, especially for the cathedrals. Municipal councils are not always remarkable for good taste or good sense, and in general they decline to respect traditions. From time to time changes in the character of buildings under their control must be expected. In Venice there is much scope for innovation, and it is as well the authority to determine the extent of alterations is to be found at a distance. All that has been said against the Municipality recently is therefore applicable to the Department of Public Instruction in Rome.

ILLUSTRATIONS.

CATHEDRAL SERIES.—DURHAM: CHOIR, LOOKING WEST. VAULTING OF SOUTH AISLE. ARCADE, CHAPTER-HOUSE.

THE screen which appears in the illustration of the interior is a rather simple structure, if compared with many other screens which were erected in modern times in English churches. But in 1876 it was sufficient to prevent the Bishop from preaching at the opening of the cathedral after the restoration. His lordship wrote to the Dean, saying:—"You look down from the cathedral on the parish of St. Oswald's, in the patronage of the Chapter, in which two new churches are earnestly needed, one of which at least might have been built for the sum now expended on an Early English screen and an Italian pavement hardly in harmony with the simple grandeur of the Norman edifice. Whilst therefore as a visitor to the cathedral I shall be always ready to support any measures for its improvement which I can conscientiously approve, as bishop of a diocese in which the population and consequent spiritual wants are increasing at a more rapid rate than in any other English diocese, I cannot give my countenance to an expenditure of Church funds which, in my judgment, has been unwise and wasteful." Where there is only a limited sum of money for religious purposes, it is difficult to determine what is the most profitable way in a spiritual sense to distribute it. To build new churches is a good work, but Dr. LIGHTFOOT should have remembered that the cathedral is an inheritance which should be preserved for future generations. The revenue of the Dean and Chapter was supposed to be in part at least applicable to conservation, and they were acting rightly in expending money to make the cathedral adapted to the use of modern worshippers. The obnoxious screen did not, we believe, cost 600*l.*

OFFICES FOR MESSRS. IMAY, IMRIE & CO., LIVERPOOL.

RAPHAEL HOUSE, MOORFIELDS, E.C.

THE new premises in course of erection by Messrs. RAPHAEL TUCK & SONS have a frontage to Moorfields of 96 feet, and return frontages to White Street and Tenter Street of 137 feet and 74 feet respectively. A handsome entrance-doorway is situated in the centre of the Moorfields front, with a projecting pediment supported by caryatides, and above are two life-size figures carved in stone representing Art and Commerce. The whole of the front is executed in Monk's Park stone, with a Portland stone base. The entrance-door leads into a spacious hall, at the further end of which is a fine staircase with passenger lift, and on the right is the counting-house, and on the left the board-room. On the first floor are the offices of the principals and a show-room, nearly 40 feet long, and various other rooms and warehouses. On the upper floors are the artists' rooms with a good north light, and two goods' lifts are situated in Tenter Street and White Street. The premises will be heated by hot water from a heating apparatus in the basement, and electric light will be used throughout the building. The staircases will be of fireproof construction, and the plastering of the ceilings and walls will be in asbestic plaster. The total floor areas will be about 50,000 superficial feet. The fronts in White Street and Tenter Street will be in red brick and stone, and white glazed brick. The basement has been built by Messrs. MARK PATRICK & SON, and the superstructure is being executed by Messrs. PATMAN & FOTHERINGHAM. The carving will be executed by Mr. GILBERT SEALE, and the lifts by Messrs. WAYGOOD and the Otis Company. The architect is Mr. W. HILTON NASH, of Bush Lane House, E.C.

SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

BY THE AUTHOR OF "ECCLESIOLOGIA GERMANICA," &C.

(*Continued from page 427, Vol. lx.*)

VIII.

Tours.

WE now proceed to inspect more closely the architectural features of St. Gatien's, a church which has peculiar claims to the interest of Englishmen, having been commenced by Henry II., whose birth at Le Mans should have been recorded by us when sketching the features of that city. Built almost immediately after the destruction (from incendiary causes, as usual) of the Romanesque cathedral—a structure apparently of very considerable extent—the radiating chapels and arcades of the choir are in the earliest Pointed; indeed, the windows of the former cannot be said to have quite shaken off the Romanesque element.

Although inferior in size and importance to the vast northern cathedrals, Tours yields to none in solemnity of effect and delicacy of detail. At a first glance it appears, both externally and internally, commonplace (if we may use such a term), but a lengthy or repeated visit will serve to dispel this feeling, and the building will be found, after a careful survey, to enshrine everything that is elegant in detail and proportions; besides

TOURS: WEST FRONT OF THE CATHEDRAL.

which it is one of the few French cathedrals showing finish in all its parts and no traces of incomplete plan. The choir and its surroundings are the earliest portions, if we except some remains of Romanesque work in the bases of the towers. That the arcades of the choir at Tours lack that richness of foliaged ornament common to Auxerre, Troyes and Bayeux cannot be denied, yet, viewed from either transept, the Doric simplicity of its five acutely-pointed arches on piers composed of a cylinder with four encircling shafts, all with boldly-foliaged capitals, is undeniably imposing. So are the narrow stilted arches of the apse. Next in point of date come the choir, clerestory and triforium, the transepts and the first two bays, counting from the east, of the nave. These belong to the Middle Pointed period, which they admirably represent. Of especial beauty are the windows in the clerestory and triforium of the choir, presenting a perfect lantern of old stained-glass—the glory of Tours and the subject of a monograph from the pen of the late Chanoine Bourassé, who, associated in his ecclesiological studies with Chanoine Manceau, did much towards the improvement of the cathedral about 1846-48. Till nearly the middle of the fifteenth century, when the nave from the second bay east was commenced, no further progress seems to have been made at Tours, but the work once taken in hand was carried steadily on into the Flamboyant and Early Renaissance periods—the marvellous west front, with its twin towers crowned by small scaled domes, from which unhappily the "melancholy gold" has been scraped, completing the work. All the splendour which precedes decay characterises the style in which this western façade of Tours—by no means on the gigantic scale of Rouen or Troyes—is built.

A difficulty occurred in the construction of Tours Cathedral, which occasioned a somewhat unsightly irregularity in the north transept. It appears from an inspection of the plan of this church that its constructors, being anxious to lessen the width of the building from the commencement of the nave, found it requisite to deviate from the line of the choir piers by bringing the large transeptal columns at the north-east angle a few feet inwards. This materially had the effect of disarranging the vaulting of the westernmost end of the north aisle of the choir, making it necessary to construct the east wall of the transept at an acute angle, and to throw out an enormous flying buttress from the outer angle of this transept.

TOURS: NAVE OF THE CATHEDRAL.

So great is the span of this buttress that a street and part of a garden run under it. The transeptal roses are magnificent, though the effect of the northern one is impaired in some degree by a huge buttress carried up the face of the transept, from the causes enumerated above. The diminution of width in the nave as it approaches the west is very marked, but it has the effect of increasing the length and adding considerably to the charm of the view westward, which terminates in a noble traceried and stained-glass window free from organ gallery or any other encumbrance. The Flamboyant work at the west end of the nave aisles is likewise extremely bold and fine. We know of few French naves so beautifully arcaded as this of Tours, and we lingered long during our several enraptured visits at its north-west or south-west angle, wrapt in admiration of its graceful attached piers, which seem to melt one into

another. A similar effect is produced by the naves of two of our loveliest minsters—Lichfield and Worcester—though in a purer style, and perhaps more graceful in their proportions.

The ritualism of the cathedral of Tours is not remarkable. Tall iron screens surround the choir on west, north and south sides, and from its roof depends a chandelier with three lights. The great organ is in the south transept, as at Le Mans. We do not remember a French cathedral whose nave aisles are so contracted as those of Tours—a narrowness rendered still more conspicuous by the chairs which project from the nave, leaving only a very narrow passage between them and the flanking chapels. One of these chapels (that of the Sacred Heart) at the east end of the north aisle has a modern altar and reredos of singular beauty. The former, of stone, is, as usual, without antependium, and its mensa rests upon three small columns with gilt caps and bases. The stepped predella has eight arcades with niched figures, and supports the candlesticks. In the centre of this rises a lofty Gothic arcaded tabernacle richly painted and gilt. Another good modern altar is that of the lady chapel, which, as usual, has been profusely coloured. Its three lancets contain old glass from the church of St. Julian, and is apparently collected from several windows there. The north and south walls have frescoes of the Marriage and Death of the Virgin, and of her Annunciation and Assumption. The chief feature of the altar in this lady chapel at Tours is the throned figure of the Virgin and Child above the tabernacle. It is most graceful. The predella, too, is of much elegance, with paintings of the Presentation and the Entombment. Other interesting points in the choir aisle at Tours are the fenestration of the first oblong chapel on either hand by a couple of plate-traceried two-light windows, having in the head a sexfoil; and some paintings in the northern of these chapels, curious, solemn, naturalistic, and representing in oblong panels the Apostles, St. Luke taking the place which belongs to St. Matthias. As we leave the cathedral by the west door a Sister of Charity approaches the bénitier and takes the holy water very reverently, kneeling. The great central door is thrown wide open, and we shall never forget the air of simple, solemn grandeur which the nave, ruby stained by the great window, presented about half-past six in the afternoon of our second day in Tours.

The exterior of St. Gatien's does not present many features of interest. The lofty clerestory, nave chapel and transept windows make a goodly show; but in point of splendour and leaf-like delicacy the tracery cannot compare with that in the same position at Troyes. Perhaps the most pleasing external feature, after the harmonious Flamboyant west front, with its tall flanking towers and graceful series of arcades just under the central gable, is the apse of the choir, spreading itself out at the base where the chapels cluster in dignified amplitude, soaring, but not at all exaggerated in its clerestory. There is no tower at the crux, the masses of roof meeting at an insignificant nondescript turret surmounted by a tall cross, for we are in France now, and not in Normandy, where the central tower almost always constitutes one of the grandest external features of the churches—as at Rouen, Fécamp, Lisieux, Dives, Coutances, and Evreux.

Altogether Tours is a most fascinating and instructive cathedral. We came prepared for disappointment, we went away enchanted; while its situation in the eastern part of the city, remote from the busy streets, seems to impart to its immediate surroundings a certain air of calm seclusion, wanting, however, in those picturesque features which, almost without exception, find a place in an English cathedral precinct.

We have so dilated upon the architectural glories of St. Gatien as to render our notice of the other churches of Tours somewhat brief. Dismissing, briefly, Notre-Dame de la Riche and St. Saturnin as large, late Gothic churches, with few features to recommend them beyond their spaciousness, town-like air and elaborate fittings, we proceed to speak more particularly of St. Julian's and of the imposing but as yet incomplete modern basilica of St. Martin's.

Turner depicts St. Julian, in his "Seine and Loire," at "an hour after sunset, with no moon, and torchlight." At that time it was a diligence office, and the drawing, which shows the south side of the nave and transept, was made from the Hôtel d'Angleterre, where the artist was probably deposited on arrival. Ruskin cites this drawing as an instance of Turner's love of chiaroscuro, and as being especially remarkable for its preservation of deep points of gloom, because the whole picture is one of extended shade.

TOURS: APSE OF THE CATHEDRAL.

Rescued from the degraded state to which it had fallen in 1847, St. Julian at Tours has since been well restored, and now presents all the features of a grand cruciform church built during the palmiest days of French Gothic—the age of St. Louis. It stands so hidden among the houses at the corner of the Rue Nationale and the Rue Colbert that its grand nave, clerestory and transept came upon us quite by surprise—a surprise by no means diminished when we descended the few steps leading from the south door to its interior, and beheld its almost cathedralic proportions and distribution of parts. It consists of a low Romanesque western tower, a five-bayed nave with triforium and clerestory, transepts, and choir with double aisles, of which the external one on either side is prolonged into a poor sixteenth-century apsidal chapel. The choir has a square east end, lighted by a noble window of eight lights; below it, extending the whole width of the wall, is a frescoed "Last Supper," with a background of gold. This, taken in conjunction with the excellent glass in the window above—

small subjects in roundels—has a very rich appearance. The same arrangement of fenestration occurring in the square-ended choir of the cathedral at Dol may be accounted for by the fact that Tours is the patriarchal see of Brittany. At St. Julian's, Tours, the choir is the oldest part, indicated by its tall cylindrical columns, with their stiff-leaved capitals. This, dating from the 'teens of the thirteenth century, would be coeval with Rouen choir and Soissons generally. The transepts and nave of St. Julian are later, and belong to the more advanced Pointed of 1224. Here the pillars are of the Amiens sort—thick cylinders with a slender shaft at the cardinal points.

Throughout the church the workmanship is very fine, and while sitting near the sacristy door in contemplation of the magnificent clusters of piers at the crux, and making notes thereon, we are accosted by a priest, who emerges from that sanctum, and says, "Bonjour, monsieur; est-ce que vous dessinez?" He is too polite to *tutoyer* us. "Non, Monsieur le Curé," we reply; "j'écris." "Voudriez-vous me montrer votre livre?" "Mais oui, certainment," we reply. "Gracious!" we think, "now we are in for it," as visions of French *mairies*, fearful as those which presented themselves to Mr. Ledbury, flit before the mind. However, after a few minutes' puzzled scrutiny our curé returns the book with a pleasant smile. The names "Senlis," "Noyon," "Chartres;" the adjectives "grand," "splendid," "magnificent," "enchanting," &c.,

TOURS: INTERIOR OF ST. JULIAN'S.

have doubtless caught his eyes, and in a moment we are the best of friends, and in the midst of a delightfully snug little conversation, winding up by his placing a chair for us in one of the best positions for taking the noble proportions of the church at a *coup d'œil*. "If there is any part of the church you wish to see," resumes our friend, "the sacristan is at hand to conduct you," as with a bow which would have done honour to a courtier of the time of the Grand Monarque, he retires to the sacristy. We avail ourselves of the privilege thus accorded, but, as it is rather too hot to rush about triforia and what not, rest content with a view from a small private garden of the external eastern elevation, emerging by a door, doubtless the entrance to the lady chapel.

By this time the afternoon has worn away, so we take tea at a café in a fine open space formed at the junction of the Rue Nationale and the Boulevards Heurteloup and Béranger, and then saunter forth for a walk round the walls in the direction again of St. Julian's, where prayers and Benediction of the Blessed Sacrament are announced to commence at eight o'clock. Our walk takes us along the boulevards in a north-easterly direction, there being a gentle rise all the way, so that having the walls on our right, we look down upon the Loire and Cher Canal and market gardens. To our left rises the enormous mass of the cathedral, its outline clearly defined against the sunset sky. The two great towers of St. Martin's are brought into the picture, and extremely grand they look. We have to pass the cathedral, so cannot resist a walk round in the now quickly gathering darkness. Truly awful is the silence of the vast building—a silence broken only now and then by a cough or a chair scrooping. We make just one complete circulation, arriving at the west door as the sacristan jangles his keys, eager to lock up, and then proceed on our way to St. Julian's, whose interior, impressive by day, looks doubly so illumined here and there by a few gas jets, which serve to throw out very markedly its exquisite details, many of which, notably the flat soffits of the arches, irresistibly remind us of Scott's church of St. Mary, Stoke Newington.

(To be continued.)

From the account of the Liebfrau Kirche at Trèves which appeared in our last number, it might be concluded that only one of the windows had been filled with modern stained-glass of Belgian manufacture. Unfortunately this unsatisfactory school of vitreous decoration extends throughout the beautiful series of windows, whose arrangement in two tiers in the apse recalls that at Marburg and Xanten.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at 9 Conduit Street, Mr. G. H. Fellowes Prynne, president, in the chair.

The following were elected members:—Messrs. F. Mount, H. G. Turner and J. M. Lethbridge.

Mr. Hampden W. Pratt was elected trustee of the Association Travelling Studentship in place of the late E. C. Lee.

Mr. H. H. Statham read the following paper on

House-Planning from the Æsthetic Point of View.

When Mr. Paul Waterhouse read his interesting paper on "Oriels and Bay Windows" before the Association a few weeks ago, he commenced it by praising the judgment and benevolence of the Council of the Association in themselves laying down or suggesting the subject to be treated, thereby setting the reader of the paper a definite task, saving him from the onus of making up his mind on a subject, and encouraging him to acquire some definite information on the subject he had been invited to treat of. And he implied that this was the course now usually pursued by the Association in asking for papers. If that is really the case, why have I been, so to speak, left out in the cold? No such benevolent and stimulating process of selection of a subject was exercised on my behalf. I was asked simply to read "a paper," the universe being left open to me for choice. The universe is doubtless a fine field, but a little embarrassing to select from. Under such conditions the only course is either to take a subject which you have for some reason or other been led to think about, or—to decline. I do not approve of what may be called "paper-making" for its own sake. If people tell you that they wish for your views on some particular subject, it is another matter. You may give them your views, even if the subject is one not specially interesting to yourself. Otherwise, on two or three occasions when other societies have been complimentary enough to ask me for a paper, I have felt compelled to say frankly that there was no subject on which at the moment I had any particular opinions or thoughts which I was anxious to give expression to; therefore I must decline. I recommend my own moral example to others who receive general invitations to read papers on any subject they please. It is a dangerous temptation and tends to put papers in the same category as after-dinner speeches, where you speak not because you have got something to say, but because you have got to say something. In one of the finest verses in the Psalms we read:—"While I was musing the fire burned; then spake I with my tongue," but not till then. If you have nothing to say, don't be persuaded to say it. And therefore, if the Council of the Association have, as I gathered, made it a general practice (though not applied in my own case) to specify the subject when inviting anyone to read a paper, I recommend them to keep up that practice; only I would suggest that, after specifying the subject, a rider should be added—"unless there is any other subject which you specially wish to

treat." By tying a man absolutely to one subject you may possibly be preventing him from dealing with another which he would treat better; and if he is willing to dispense with the assistance given by having a definite suggestion made to him, it is probably because the other subject is one that he really cares about.

So much for the general ethics of the paper-chase, which are worth a little consideration. In the present instance the request of the Council for a paper happened to reach me at a time when my mind was rather full of a subject on which I had wished sooner or later to say something; and therefore I could not do better than say it here, thereby complying with your request without falling into the sin of paper manufacture.

Although the architecture of the house cannot, except in the case of such mansions as may be called palaces (which are necessarily somewhat rare) rise to the architectural grandeur of the temple or cathedral, yet there is no branch of architecture more fascinating in its interest. It is the most intimately connected of all with the lives and characters of men. In an architectural sense, the designing of a house is not merely the arrangement of rooms so as to be comfortable in themselves and commodious in their relation to one another, though these are points of the greatest practical importance. That is a merely utilitarian view of the problem. The object of architecture is to transfigure the house from a collection of rooms conveniently arranged, to raise it to the level of a distinct and individual architectural conception or idea which should govern the whole arrangement; to give it as much of interior effect as is compatible with its size and with the practical convenience of internal traffic; to make it something more than a mere dwelling-place; the expression of an artistic thought—whole, complete and indivisible. Of course it will be said that we take a great deal of trouble to make houses architecturally expressive or picturesque. We have our pilasters, our window pediments, our balustrades, our broken cornices over the doors, and pots on the attics and cut-brick cherubs and garlands; or our gables and roofs cutting into each other in different directions and at different heights, our sham half-timbered walls and coloured rough-cast, and plaster devices and what not, but all these will not save our souls; a house may have them or not have them, and be neither much the better nor much the worse in either case. The plan is that in which the artistic idea of the house is really embodied; that is the basis of the whole; if there is a good idea in the plan, even bad external detail cannot entirely spoil it; if there is no idea in the plan—nothing beyond a commonplace collocation of rooms in convenient positions—the best exterior detail will do little or nothing to conceal the poverty of the main conception. Of course in any case the treatment of the masses of the plan is half the problem; and as we shall have occasion to notice, there have been splendid plans which have not been made nearly as much of as they might have been in regard to exterior architectural effect; but it is mainly the plan which distinguishes the house which embodies an idea from that which does not.

Now in this respect among others, the Mediæval revival, so vaunted at the time, has left an ill influence behind it. To take the ordinary scale of dwelling-house first; it is since the Mediæval revival that we have been taught to regard the ordinary sized dwelling-house plan as consisting merely of the fitting together of so many parallelograms of room-spaces, something like a puzzle map, the end of one abutting on the side of another, the angle of one projecting beyond the wall of another, so as to show where the rooms fit on to each other; the result being a plan that is no shape at all, and which cannot be walled and roofed in under the guise of any formal and distinct architectural conception. This way of building is supposed to be "picturesque" and "truthful"; a house is a collection of rooms and it is to be treated so; it accords with the irregularity of nature, and so on. A house is not called upon to accord with the irregularities of nature any more than a garden; it is an artificial creation and should be treated as such. If it is a mere collocation of rooms, that is the architect's fault; it ought to be something more; it ought to be a plan conceived as a whole, the rooms designed and placed so as to be subordinate to that governing idea while retaining convenience of internal position. That is just the crux of artistic house-planning; the mere irregular fitting of rooms together is an evasion of it. And if we look back at the history of the habitation, we find that after men had emerged from that primitive stage in which, as the soldier sings in "Philip van Artevelde"—

> Two sticks and a mat
> Make a very good house,

at a comparatively early period they arrived at the perception that a house should be planned on a centre line, and should have so much of interior architectural effect as space permitted. We may take, for convenience sake, three types as given by Viollet-le-Duc in his "History of the Habitation"; they must not perhaps be taken as quite archæologically accurate, for Viollet-le-Duc possessed imagination as well as industry, and (like other French archæologists) what he thought probable he treated as historic fact; but they are probably near enough to fact in their main characteristics. In the Aryan house on the banks of the Upper Indus, a locality which has long been the accepted "cradle of the human race" (though Mr. Traill complains that "they are moving that bassinette about a good deal lately"), we see a plan drawn out on a centre line, and with the large outer court and inner hall for family life, which is the precursor of the atrium of the Roman house, probably through the "aithrion" or open-air hall of the Greek house. In the Ionian house we have the same centralised system, but the inner rooms have increased in importance; and it is curious to notice on one side what would now be called the "stable wing," much as we see it placed in some of the English eighteenth-century mansions. Then we have the Greek house, in which the inner colonnaded hall has become the principal feature, and provides a really fine piece of interior architectural effect in a house of moderate dimensions, and which we find reproduced more or less in the Pompeiian house. We cannot in this climate have the open-air colonnaded apartment in the centre, though we can have something like it in the disposition of apartments. I am not arguing necessarily in favour of bilateral symmetry in the average-sized house, though I am inclined to say that in the majority of cases bilateral symmetry in the main masses at least (with diversity in some of the details) will produce the best architectural results, more especially in the case of a house which is combined with a garden. We have all learned to recognise of late years the beauty and suitability of the formal garden, differentiating the garden, as a work of art, from the informal lines of nature; and the formal garden will only go well with the formal house. But apart from the bilateral question, at all events we ought to see the house modelled on a distinctly conceived and predominating design which moulds the whole of it; not merely put together as the rooms may fit conveniently. The attempt to do this, as it appears to me, is not often made among us. Occasionally we see such a thoroughly original conception as that house by Mr. Prior, of which the model was exhibited two or three years ago at the Academy. A small house by Mr. Townsend, of which an illustration is exhibited, is noteworthy as an example of a plan and architectural treatment which form a complete and original conception; so is the plan of a house by Mr. Horsley, with its entertaining rooms and gallery en suite on the garden front, forming a much more dignified architectural interior than is generally attained in a house on this scale; and other examples will probably occur to some of my hearers. But in the attempt to give special character and unity of conception and design to houses of average size, both the Americans and the Germans are a good deal in advance of us. I am thankful to say that I cordially hate modern German architectural style and detail for the most part; but in turning over a collection of plans of German houses one is surprised to find what an amount of variety and ingenuity are shown in the arrangement of the plan, and how little of the ragged and accidental character which is so often found in English plans; they are almost always laid out in accordance with a leading idea which gives unity to the whole. We have a good deal to learn from the Germans in this matter of house-planning on an architectural system; it is when they begin to raise and to decorate the elevations that they make such a terrible business of it.

But let us turn now to what in my own mind was the main object of this paper, the treatment of plan in the largest class of houses—those which can be dignified by the name of "mansions." It is here especially that the taste fostered by the Mediæval revival has injured us. The Mediæval mansion was in the first instance the castle, and the castle and the habitable portions included in it were naturally built with what we now call a "picturesque irregularity," which was not picturesque in the eyes of those who built the castles, but simply utilitarian. Castles were usually, or one might say always, built in as commanding and as isolated a position as could be selected, to secure them the better against attack by force or by surprise. The plateau on which they were built was often irregular in shape, and the most was made of it; after the castle had expanded to something beyond the mere "keep" or single tower, the outer wall followed the natural line of the high ground, and the habitable buildings were got in where it was most convenient and where they were safest. It was only when the times became a little quieter and more civilised that castles or châteaux began to assume regular forms uninfluenced by the nature of the site. We can see the change in progress in the plan of the Château of Chambord, where the inner and outer blocks with their angle towers are quite symmetrical in disposition, but internally the circular towers are cut up by partitions in a quite irregular manner; they are still purely military and utilitarian towers, their circular shape having no reference to any object but their engineering suitability as angle defences. With the commencement of the Renaissance period, when architects had become familiarised with the symmetrical temple buildings of the Romans, came

the age of the great symmetrically-planned mansions, first in the Elizabethan form of the courtyard or quadrangle, next in the later Renaissance form of the main central block and the outlying "wings." Later in the Georgian period the wings disappeared and the symmetrical block alone remained; the accessory buildings, such as stables, laundries, &c., no longer forming any portion of the main design, but being relegated to separate buildings at more or less distance from the house. Then after the Gothic revival came the idea that symmetry was not picturesque; there was a reaction against the formal plan, and then followed the taste for what I call the rambling plan, in which the object apparently was to make it appear as if the plan had grown up by accident, or had arisen from the gradual enlargement of the house by successive additions. This habit of deliberately planning a house to look accidental and picturesque is, like the twisting walks and quasi-natural plantations of the landscape gardener, an entirely modern invention. For houses of the largest class there is no precedent for it in any previous age. The irregular castellated dwellings of the Mediæval period, as already observed, were irregular for merely utilitarian reasons—to suit the site and make the most of it. There are various old houses in the country which have arrived at picturesque irregularity by dint of successive additions and alterations, but I think there are few if any that were deliberately built so, without anything in the nature of the ground to suggest such a treatment. It is a modern fancy engendered by the Mediæval revival, and so far as it has been adopted it has robbed us of the finest and most impressive architectural qualities which are possible in a great mansion.

Those who were present at Mr. Aston Webb's charming little lecture to the Class of Design at the beginning of the session will not have forgotten his remarks on the advisability of having a little mystery or surprise in the planning of a house. Inasmuch as the host generally rather enjoyed showing his guests over the house, there was not the same occasion for plain and direct planning as there was in a public building where strangers had to find their own way about. I quite agree with that as far as it refers to the average-sized dwelling-house. But when you come to the largest class of mansion, mystery-planning may become an inconvenience rather than an enjoyment to the guest. Your host may give himself the pleasure of escorting you from the smoking-room through a labyrinth of passages to your bedroom door at night, but in the morning you may find yourself under the necessity of ringing for a servant to show you the way to the breakfast-room. This is a mere point of convenience, not of art, but it is worth consideration. It is a nuisance to be losing yourself in a great house, and getting into the wrong rooms. But this is a minor consideration in comparison with the æsthetic one. It is often urged, I know, that the rambling and irregular house is the more homelike. But it is forgotten that a mansion on the largest scale may (I say, should) aim at something more than homeliness. It is to some extent a house of state; it should aim at the qualities of stateliness and dignity. And it is here that the great charm of house architecture comes in. Here there is the opportunity of combining architectural dignity with novelty and originality of grouping—the interest of arranging and shaping rooms so as to combine architectural effect with convenience. There are no by-laws or requirements of public bodies to hamper the architect; if his client is wealthy and really wants a fine and impressive house, the architect has the opportunity of evolving and shaping a new and original architectural creation which may be of the highest order, and imparting to it the dignity and symmetry which should belong to an architectural design thoroughly thought out and modelled. To adopt the rambling plan is to throw away a great deal of this opportunity. The rambling plan is not shaped at all, it is merely thrown together; it is supposed to afford a basis of picturesque effect, which really means a crowding together of different blocks of building, with a tower at some corner where you do not expect it, without any real design at all. The picturesque, in that sense, is not a difficult business; but what has become of the dignity which should belong to the great house of the neighbourhood? "The stately homes of England," as they are called in some popular ballad, are stately no longer. Compare, for example, the block plan of Castle Howard with that of one of the rambling plans; the one is obviously the foundation for a dignified and grandiose mansion—the other may have character, but it can have no grandeur; it is a shapeless plan destitute of any leading idea.

It is worth while to endeavour to realise what the ideal mansion of the great philosopher of the Elizabethan era, was when he published, towards the latter end of Elizabeth's reign, his famous essays, including the one "On Building." In Bacon's time the courtyard or quadrangle system of planning was still in favour, and he requires no less than three courtyards before you get to the house, an arrangement which I should think has never been carried out in actual building, unless it were a Babylonian palace or an Egyptian temple. The three courts are to form a kind of crescendo for the state approach to the house; first "a green court with a wall about it; next a court of the same, but more garnished with little turrets, or rather embellishments on the wall; and a third court to make a square with the front" (the front of the mansion to form one side of it), "but not to be built nor yet enclosed with a naked wall, but enclosed with terraces leaded aloft . . . and cloistered on the inside with pillars and not with arches below." The last words are rather obscure. I think there ought to be a comma after "arches," and that he merely means that he wishes the cloister to be a colonnade and not an arcade; an indication of the Renaissance taste for columns which was just then beginning to reach England. This is the only indication of style in architectural detail that can be extracted from the description. When we come to the house itself, the front is to have on one side a great banqueting hall 40 feet high "for feasts and triumphs;" this is to be "above stairs" (*i.e.* it is to be raised on a lofty basement storey), with a room for preparation under it. The other side of the house is to be in two storeys, the main one divided into a hall and a chapel, and "at the farther end a winter and summer parlour;" this looks as if one parlour was to face to the front and the other to the inner quadrangle, that on the sunny side being of course the winter parlour; in that case "the farther end" means the end farthest from the centre axis of the building. The two sides of the front are to be "uniform without, though severally partitioned within," a principle which was destined to be only too well carried out in many an English house of the following two centuries. Beyond this front is then to be a fair court ("quadrangle"), but three sides of it a lower building than the front; the return on the banquet side to be all stately galleries, with three or five cupolas in the length of it; the other side to be ordinary presence chambers and some bedrooms; but all three sides to be "a double house without through lights on the sides that you may have rooms from the sun both for forenoon and afternoon." This is rather lightly said, and could surely have hardly applied to the side with the "stately galleries." As to communication, probably Bacon counted on all these rooms opening out of each other as they do all round in such mansions as Burleigh House and others, and even with the greater part of Hampton Court, which is of course a good deal later. Four staircases were to be placed in turrets projecting into the court at the re-entering angles. Embowed windows have their advantages; "they be pretty retiring places for conference; and besides they keep both the wind and the sun off, for that which would strike almost through the room doth scarce pass the window. But let them be few; four in the court and on the sides only." He probably means two on each of the return wings; the front wing could not have one, as the centre entry to the quadrangle would be in the way. The quadrangle is not to be paved, "for that striketh up a great heat in summer and cold in winter"; only with paved side and cross walks, and the four spaces laid out in grass. Beyond this court is to be another of the same size and height, which (outside) is to be environed with the garden on all sides, and on the inside, "cloistered on all sides upon decent and beautiful arches, as high as the first storey." This cloister apparently is to be an arcaded one. "On the under side, towards the garden, it is to be turned into a place of shade, and only have windows towards the garden—*i.e.* on the outer side of the buildings. Then, after a reference to the arrangement of the rooms on the fourth or further side, he adds that here there is to be "on the ground storey a fair gallery open, upon pillars." This description forms a curious coincidence with the actual arrangement of the second court of Trinity College, Cambridge, where there is an arcaded cloister on three sides, and an entirely open space on the fourth side, with piers to carry the library above. Bacon adds that the third storey, on this further side, is also to be "an open gallery on pillars, to take the air and freshness of the garden." In this upper gallery there were to be fountains running from the walls. One further detail, "At both corners of the further side, by way of return, let there be two delicate or rich cabinets, daintily paved, richly hanged, glazed with crystalline glass, and a rich cupola in the midst." I confess I cannot make out exactly where these "delicate cabinets" were to be placed.

Such is Bacon's idea of a great mansion on the quadrangle principle of plan. It would not be a bad study for the Academy or the Institute to set as the subject of one of their prizes—the Travelling Studentship or the Soane Medallion—to restore Bacon's mansion in plan, section and elevation. Bacon, it may be observed, deals only with the superior portions of the mansion. "As for offices," he says, "let them stand at a distance, with some low galleries to pass from them to the palace itself." This is really much the way they were placed by Vanbrugh at Seaton Delaval, only that Vanbrugh had them flanking the front or entrance courtyard of the house; masked by the colonnades, it is true, but still pretty well in evidence, whereas I think Bacon wanted them out of the way of notice altogether. "Offices" probably did not with him include the kitchens, as he rather implies these would be in the basement.

(*To be concluded.*)

EXCAVATIONS IN THE FORUM ROMANUM.

WE lately gave a short account of the excavations which were in progress in the Forum by order of the Italian Minister Signor Baccelli, under the direction of Signor Boni, architect. The following more detailed account of the operations by Mr. Richard Norton has appeared this week in the *Times*:—

Some two months ago the present Minister of Public Instruction, Signor Baccelli, gave permission for certain explorations to be carried out in the Forum. For years it has been a great desire not only of archæologists, but of all who were intelligently interested in the antiquities of Rome, that the Forum should be put in order. It would be difficult to find another spot in all the world that has suffered more from intentional destruction wrought by the artists of the Renaissance or from incompetent modern excavators. The architects of St. Peter's and of other noble monuments of the Renaissance may be excused for having sunk shafts in the Campo Vaccino and taken the blocks of the Temple of Cæsar or of the Regia for use in the buildings with which they were beautifying the Rome of their day, but no apology whatever can be found to cover the shamefully ignorant and destructive work that has been done of late years under the name of excavation.

Though harm once done can never be entirely corrected, the work that is now going forward will, in a measure, counteract some of the blunders that have been made. First attention was turned to the little ædicula at the north-western corner of the Atrium Vestæ. Since the excavation of the house of the Vestals in 1883, large portions of this shrine have been left scattered over the ground, suffering constant petty damage from accidents or from tourists. The blocks cumbered the ground and they could not be satisfactorily studied. Now, however, under the direction of Signor Giacomo Boni, a Venetian trained as an architect, one of the most competent of the Government officials, the podium, one of the columns, base and capital complete, one of the pilasters at the back, and the entablature with its inscribed frieze have been put in position. The place of the second column has been taken by a simple and unoffensive brick pier, which next spring will be hidden by a climbing rose. No one can sensibly question the wisdom of this work. It is not restoration, it is merely reconstruction along sure lines. Where sure indications are lacking, theory is not allowed to take their place. Very different was the manner in which Rosa rebuilt a pier of the Basilica Julia. True, a similar motive inspired his work, but the method in which he carried it out could not well have been worse. The materials that he used were quite new and the form that he gave them was inaccurate; he failed to notice that the piers had formerly been provided with bases, some of which are still in situ, and in erecting his pier without a base he made a construction such as had never existed. Signor Boni has been directed to take down this anomaly and to place in their original positions as many of the blocks of the basilica as it may be possible to find.

Work about the Temple of Vesta followed that at the ædicula. The unexplored mound of earth that had been left by the last excavators upon the site of this temple is a characteristic example of the miserable lack of thoroughness with which the Forum (to say nothing of other sites) has been excavated. From this formless mound protruded here and there broken ends of walls. What these walls were and whither they went could not be seen. The mound was said by Lanciani, Middleton and others to be a solid mass of concrete. Had any of these writers poked the mound with a cane they would have soon discovered that the extent of the concrete was very limited. Under Signor Boni's direction the earth and débris have been carted away, and some very interesting constructions brought to light. Within the circle of the foundation walls is a brick chamber, one wall of which is destroyed. The entrance (if entrance there were) seems to have been from the top. The style of the brickwork points to Hadrian's reign, although one brick (which, however, did not belong to these walls) has been found to bear the stamp of Theodoric. What purpose was served by the chamber is difficult to say, but it is satisfactory to have replaced a shapeless mound by a construction of which the form, at least, is intelligible. The work did not end here. Having cleared the foundations and discovered parts of the steps Signor Boni turned his energies to the superstructure and gathered together the scattered pieces of columns and ceiling. One entire shaft and several more in an incomplete condition have been found, while numerous bits of the coffered ceiling are ready to be clamped together. If enough is found to sanction the re-erection of these pieces, a very valuable addition will have been made to the Forum. It is safe to say that not one person in five hundred of those who have, hitherto, strayed over the site of this the most sacred temple of all Rome have had even an approximately accurate notion of its original appearance. During the work quantities of fragments of vases of all ages were found. Only one of these was of much interest, but this one makes up for the unimportant quality of the rest. It is a fragment of a Greek red-figured vase of the best time showing the figure of a warrior. Was it such ware as this the Vestals used?

Care has also been bestowed upon other monuments near the Temple of Vesta. Between it and the Temple of Castor are a mass of remains of a shrine, the original name and site of which are unknown. Middleton points out that they exhibit finer workmanship than any other monument in the Forum, and says that they were drawn by Ligorio, in whose time they were dug up near the church of San Adriano. Ligorio's design resembles these blocks, but those to which I refer are not the blocks he drew. The present blocks were found where they now lie, and probably when the corner of the Forum now occupied by the church of Santa Maria Liberatrice is excavated the foundations of the shrine will be discovered, for on the Capitoline plan we see a small building in just this spot. For the present Signor Boni has been satisfied to collect some twenty-five pieces of the same structure—pieces which had been scattered here and there, some even as far as the Arch of Severus—and to put them with the others. It is much to be hoped that further exploration in this vicinity may enable us to discover the former purpose of the building. Possibly it was the Temple of Minerva, which certain of the Mediæval writers mention as standing in about this position.

Yet another little understood monument is the Puteal Libonis. Middleton and others have asserted that a certain set of curved stones at the north-eastern corner of the Temple of Castor were the remains of this puteal, a supposition attributable to the blinding influence of theory, for it needed but a little observation to see that the stones in question could not form a circular base such as the puteal demanded, that they were not in situ, and that they had been taken from some ancient building and crudely hacked into their present shape. One or two of them have now been raised up on edge for the due edification of theorists, and the puteal no longer exists.

Many fragments of the arches of Fabius and of Tiberius have recently received the attention for which they have long waited in vain. In removing some of the earth near the Fabian arch an excellent female portrait head was found a few inches below the surface—striking evidence of the careless manner in which earlier excavations were carried out. But by far the most important discovery, and at the same time the clearest evidence of the incredible carelessness of the earlier excavators, was a metope and fragments of the cornice of the Basilica Æmilia. These had been built into the wall that supports the street on the northern side of the Forum. As the metope block is rather larger than a cubic metre the excavators must have seen it, and as it is splendidly decorated with a boucranion it is difficult to comprehend upon what system it was discarded. What treasures may not yet be found in this very modern wall? Fragments of the Basilica Julia have also been found, one of them from a window of the upper storey. As this is the first piece of the kind it is most important. Thus in these few weeks our knowledge of the architecture of the Forum has been increased in a noteworthy manner. All these varied facts might have been the common property of scholars long since had the work of past years been done by those who were equal to the task.

The question that is at present engaging the attention of the committee (composed of Senator Sacconi, Professor Lanciani, Signor Gatti and Dr. Huelsen), to whom Signor Boni refers his plans, is what had best be done about the honorary columns which formerly stood on the brick bases in front of the Basilica Julia. Signor Boni has found all the parts of one of these columns. The base on which it stood is shown by photographs taken at the time it was excavated. The pedestal only is lacking; it was similar to that on which the Column of Phocas stands. Is the pedestal to be restored in brick and the column raised upon it or shall the column be left on the ground? Some advise the erection of the column on the brick base, leaving out the pedestal entirely. Their contention is not easy to understand. If one has a statue of which the head remains while the neck is lost, one does not set the head on the shoulders, but makes a plaster neck, or inserts an iron pin to support the head. So, too, if one has an inscription of which the central portion is lost, one does not set the two ends in juxtaposition, but separates them by so much space as the lost portion occupied. Or else the head is simply left to lie by the torso, and the two fragments of inscription wherever they are least likely to be injured. What reason is there for not treating the column in the same way? Here are brick base and column. Why not build a pedestal with the proportions of that of the Column of Phocas, a monument of exactly the same class and period as the column under consideration? The brick base would deceive no one and would serve to put the column in its proper relation to the neighbouring monument.

To no other buildings in the Forum pertains a deeper and more abiding interest than to the Rostra Vetera and the Temple of Cæsar. Interesting facts regarding both of these

monuments have just been brought to light. Almost all the base moulding and cornice of the Rostra have been found, and there is good evidence that an inscription of the *præfectus urbi*, Valentinus (parts of which have long been known), formerly decorated the fifth century addition to the northern end of the Rostra. At the Temple of Cæsar the earth—which, *mirabile dictu*, had never been removed from the space between the hemicycle in the front wall and the (probably) third century wall that stands before the hemicycle—has now been taken away and a very important discovery made. Suetonius mentions that after Cæsar's death a column was set up *parenti patriæ*, and other literary evidence gives reason to believe that it stood on the spot where Cæsar's body had been burnt. In front of the hemicycle, just where one would naturally look for traces of this column, the remains of a base such as would be used to support a column have been found, resting on a beautifully laid pavement that seems to be the very pavement of the Forum which Cæsar himself must have trod. It was a very stirring sensation that one experienced, standing on those stones the day they came to light—those stones beneath which Imperial Cæsar's ashes still seemed to glow—mine the first Anglo-Saxon feet that had ever trod so close to the presence of the greatest Roman of them all.

This is what has been accomplished. Much still remains to be done, and we must devoutly trust that Signor Baccelli will continue on the course he has chosen, and not allow himself to be influenced by the jealousies and rivalries that ruin the efficiency of the Archæological Department. Even Greece does not offer such a spectacle of wasted money, misdirected effort and incapacity as is to be seen in the management of the Italian Department of Fine Art.

THE COST OF LIGHTHOUSE CONSTRUCTION.

THE following letter to Mr. W. F. G. Anderson, of Glasgow, has been sent by Mr. D. A. Stevenson, engineer to the Commissioners of the Northern Lighthouses :—

Edinburgh : January 3, 1899.

Dear Sir,—In your address to the Glasgow Chamber of Commerce you quote from the Royal Commission report of 1861 to show that lighthouses in Scotland have been more expensive to erect than elsewhere, and in which it is stated that the Bishop cost in construction less than half what was expended on Skerryvore. In previous letters to you I explained the matter, asked you to publish the facts and gave you, as desired, time to make inquiries which, I venture to suggest, would have been better made before than after you spoke.

Most people will agree with me that the only fair and business way to compare the cost of two works, be they lighthouses, harbours, or ships, is to take into account all that has been spent on them in each case. Now in Mr. Douglass's account of the Bishop Rock (Proceedings of Inst. C.E.), which I sent you, he says, "The cost of the works executed at this station from time to time" is "111,900*l*.," and what has been spent at Skerryvore is 83,000*l*., which, by the way, includes the cost of the shore station and other matters not included in the cost of the Bishop; consequently the Bishop has cost the Mercantile Marine Fund more than Skerryvore, not less. You say you are informed that the recent additional expenditure of 64,889*l*., about double what the original stone tower cost, was incurred at the Bishop principally for the purpose of raising the height of the light and improving it. That is not so. Mr. Douglass clearly states in his paper that the tower as constructed was too small and too weak to stand the seas to which it was exposed, and had to be strengthened and ultimately practically rebuilt. You do not imagine surely that the Trinity House would have spent 64,889*l*. merely to raise and improve the light. If they had done so it would have been a piece of gross extravagance, and those who pay light dues would have had good ground for complaint. But even if it were so, Why was the Bishop Tower not made high enough at first?—the Skerryvore has not required to be heightened.

I am aware that you did not originate the comparison between the Skerryvore and the Bishop, but you quoted the report of the Commission that did so without stating—and this is what I complain of—what has occurred since that report, although I am quite ready to admit that you did so in ignorance. Of course, the Royal Commissioners who reported in 1861 were unaware and did not foresee that the Bishop Tower, only completed in 1858, at a cost of 34,559*l*., was too weak and too small for its work, and that over 64,889*l*. in addition would require to be spent in strengthening it within the next twenty years, bringing up the cost of the work above that of Skerryvore. If they could have foreseen it, the Royal Commissioners would then have understood what was the reason for the difference of cost, which appeared to them so remarkable, and they would have drawn a comparison favourable to the Skerryvore instead of the reverse, cautiously stated though it was.

Driven from this position, you now propose to enter on new comparisons to support the case you are trying to establish, that the Scottish lighthouses are expensive, pitting the Wolf against Skerryvore and the new Eddystone against Dhu Heartach; but the costs that have been supplied to you for these towers are not made up on the same basis, and have misled you, as the correct figures show that the cost of these towers, and indeed of all our Scottish lighthouses, will compare favourably with similar works in any other country.

I regret being drawn into this correspondence, as I have the greatest respect for the ability of the late Mr. Walker, the engineer of the Bishop Rock Tower, and no one knows better than I do the difficulties to be overcome in connection with the construction of rock lighthouse towers. I desire to criticise no one's work, but I regard it as my duty to see that justice is done to my predecessors in office.

I am glad you recognise the difficulty of making a fair comparison between the cost of lighthouses where the position and circumstances are not and cannot be exactly similar in any two cases; and such comparisons as have been attempted, taking the cost per cubic foot of masonry or per candle-power of light, are delusive.

As on this point of the cost of our lighthouses, so on practically every point in your address in which you adversely criticise the action of the Northern Lighthouse Board, you are misinformed or not fully informed; and I again invite you to study the statement submitted to the Mercantile Marine Fund committee by the Commissioners of Northern Lighthouses in 1895, which would put you right on many points.

As you are evidently reluctant to comply with my request and publish the facts as to the Bishop, I am sending this letter to the press.—Yours faithfully,

(Signed) D. A. STEVENSON.

Mr. W. F. G. Anderson, Glasgow.

In reply, Mr. Anderson has sent the following letter to Mr. Stevenson :—

Glasgow : January 4, 1899.

Dear Sir,—I have your letter of 3rd inst., which I observe you have sent to the press, but as you have withheld the rest of the correspondence I am supplying the omission. I do not propose to prolong the correspondence, as no good end would be served by so doing, but as you now take exception in a general way to other statements made by me before the Chamber of Commerce, and refer me to the statement prepared by the Commissioners as a reply to the evidence which was given before Mr. Courtney's committee, you will permit me to say that I prefer to take it in conjunction with the evidence (particularly of such witnesses as Sir George Nares, Sheriff Guthrie Smith and yourself) rather than in substitution for such evidence. I was quite prepared to do justice to any well-grounded objections on your part at the first meeting of the Chamber, but you have now rendered further action on my part unnecessary. It was only yesterday that I obtained from the Trinity House the information for which I applied on receipt of your first letter, copy of which I annex.—Yours faithfully, (Signed) W. F. G. ANDERSON.

Mr. D. A. Stevenson.

Bishop Rock.

The first lighthouse erected on this site was an open structure of wrought and cast-iron; but when the tower was ready for the reception of the lantern the building was completely carried away during a heavy storm on February 5, 1850. A granite lighthouse was then commenced to replace the iron one, and this structure was lighted in 1858. In 1874, however, the tower had, owing to the tremendous seas to which it was exposed, to be strengthened from top to bottom by iron ties, and in 1881 the Trinity House determined to again strengthen and improve the structure by adding an outer casing of masonry up to the level of the service-room floor, and to increase the height of the building so that the focal plane of the new and most powerful light to be provided should be at an elevation of 146 feet, or 36 feet above that of the former one, and its nautical range be extended from 16 miles to 18¼ miles. This work was commenced in 1883 and completed in 1887. Deducting the cost of the first (iron) lighthouse erected on the Bishop Rock, viz. 12,500*l*., a sum of about 99,450*l*. in all has thus been spent on the present tower. This large expenditure has been due to the fact that the site is one of, if not actually, the most exposed of any rock lighthouse on the coast of the British Isles, and the light, from its position, one of the mose important to shipping.

The following are copies of the previous letters on the subject that passed between Mr. Anderson and Mr. Stevenson :—

Edinburgh : December 17, 1898.

Dear Sir,—I have to-day read your remarks made at the meeting of the Chamber of Commerce, Glasgow, as reported in the *North British Daily Mail* of the 13th current, in which you

submit a contrast of the cost of Skerryvore Lighthouse and the Bishop Rock Lighthouse quoted from a Royal Commission report which sat in 1861, with the view of showing that Skerryvore was an unnecessarily expensive work. Will you allow me to put you right as to a matter of fact, and ask you to give the correct facts equal publicity to your previous statement? The Bishop Rock Lighthouse was erected in 1858, and cost 34,559*l.*; but it had to be strengthened in 1874, and again in 1887 it had to be further strengthened with a new granite casing and other improvements, which cost 64,889*l.*, or, together, 99,448*l.* I may also mention that a cast-iron lighthouse, costing 12,500*l.*, was, in the first instance, erected on the site of this lighthouse, but it was entirely swept away by the force of the sea. You will thus see that 111,948*l.* has been spent on the Bishop Rock light, and on Skerryvore only 83,126*l.* Comment is unnecessary. There are various other points in your address as reported on which you are misinformed with regard to Vee Skerries, Flannan Islands, the erection of lighthouses with tenders, &c.; but I do not propose to trouble you with these. I think you cannot have seen the statement by the Commissioners of Northern Lighthouses submitted to the Mercantile Fund committee, which puts various other lighthouse matters you refer to correctly.—Yours faithfully,

(Signed) D. A. STEVENSON.

Mr. W. F. G. Anderson, Glasgow.

Glasgow: December 19, 1898.

Dear Sir,—I have your letter of 17th inst. in which you draw my attention to the large amount that was spent in strengthening the Bishop Rock Lighthouse on two occasions. I am inquiring into this matter, and after I obtain the information which I require I will communicate with you again on the subject.—Yours faithfully,

(Signed) W. F. G. ANDERSON.

Mr. D. A. Stevenson, Edinburgh.

Edinburgh: December 21, 1898.

Dear Sir,—I have your letter of the 19th current, and send you herewith a copy of the description of the Bishop Rock Lighthouse which will give you the information you desire. It is, you will readily acknowledge, to be regretted that statements are made in public in reference to the Northern Lighthouse Board which cannot be substantiated and might have easily been verified. Kindly return the enclosed when your purpose has been served.—Yours faithfully,

(Signed) D. A. STEVENSON.

Mr. W. F. G. Anderson.

Glasgow: December 23, 1898.

Dear Sir,—I have your letter of 21st inst., covering a copy of Mr. Douglass's description of the Bishop Rock Lighthouse, which I have perused and now return with thanks. Whilst I have found the paper interesting it does not exactly supply the particular information which I desiderate in connection with the question of the relative cost of the Bishop Rock and Skerryvore lighthouses. It appears to me that the relative situation and exposure of the two lighthouses require to be taken into account, and I should like to know whether the strengthening required for the Bishop Rock light arose from defective design or workmanship or from other causes that could not reasonably have been foreseen or provided for. I observe from Mr. Douglass's paper that, in his opinion, if the usual test of cost for such structures be applied to the Bishop Rock light, as it now stands (from which I infer that he includes the original cost as well as the expense of strengthening), it will compare favourably with other sea structures, and if the value be estimated from a nautical point of view it will be found to be lower in cost than any other first-class sea lighthouse.—Yours truly,

(Signed) W. F. G. ANDERSON.

Mr. D. A. Stevenson.

Glasgow: December 27, 1898.

Dear Sir,—I have now obtained some further information with reference to the Bishop Rock Lighthouse, from which it would appear to be scarcely fair to include, as you suggested, the outlay on the iron structure which was washed away, or the outlay on the improvement on the stone tower, 1882-87, since this was effected to give greater elevation and more space for a light of higher power. The strengthening which you also referred to appears to have been a small matter. You are, of course, aware that the comparison between the Bishop Rock and Skerryvore lighthouses did not originate with myself, but was made by the members of the Royal Commission of 1861, and that although I limited my extract from the report to the observations regarding three lighthouses, the Royal Commissioners made a much more comprehensive comparison, embracing English, Scotch, Irish and foreign lights generally, which, so far as the question of cost was concerned, was not in favour of the Scotch lights. As you have taken exception to the particular comparison which I quoted, it has been suggested to me that the cost of the Wolf Rock (62,726*l.*) might be compared with Skerryvore (83,126*l.*). The exposure of the Wolf Rock can, I think, be fairly compared with that of Skerryvore, and it contains more masonry. Similarly, the new Eddystone cost 59,255*l.*, as against 72,584*l.* at Dhu Heartach. I find that the Wolf Rock and Eddystone cost respectively 1*l.* 1*s.* 3*d.* and 18*s.* 2*d.* per cubic foot, as compared with 1*l.* 4*s.* 7¾*d.* for Skerryvore and 1*l.* 14*s.* 6*d.* for Dhu Heartach. I recognise the difficulty of a fair comparison between the cost of lighthouses where the position and circumstances are not exactly similar, and for this reason I attached a secondary importance to this question as compared with the other matters dealt with in the statement which I made before the Chamber of Commerce.—Yours faithfully, (Signed) W. F. G. ANDERSON.

Mr. D. A. Stevenson.

VENTILATION OF SCHOOLS.

AT the Teachers' Conference on Saturday a paper was read by Dr. A. Newsholme, examiner in State and preventive medicine to the Universities of London and Oxford, on "The Essential Conditions of Healthy Life in Schools." Dr. Newsholme confined himself to the structural and physical side of the question, the object being to explain and elucidate such requirements as would be likely to be enforced in secondary schools under a Secondary Education Act, Schedule VII. of the Elementary Education Code being taken as a guide, though many of its requirements were severely criticised. The main problem of school hygiene was that of ventilation. In connection with this cleanliness was essential. Every part of a school should be washable, and wet cleansing instead of dry should always be practised. Dust was the great enemy of health, and infectious dust was very apt to be spread in schools. Carnelley's results showing how the micro-organisms in school air increased with dirtiness of schools and of scholars were quoted. Natural ventilation by windows and other openings could only suffice in summer, in view of the dense aggregation of children in school. In winter the incoming air must be warmed, a point which he emphasised. This implied in large schools a mechanical system of ventilation, propulsion and aspiration of air being secured by special appliances. The Education Department still allowed the deadly system of "direct radiation" without stipulating for conjoined admission of fresh air. Such warmed air was necessarily expensive, but it amply repaid in improved health of teachers and scholars. Carnelley's researches had shown that the air in mechanically ventilated schools was greatly superior to that in schools where trust was placed in natural ventilation along with hot pipes or along with open fires, as still recommended by the Education Department. The desiderata as to school desks and seats were next discussed, the dual and larger desks being condemned. In elementary schools classes were allowed of too large a size, to the detriment of all concerned, worse teaching, impairment of health of teachers by overstrain, and of scholars by too close congregation. No class should exceed fifty in number, preferably forty. Single desks would go far to insure this; and they should hear less of infectious disease spread by school life.

GENERAL.

Mr. Harry Bates, A.R.A., sustained while on his autumn holidays a severe strain of the heart, which has necessitated complete rest for a time. His illness has caused some anxiety to his numerous friends, but he is now making satisfactory progress towards recovery, and his medical attendants give encouraging reports of his condition.

The Salon Exhibition of 1898, which was held in the Champ de Mars, has entailed a loss of 65,000 francs for the Society of French Artists.

Professor Aitchison's Lectures at the Royal Academy will commence on the 31st inst. The subject of the course will be "Greek Architecture." The first lecture of Mr. A. S. Murray's course will be delivered on February 20. The subjects to be treated are the "Niobides in Florence," the "Nereids in the British Museum," "Victories," "Bronze Charioteer at Delphi," "Chariot Groups," "Neo-Attic Sculpture." Sir W. B. Richmond's course began on Monday last.

The Morley School Board have adopted plans by Mr. T. A. Buttery, of Morley, for the new Board schools, which will be erected at a cost of 7,636*l.*

Mr. L. F. Vernon-Harcourt, C.E., will read a paper on Wednesday at the Society of Arts on "Canals and Inland Navigation in the United Kingdom." Sir E. Leader Williams will preside.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

COMPETITION OPEN.

BRADFORD.—April 14.—Designs will be invited for the erection of the Bradford Corporation Cartwright Memorial Hall, at a cost of 38,000*l.* Three prizes will be offered, value 150*l.*, 100*l.* and 50*l.* respectively. Particulars will be found in another column.

CONTRACTS OPEN.

BAKEWELL.—Jan. 28.—For erection of infirmary, female tramp wards, porter's lodge and the alteration of the present receiving wards at the workhouse. Mr. E. M. Longsdon, architect, Town Hall, Bakewell.

BARROW-IN-FURNESS.—Jan. 20.—For wiring the Free Library. Specification, &c., from the Town Clerk.

BAWTRY.—For alterations and repairs to Holland House, Mission. Mr. Joseph F. Walsh, architect, Lancashire and Yorkshire Bank Chambers, Halifax.

BELFAST.—Jan. 16.—For rebuilding the Crown licensed premises, Shankill Road. Mr. W. J. Moore, architect, Whitehall Buildings, Ann Street, Belfast.

BERWICK-UPON-TWEED.—Jan. 31.—For erection of lock-up and police station in Church Street. Mr. R. Burns Dick, architect, 55 Northumberland Street, Newcastle-upon-Tyne.

BLACKPOOL.—Jan. 25.—For alterations and additions to station buildings at Central Station, Blackpool, for the Lancashire and Yorkshire and London and North-Western Joint Railways. Mr. C. W. Bayley, secretary, Hunt's Bank, Manchester.

BRIDLINGTON QUAY.—For erection of four terrace houses. Messrs. Chorley, Connon & Chorley, architects, 15 Park Row, Leeds.

BRIGHTON.—Jan. 17.—For conversion of an existing building at the Brighton Workhouse into apartments for the accommodation of a superintendent nurse. Mr. H. T. Reed, Parochial Offices, Prince's Street.

BURNLEY.—Jan. 16.—For rebuilding the Yorkshire Hotel, Gunsmith Lane. Mr. Robert Neill, architect, 9 Grimshaw Street, Burnley.

BURTON-UPON-TRENT.—Feb. 1.—For widening the bridge crossing the Midland Railway, Horninglow Street, and alterations to existing buildings adjoining thereto. Mr. George T. Lynam, borough engineer.

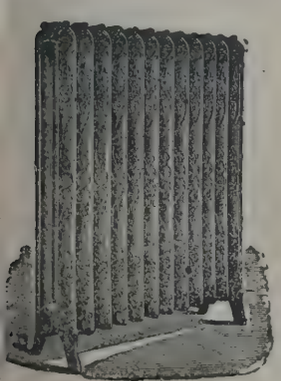
CARLISLE.—For erection of two houses at Brampton. Mr. J. Studholme Thompson, solicitor, Bank Street, Carlisle.

CHELTENHAM.—Jan. 23.—For reconstruction of retaining wall at No. 3 reservoir at Hewletts. Mr. E. T. Brydges, town clerk, Municipal Offices, Cheltenham.

CORNWALL.—Jan. 19.—For additions to the Churchtown school, Paul. Mr. William Curnow, Urban District Council, Paul.

DEVON.—Jan. 18.—For erection of a classroom and offices at the Eastdown Board schools. Mr. James Mayne, clerk, Eastdown, Barnstaple.

EXMOUTH.—For erection of four houses and shops opposite the railway station and Strand; erection of six semi-detached villas in Montpellier Road; putting new roof and making alterations and additions to 4 The Beacon. Mr. Philip Kerley, architect, Exmouth (opposite the railway station).



FAREHAM.—Jan. 16.—For construction of concrete foundations, erection of brick, steel and concrete superstructure of new infirmary wards, sanitary blocks, boiler-house, tall chimney shaft, &c., at County Lunatic Asylum, Knowle. Mr. W. J. Taylor, county surveyor, the Castle, Winchester.

FELIXSTOWE.—For erection of a villa. Mr. G. W. Thompson, architect, Granville House, Arundel Street, London, W.C.

GOOLE.—Jan. 18.—For erection of a foreman's cottage, Creyke's Siding, for Messrs. W. Smith & Co. Mr. H. B. Thorp, architect, Goole.

GUIDE BRIDGE.—Jan. 23.—For construction of refreshment rooms at Guide Bridge station, for the Great Central Railway Company. Mr. O. S. Holt, secretary, London Road Station, Manchester.

HANDSWORTH.—Jan. 17.—For enclosing and laying-out the new burial-ground, including making roads, &c., and

BERRY, CAMPBELL & CO.

WARMING & VENTILATING ENGINEERS,

62 WATLING STREET, QUEEN VICTORIA STREET.

Heating by Hot Water, or High or Low Pressure Steam, expeditiously carried out on the most approved principles. Special attention given to Private Residences.

ESTIMATES FREE.

erecting a chapel and boundary walls, &c. Mr. Edmund Winder, jun., surveyor, Corn Exchange Chambers, Wharf Street, Sheffield.

HUDDERSFIELD.—Jan. 18.—For erection of twelve dwelling-houses at Calmlands, Meltham. Mr. J. Berry, architect, 9 Queen Street, Huddersfield.

IRELAND.—Jan. 18.—For erection of business premises in High Street, Enniskillen. Mr. Thomas Elliott, architect, 37 Darling Street, Enniskillen.

IRELAND.—For alterations to business premises, Queenstown. Mr. Arthur Hill, architect, 22 George's Street, Cork.

ISLE OF THANET.—Jan. 25.—For erection of cottage home buildings at Manstone. Mr. Leonard Grant, architect, High Street, Sittingbourne.

KEIGHLEY.—Jan. 19.—For erection of two houses and shops in Cavendish Street. Mr. Geo. H. Knowles, architect, Burlington Chambers, Keighley.

LEEDS.—For erection of two pairs of semi-detached houses in North Grange Road, Headingley. Messrs. Kendall & Bakes, architects, Calverley Chambers, Victoria Square, Leeds.

LEEDS.—Jan. 17.—For alterations and additions to the poor-law offices, East Parade. Mr. T. Butler Wilson, architect, 12 East Parade, Leeds.

LEEDS.—Jan. 17.—For pulling-down and rebuilding boundary walls in Old Park Road, Roundhay, for the purpose of widening the road. Mr. E. J. Silcock, 10 Park Row, Leeds.

LEEDS.—Jan. 21.—For erection of a shoe factory in Hudson Road, Burmantofts. Messrs. Stephen Ernest Smith & John Tweedale, 12 South Parade, Leeds.

LEEDS.—Jan. 28.—For additions and alteration of Messrs. Wm. Wms. Brown & Co.'s old bank premises in Commercial Street into shops and suites of offices; alteration of shop premises and the Jubilee Hotel in Victoria Square; erection of printing warehouse, Cookridge Street; erection of shop premises and bakery, North Street; and settling tanks, Sheepscar Street. Mr. Thomas Winn, architect, 92 Albion Street, Leeds.

LEEDS.—Feb. 6.—For alteration and renovation of the public baths in Cookridge Street. Messrs. Walter Hanstock & Son, architects, Branch Road, Batley.

LIVERPOOL.—Jan. 17.—For erection of a police-station, dwelling-houses, &c., at Huyton. Mr. Henry Littler, architect, County Offices, Preston.

LITTLE ILFORD.—Jan. 25.—For erection of school buildings, out-buildings, caretaker's cottage, &c., in Bessborough Road. Mr. S. Jackson, architect, 65 Fenchurch Street, E.C.

LONDONDERRY.—Jan. 17.—For erection of six alms cottages (with the alternative of four) at Carrigans Lane. Mr. R. Eccles Buchanan, architect, 33 Shipquay Street, Londonderry.

NEWTOWN CUNNINGHAM.—Jan. 23.—For erection of teacher's residence at Newtown Cunningham, co. Donegal. Mr. M. A. Robinson, architect, Richmond Street, Londonderry.

NORTHALLERTON.—Jan. 31.—For erection of bathroom, bath and hot and cold water supply at the workhouse, Northallerton. Messrs. Fairbank & Son, 13 Lendal, York.

OLDHAM.—Jan. 21.—For erection of additional business premises at Delph, for the Delph Industrial Co-operative Society, Limited. Plans and specifications may be seen and bills of quantities obtained at the Society's office.

PRESTON.—Jan. 17.—For erection of a police-station, dwelling-houses, &c., at Huyton. Mr. Henry Littler, architect, County Offices, Preston.

RAWTENSTALL.—Jan. 23.—For erection of five cottages in Annie Street. Mr. F. J. Hobson, architect, King Street, Rawtenstall.

RIPPONDEN.—Jan. 31.—For erection of a fireproof mill adjoining the present mills at Ripponden. Messrs. Richard Horsfall & Son, architects, 22A Commercial Street, Halifax.

RISHTON.—Jan. 16.—For work to be executed at the Conservative Club. Messrs. J. C. Howard Sandback & J. Parker, architects, 15 Richmond Terrace, Blackburn.

ROCHDALE.—Jan. 17.—For erection of buildings for electricity works. Mr. J. Leach, town clerk, Town Hall, Rochdale.

ROCHESTER.—Jan. 18.—For erection of fire station at Station Road, Strood. Mr. W. Banks, city surveyor, Guildhall, Rochester.

ROTHERHAM.—Jan. 21.—For the erection of a villa residence at Greasborough, near Rotherham. Mr. J. Platts, architect, Old Bank Buildings, Rotherham.

RUGBY.—Feb. 15.—For erection of public offices in High Street. Mr. D. G. Macdonald, surveyor.

SCOTLAND.—Jan. 21.—For erection of court-house and police-station at Dunoon. Mr. Wm. Fraser, architect, Burgh Buildings, Dunoon.

MAW & CO. will forward their Pattern Books, or Special Designs, with Estimates for every kind of Wall and Floor Tiling, on application. Patterns can also be seen and particulars obtained at the Showrooms of their appointed Agents,

Messrs. W. B. SIMPSON & SONS, 99 St. Martin's Lane, W.C.

SHILLINGFORD.—Jan. 18.—For erection of a residence. Mr. Saml. Johns, architect, Wallingford.

SOUTHMINSTER.—Jan. 17.—For erection of Railway Hotel at Southminster, Essex. Mr. P. M. Beaumont, architect, Maldon.

TUNBRIDGE WELLS.—Jan. 26.—For erection of a chimney shaft at the workhouse near Penbury. Mr. Frank Wm. Stone, clerk, 23 Church Road, Tunbridge Wells.

WAKEFIELD.—Jan. 17.—For erection of cottage homes in connection with the acute hospital now in course of completion. Mr. J. Vickers Edwards, County Hall, Wakefield.

WALES.—Jan. 20.—For erection of thirty-five cottages, Cwmaman, Aberdare. Mr. T. Roderick, architect, Clifton Street, Aberdare.

WALES.—Jan. 23.—For erection of an intermediate school and hostel at Hengoed to accommodate eighty girls. Messrs. James & Morgan, architects, Charles Street Chambers, Cardiff.

WALES.—Jan. 25.—For additions and alterations to the Imperial Hotel, Porth. Mr. A. O. Evans, architect, Pontypridd.

WARWICK.—Jan. 19.—For erection of bathroom and lavatories at the workhouse. Mr. Francis P. Trepess, architect, 8 Jury Street, Warwick.

WHITBY.—Jan. 21.—For alterations to Talbot Hotel. Mr. John J. Milligan, architect, 77 Baxtergate, Whitby.

WIMBLEDON.—Feb. 13.—For erection of isolation hospital, to include three ward blocks, administrative block, cottage, receiving and discharging block, laundry and disinfecting station and mortuary, on site off Gap Road. Mr. C. H. Cooper, surveyor, Council Offices, Broadway, Wimbledon.

WINCHESTER.—Jan. 18.—For construction of strong-rooms in county offices and other small works. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

WINGATE.—Jan. 28.—For erection of a shop near Trimdon Station. Apply to the Secretary.

WOMBOURN.—Jan. 17.—For erection of a superintendent engineer's house at the Bratch waterworks. Mr. John D. Wassell, clerk, District Council Offices, Town Hall, Bilston.

A SCHOOL attached to the Methodist New Connexion a Fartown, Pudsey, was opened on Saturday last. The cost of erection was about 2,200*l.*

TRADE NOTES.

THE new Board schools, Conisborough, near Rotherham, are being warmed and ventilated by means of Shorland's patent Manchester grates.

OWING to the expiration of their lease, Messrs. John Jones & Sons, of the Art Metal Works, Walker's Croft, Manchester, have removed their foundry and offices to New Wakefield Street, Oxford Street, Manchester.

MR. GEORGE A. LANSDOWN, architect, of 5 and 7 Warwick Street, Charing Cross, London, S.W., informs us that the London County Council having purchased his present premises, he is removing to No. 9 Regent Street, Waterloo Place, S.W.

WE have received from Messrs. Whittaker & Co., Paternoster Square, E.C., a catalogue of useful handbooks for civil, mechanical and electrical engineers, and for students in science, technology and art. The works enumerated embrace an extensive field of subjects, and many of them are by authorities of wide reputation.

MESSRS. JERE KAYE & CO., timber merchants, Huddersfield, notify us that in order to more efficiently cope with their increasing business, they have opened an office at Queen's Dock, Hull, which, with a yard at Victoria Basin, will be under the charge of Mr. W. H. Boden, who has represented them in Hull for several years.

THE heating of the new Municipal Buildings, Douglas, Isle of Man, is to be effected by means of Spencer's patent "Ventilo" radiators, which have been fitted in many parts of the country in churches, chapels, schools, theatres and public buildings, and have been found to give highly satisfactory results. The patentee and sole maker is Mr. W. F. Spencer, Crossbank Works, Oldham, and 145 Queen Victoria Street, London, E.C.

THE fire-extinguishing arrangements at St. James's Hall, Piccadilly, have recently been thoroughly overhauled, and the water-supply being of insufficient pressure to enable jets to be thrown into the roof and upper galleries, Messrs. Merryweather have just fitted one of their patent "Hatfield" pumps, driven by an electro-motor. This pump is connected to the hydrant system, and enables jets to be thrown 40 feet above the roof at any time. The pump is placed in the basement and a switch placed by each hydrant enables it to be started immediately from any part of the building.

THE High Church, Paisley, having recently undergone extensive alterations and improvements from the designs of Mr. John Hutchison, architect, Glasgow, every care has been taken to make the ventilation efficient, Cousland's Improved Climax patent direct acting invisible roof ventilators and natural exhaust ventilators being used, supplied by the Climax Ventilating and Heating Company, 93 Hope Street, Glasgow.

MESSRS. ROBERT W. MANN & SON, auctioneers, surveyors and estate agents, inform us that, owing to the early expiration of the lease of 32 Lowndes Street, the business of Messrs. Robert W. Mann, Son & Ransome, auctioneers and surveyors, has been amalgamated with that of their other office at 12 Lower Grosvenor Place (near Victoria Station), and transferred to that place, which will be henceforth their only address.

VARIETIES.

THE new Baptist church erected in Wellington Road, Eccles, was opened for service on Sunday. The cost of the church, inclusive of the Sunday schools, opened some few weeks ago, is 4,000*l.*

THE Urban District Council of Handsworth have applied to the Local Government Board for sanction to borrow 17,500*l.* for works of sewerage, 15,030*l.* for the purpose of their depôt in Queen's Head Lane, 4,000*l.* for works of street improvement, 2,362*l.* for the purpose of the Victoria Park, 2,200*l.* for the erection of a fire-station, and 770*l.* for their refuse-destructor in Queen's Head Lane. An inquiry into the subject matters of the application is to be held at the Public Buildings.

A NEW Wesleyan Sunday school was opened at Wortley on Saturday last, which is to replace the old one, which has become inadequate to the requirements. The designs were

prepared by Mr. Wilkinson, of Park Square, and the contracts were let for about 900*l.* Additional classrooms have been provided, and the infants' department has been divided into three such apartments.

THE Dover Corporation, who already own the local waterworks, electric tramways, bathing establishments and machines, &c., at their meeting on Tuesday afternoon had before them a proposal to purchase the local gas and electric light undertakings. The proposal was adjourned for further particulars.

THE interesting old parish church of Coddenham, Suffolk, which is situated in an historical part of East Anglia, has just been enriched by the addition of an elaborately-carved reredos, the gift of the vicar and friends. The panels are carvings in high relief decorated with gold and colour, and represent on the left the Three Marys at the Tomb, and on the right the Descent of Our Lord from the Cross. Iron-hinged brackets of elaborate design, with curtains hanging therefrom, are fixed on either side of the reredos.

THE new lecture-hall and school buildings in connection with Wesley chapel, Birkenhead, were opened on Thursday, the 4th inst. Accommodation is provided for over 700 children, the cost being about 3,000*l.* The contract has been successfully carried out by Mr. James Merritt from the designs and under the superintendence of Mr. T. W. Cubbon, architect, of Birkenhead.

THE entrance to the lower chamber in the central lobby of the Houses of Parliament is occupied with scaffolding, and a number of workmen are engaged in placing an elaborate mosaic representing St. David in the niche over the doorway. The mosaic is to be a companion work to that depicting St. George over the entrance to the House of Lords, and it is intended to place mosaics representing the patron saints of Scotland and Ireland in the corresponding spaces over the doorways leading to St. Stephen's Hall and to the Commons' dining-room and committee-rooms. The St. David mosaic will be in place before the opening of Parliament.

A MEETING of the Liverpool Architectural Society was held on Monday evening in the rooms of the Reference Library, William Brown Street, when the members, numbering about thirty, were permitted to inspect a selection of the most valuable literature in the department of architecture which the institution possesses. The formal business of the meeting was brought to an early close by Mr. W. E. Willink, the Society's president, in order that the opportunity to examine the volumes displayed by the chief librarian, Mr. Peter Cowell, should be taken advantage of to the fullest possible extent. Much satisfaction was expressed at the pleasurable and profitable results of the meeting, which terminated with the thanks of the Society to the libraries committee and the chief librarian.

THE directors of the Natclough Fustian Manufacturing Society, Leeds, for the purpose of meeting the requirements of the County Council, have constructed two huge brickwork tanks for the purpose of filtering dye-water before being turned into the river. On Monday one of the tanks had been filled for the purpose of testing the filtering process. The tank measured 26 feet by 19 feet, and there were 10 feet of water in it, when, without the slightest warning, the outer wall, which runs alongside the river, was carried bodily out. One of the workmen, who was on the wall, was carried with it, but, strange to say, he escaped without injury. Others had narrow escapes. The damage is put down at 120*l.*

SHORTLY after two o'clock on Sunday afternoon a large iron bridge spanning several lines of railway at the north end of Crewe, on the London and North-Western system, suddenly collapsed, through a number of huge pillars giving way, and fell with a great crash on to the lines below. Some waggons standing near were smashed and derailed. The permanent way was cut up and a portion of the main line platform was wrecked. Many signals were completely cut through and the signalling arrangements disorganised. An engine and coach had a narrow escape of being crushed by the falling débris and several persons had wonderful escapes. Happily no one was injured. The bridge fell right across the main line to Chester and Holyhead, which was completely blocked, traffic having afterwards to be worked by a circuitous route. The bridge stood on massive iron pillars, and what caused their collapse is a mystery.

A NOVEL application of aerial tramways is now in use in connection with the works for the rebuilding of Vauxhall Bridge, the contractors for which, Messrs. Pethick, of Plymouth, have commissioned Mr. J. M. Henderson, of Aberdeen, to carry a suspension cableway right across the stream. This consists of a wire hawser 6½ inches in circumference, crossing the river with a span of about 920 feet and suspended from two uprights or masts, 77 feet high, on each bank. On this cable runs a trolley, from which can be hung a load of any desired character up to a weight of four tons. A stationary engine at the Westminster end hauls the trolley forwards and backwards

as required by means of an endless rope, and another rope enables the raising and lowering of the load also to be controlled from the bank. The apparatus is expected to be of great service, both in removing old material and in conveying new into position, and it has the additional advantage that, by its adoption, the free navigation of the river will be less interfered with than by the extensive stagings which the contractors would otherwise have been obliged to construct. That a very large amount of material will have to be transported may be judged from the fact that the new structure, which is to take five years to complete, will be much wider than the old one, and that the foundations of its piers, besides being proportionately larger, are to be carried down 22 feet below the present bottom of the river, instead of standing on the bed as was practically the case with the old bridge. Another interesting point is that it is to be built of concrete, a material which so far has not been much used for arches of such large span as the new Vauxhall Bridge will possess.

THE fabric of St. Luke's Church, Birmingham, although erected only a little over fifty years ago, has long been falling into decay, and considerable fear is entertained that the whole building may collapse. The attention of the city authorities has, says the *Liverpool Courier*, been directed to the matter, and as the result of a careful inspection of the structure it has been condemned as dangerous. Some few years ago the south wall showed signs of giving way, and that side of the church was propped up by stout pieces of timber. At the time this step was taken it was apparent that the fabric of the church as a whole was gradually giving way, and that the time was not far distant when it would become so dangerous and such a menace to public safety that it would have to be razed. Recently the process of decay has proceeded so rapidly that in the opinion of experts the condition of the building is such that further delay in either closing it for worship and pulling it down would be a source of danger. The internal columns are leaning to such an extent that they resemble so many towers of Pisa. They are falling outward, and as the external walls are giving way in the same direction there is the possibility of the north and south aisles tumbling down and the nave collapsing. The tower, too, appears none too safe. Indeed, owing to the perishing of the stone-work the top part of the turret depends entirely upon a few attenuated supports. The walls of the tower and the gable ends have perished to a remarkable extent both inside and out, and the east gable end of the south aisle has decayed to such a degree that there are holes in the walls through which the birds fly in and out. The other gables are in little, if any, better condition, and the circular window of stained-glass at the end of the chancel is only kept in position by a strong piece of wood which is nailed across it. The cause of the dilapidated state of the church is due to the soft and yielding nature of the stone employed in the erection of the fabric, and also the fact that although the walls are of considerable thickness they are simply "faced" with the stone, the interior being filled in with rubble. To look at the church one would think that it was built in the year 1481 instead of 1841. It was one of four built by the Birmingham Church Building Society in the forties. The others were St. Andrew's, St. Stephen's and St. Mark's. They were all built of the same kind of red sandstone, and all are in a sad state of decay. St. Luke's was erected at a cost of 3,700*l.*, the stone being given, and it has accommodation for 800 worshippers.

BUILDING AND BUILDERS.

IN our reference in last week's issue to the competition for Ardrossan and Saltcoats Hospital we gave Mr. Guest Luckett's address as at Glasgow, instead of Aylesbury. Twenty-eight sets of plans in all were sent in in this competition.

A BRICKLAYER'S labourer named Michael Kenny was awarded 120*l.* damages against Mr. William Cunliffe, builder and contractor, at Bolton, on Wednesday, for the loss of a finger through an accident.

TWO Burnley joiners, named Edward Lancaster and Richard Wright, were working at the new Greenwood Hotel, Horwich, when the scaffolding gave way owing to the wet weather, the gable falling with it. Both men were precipitated to the ground and internally injured. They lie at Bolton Infirmary in a serious condition.

THE tramway committee of Glasgow Corporation have approved of an agreement between the Corporation and the Renfrew County authorities for the erection of a new bridge over the Cart at the village of Cathcart. For the purpose of tramway extension the bridge is to be 50 feet wide, and to cost 8,000*l.* The expense is to be borne, one-half by the county authorities and the other half by the Tramways and Statute Labour Departments of the Corporation.

H. MUNZING. 199 UPPER THAMES ST., LONDON, E.C.

MR. SANG, civil engineer, Kirkcaldy, has completed his plans and drawings for the proposed new road to be made to connect Kirkcaldy and Pathhead. If the den is to be spanned by a four-arched viaduct, there is a difference of opinion in the Town Council as to the cost of the undertaking, some averring that 20,000*l.* would be expended, while the Council sanctioned the scheme on the understanding that it was not to exceed 14,000*l.*

AT a meeting of Dunoon and Kilmun School Board, held on Wednesday afternoon, the minutes of the Dunoon committee recommending the acceptance of the plans of Mr. Fraser, architect, for the extension of the Dunoon Grammar School, were carried by four votes to three. The carrying out of the plan will necessitate an outlay of between 3,000*l.* and 4,000*l.*, which will be expended in the erection of an additional storey over the central part of the school.

WORKMEN are now employed taking down St. John's Mission Church, Driffield, a temporary wooden structure erected for worship during the restoration of the parish church about twenty years ago, and ever since retained for that purpose. The last service was held on Sunday, when the building was crowded. The new church is to be of brick in the Norman style of architecture, and is to cost about 4,000*l.*

AT last week's meeting of the Old Kilpatrick School Board plans were submitted for the proposed school at Radnor Park. A selection was ordered to be sent to the treasurer to prepare an estimate of the cost, based on the specifications of the new school at Yoker in respect to material and quality of work. The Board also desired the estimate to show the probable cost of the building when completed and the probable cost of the part which it is intended to build at present, including boundary-walls, outhouses, playground and drainage, and the difference between certain systems of heating and ventilation.

THE Nottingham Board of Guardians have accepted the tender of Mr. Frederick Evans, Old Basford, of 158,000*l.*, for the erection of a new workhouse at Bagthorpe, subject to the contract being completed in three years. The lowest of the tenders originally sent in was 274,500*l.*, which far exceeded the estimates of the Board's advisers, whilst the expenditure sanctioned by the Local Government Board only amounted to 217,000*l.* Accordingly, the Guardians called in Mr. W. H. Ward, of Birmingham, their consulting architect, who suggested modifications of the scheme, whereby, without reducing the accommodation or sacrificing any material feature of the plans, a saving of at least 100,000*l.* would be effected, and it is on the basis of Mr. Ward's suggestions that the new tender has been accepted.

THE ordinary meeting of the Colne School Board was held on Monday evening, when a protracted discussion took place on a recommendation from the building and sites committee that the Board should purchase or obtain on lease 600 square yards of land for a new school at Black Lane Ends, where the Education Department have ordered the Board to provide accommodation owing to the closing of the Wesleyan Adventure school. The minute, however, was not confirmed. Another recommendation of the same committee, that a site be procured in Knotts Lane, in the west end of the town, where there is a lack of accommodation, also provoked much discussion, but was eventually adopted.

AN inquiry has been held at Castleton in regard to the application of the local authority for sanction to borrow 3,000*l.* for public improvements. Evidence was given in support of the application by Mr. R. B. Wallis, the clerk to the Council, Mr. Webster, the surveyor, and Mr. Thomas Holt, chairman. It was pointed out that the money was required for the provision of a new fire station, stables, cartsheds, dépôt and caretaker's house, all to be established in John Street, Castleton. Plans had been submitted for a mortuary, but this was only an afterthought, and if the Local Government Board did not press for the provision of one the District Council would drop the project. There was no necessity for a mortuary, it was urged, as the Council already had accommodation in another part of the district. They desired to put up substantial buildings, and to concentrate their offices rather than have them scattered about the district, as at present. No opposition was raised to the application, and after the inspector had finished taking evidence, he visited the site for the proposed buildings.

PROGRESS is being made in the erection of the new Presbyterian church and school hall at the corner formed by Harehills Avenue and Avenue Hill, Leeds. The hall has, in fact, already been completed and formally opened. It has cost 1,800*l.*, is built of pitch-faced stone lined with brick, with a pointed red-tiled roof to conform with the church to be erected in the near future on the immediately adjoining land. The dimensions of the hall are 43 feet by 26 feet 6 inches, and there is seating accommodation for about 250 people. The roof is timbered and the walls finished in plaster with a panelled wood dado up.

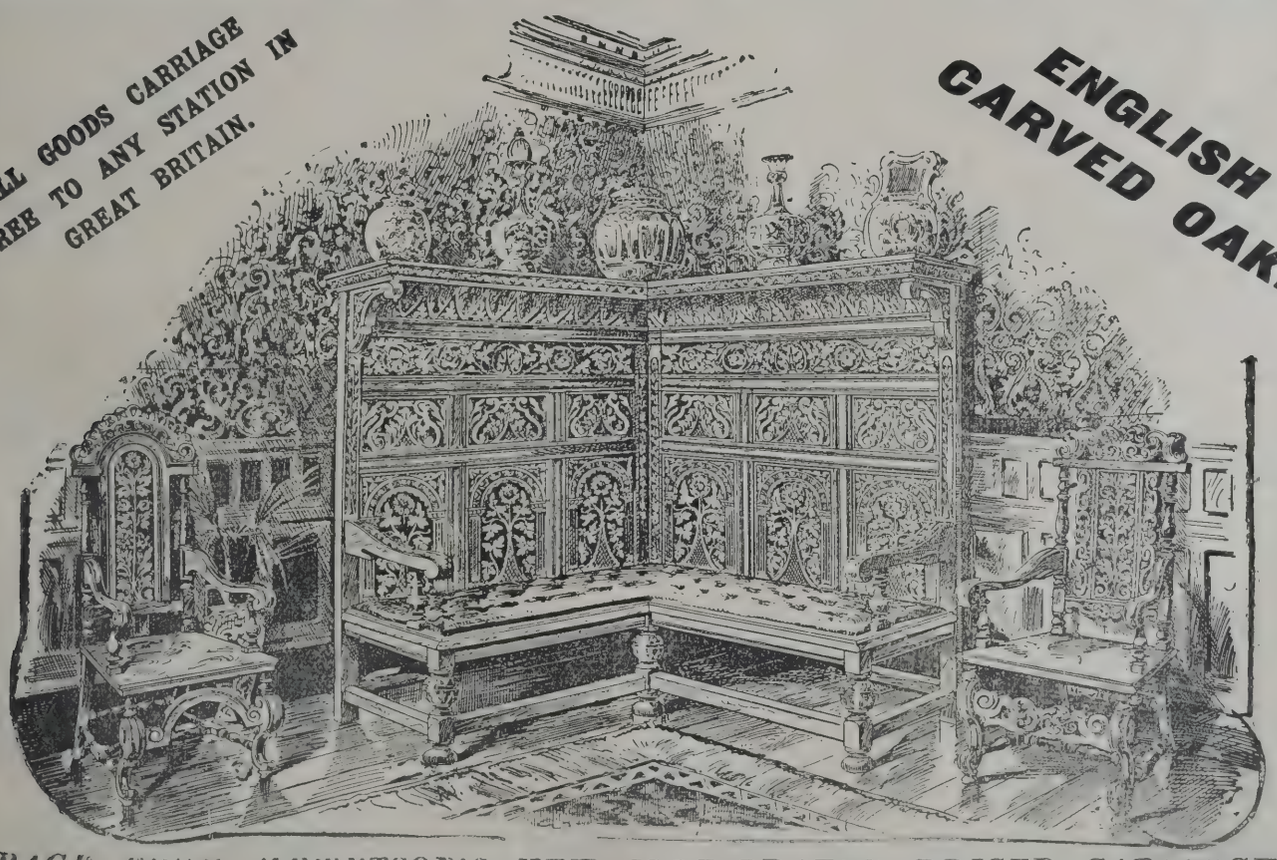
to the window-sills. Solid wood blocks are used for the floor, and there is marble mosaic work in the entrance. The church will front to Harehills Avenue, but there will be an additional entrance from Avenue Hill. The building is to be in the Old English style of architecture, with a handsome tower and spire at the junction of the two roads. About 67 feet long by 37 feet wide, there will be seats in the church for about 500 people. It is proposed to place the session-house and other rooms between the church and school. These will have a separate entrance. The carrying out of the whole scheme will cost about 7,000*l.*

SOME extensive new halls are to be erected for the Wesleyan Methodist West End Mission at the corner of Earl Grey Street and Wellington Place, Tollcross, Edinburgh. The ground is at present occupied by St. John's school and two blocks of comparatively new tenements of shops and dwelling-houses. The whole of these buildings will have to be demolished to make room for the new halls. A sum of nearly 20,000*l.* was paid for the buildings and ground. The street and basement floors have been planned as business premises. Ten commodious shops with extensive cellarage occupy these floors. The main entrance to the hall will be from Wellington Place by a wide corridor leading into a crush-room on an entresol floor. A wide staircase leads to large hall on first floor, and this hall is planned to accommodate, along with gallery, 1,600 to 1,700 persons. On the first floor there is also arranged a small hall seated to accommodate 280 persons, with platform at one end and classroom and lavatory accommodation at the other. The whole of the upper floors are arranged for classrooms, stores and caretaker's house. Special attention has been paid to the entrances and exits from these, as well as from all other parts of the building. Externally the buildings have been designed in a free treatment of the French Renaissance, and when completed will add considerably to the architectural amenities of the district. The whole scheme has been designed by and will be carried out under the direction of Messrs. Dunn & Findlay, architects, Edinburgh. The total cost of the scheme will be over 40,000*l.*

THE memorial-stone for the new parish church for Hutchestown, Glasgow, was laid a few days since by Sir John Neil Cuthbertson. The site of the new building has a frontage to Rutherglen Road of 125 feet, and to Rose Street of 108 feet. In addition to the church the site provides accommodation for capacious halls to seat 600 people. The church has been designed by the architect, Mr. Alexander Adam, St. Vincent Street, Glasgow, in the semi-Romanesque style of architecture. It is divided into side aisles and north and south areas, with side and back galleries, the seating accommodation being for 950. The special feature of the interior is a chancel arch of chiselled stone-work, divided into three sub-arches, the organ chamber being behind and the pulpit in front. The roof is an ingenious combination of iron and slate, and it covers the whole span without the usual clerestory. The walls are of red sandstone, with rock-faced courses and clean dressings round the windows and openings. The stone was obtained from the Corncocle Quarries, and the green slates from Elo Water in Wales. The main entrance is from Rutherglen Road, the doorway being 8 feet wide. There will be two other entrances, and the main entrance to the halls will also be from the same road. To the east of the principal entrance to the church a tower will be erected with four pinnacles, but no spire in the meantime. The cost of the building and site is estimated at 10,525*l.*



ELECTRIC NOTES.

THE directors of the Moffat Hydropathic have resolved to keep the establishment open throughout the winter in future, and to light it by electricity. The contract for the electric lighting has been placed, and will be proceeded with immediately.

TRIALS of electric lighting have been made at the Vatican, notably in the Raphael Galleries. The whole of the Vatican will be lighted by electricity in a fortnight's time. This is being done by special desire of the Pope.

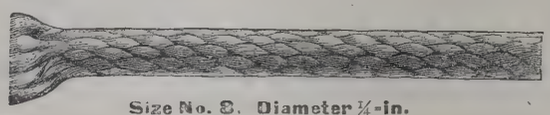
THE Niagara Electro-Chemical Company of Niagara Falls has awarded the contracts for an addition 50 by 125 feet to be made to its works on the lands of the Niagara Falls Power Company. The building will be of brick, with iron girders, and have a Mackwirth roof. It will form an addition to the sodium-peroxide department, and it is expected that it will be fireproof. The company will not at present increase its supply of electrical power, but in the near future expects to contract with the Niagara Falls Power Company for a large additional block of the electric energy. The new building is expected to be completed by the early part of February.

BOSTON, U.S.A., claims the distinction of being not only a city of light intellectually, but materially, and it bases its claim on the fact that "it has a larger number of electric lamps for every 1,000 inhabitants than any other city in the world." The figures presented by the *Boston Globe* in support of this contention show that Boston has 373 more lamps per 1,000 than Greater New York, the record standing 1,232 to 859 in favour of the hub. Third in the list comes "boastful Chicago" with 730. Then follow San Francisco with 660, St. Louis with 660, Cincinnati with 551, Philadelphia with 375, Baltimore with 373, Brooklyn with 286, Vienna with 246, Edinburgh with 242, Paris with 185, London with 184, Berlin with 178. And yet, it is admitted, "there are dark places even in Boston of the illuminati."

A CONFERENCE of considerable importance to municipalities possessing electric installations took place in Manchester on Tuesday. It was convened by the Lord Mayor of Manchester to organise opposition to the Lancashire Electric Power Companies' Bill, 1899, and the South Lancashire and Cheshire Electric Power Bill. Those Bills, it was explained by the Lord Mayor, who presided, would, if passed, give power to the promoters to go to the various towns of Lancashire and Cheshire, and supply electric power for lighting and motor purposes in a way that would trespass on the rights already obtained by the municipalities who had control of the electric supply. If their recommendations were adopted by Parliament, the control of the streets by municipalities for electric purposes would be done away with, and private companies would have the right of competing for the supply of the current. Steps were taken to bring the action of the conference to the notice of the Board of Trade, and the local members of Parliament, and an executive committee was appointed.

A SPECIAL meeting of the Garston District Council was held on Monday night for the purpose of considering the adjourned report of the special purposes committee upon the proposed transfer of the Council's electric-lighting order, obtained in 1897, to the British Insulated Wire Company on terms already reported. Mr. J. Pickthall presided. At the previous meeting a resolution was proposed for the adoption of the committee's report, and the discussion was now continued at great length, Mr. J. Rigby proposing an amendment that a clause be inserted in the agreement to the effect that the electric works and refuse destructor be not erected in a residential district. The amendment was defeated by six votes to four. Mr. Paton, after further discussion, said he thought a clause should be inserted in the agreement allowing the Council to repurchase the undertaking at the expiration of fourteen years on the best terms possible, and he proposed a resolution to that effect. He would rather cancel the agreement than allow the company an unlimited monopoly for more than fourteen years. The amendment was defeated by four votes to three, and eventually the committee's report was adopted.



THE Lancashire Electric Power Company have deposited a Bill for next session by which they seek incorporation for the purpose of providing stations for the production, storage and distribution of electricity. The works to be constructed under these powers comprise four central or principal stations, on certain lands set out in a schedule to the Bill, in the parishes of Aspull, Parr, Little Lever, and at the western corner of the Trafford Park estate, in the parish of Barton-on-Irwell. At these central stations the company propose to manufacture and sell everything necessary for "distributing energy for lighting and other purposes, public and private, and for converting the same into motive power, heat, or otherwise." The capital of the company is to be 3,000,000*l.*, in 300,000 shares of 10*l.* each, but with power to divide these shares into "preferred half shares" and "deferred half shares." It is provided that nothing in this Bill shall confer on the company the exclusive right to supply energy within the area of supply, or to hinder or restrict any other body or person from supplying or increasing their supply within the same area, nor shall the company hereafter be entitled to compensation by reason of any competitive supply. The profits of the company are proposed to be limited to 10 per cent. on the paid-up capital, subject to a sliding scale similar to the one in existence in many large gas companies. The South Lancashire and Cheshire Electricity Company have lodged a Bill for similar powers. Only one generating station is proposed. This will be erected on land at St. Helens, now in the possession of the British Plate Glass Company, Limited. The

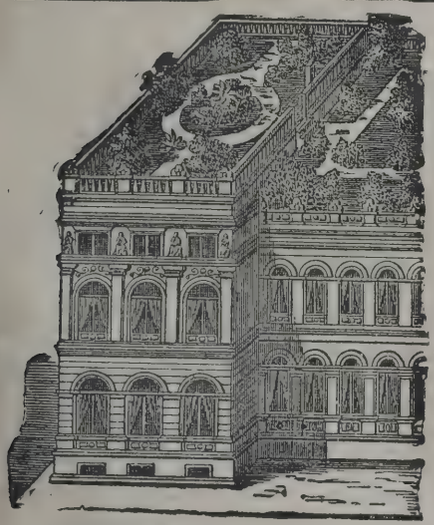
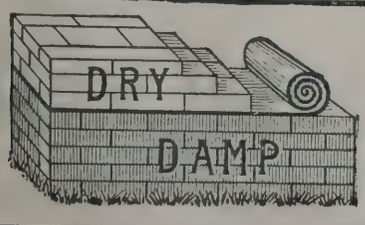
capital is to be 750,000*l.*, with power to borrow a further sum of 250,000*l.* The clauses in this Bill are almost identical with those in the larger company's Bill.

ADDINGTON CHURCH.

THE chancel of Addington Church, which has been restored and decorated as a memorial of the late Archbishop Benson, will be reopened and dedicated on Friday evening, the 20th inst., when the Bishop of Winchester will be the preacher. The work of restoration, which was planned during Archbishop Benson's lifetime, consists in the reopening of a Saxon window which had been blocked, probably, for six centuries, and the construction of a fine hexagonal oak ceiling on the underside of the ancient thirteenth-century roof timbers, in place of the lath and plaster ceiling which at some period had been substituted for the original boarding. The most interesting feature of the decorative work is a low reredos, of very beautiful perforated white alabaster scroll-work, with statuettes of four archbishops, under canopies, between the windows and in the north and south corners of the church. Archbishops Theodore and Benson are the principal figures, Cranmer and Laud being placed at the north and south ends of the reredos. The walls are adorned with richly varied diaper-work, figures and escutcheons. On the north side are the armorial bearings of Trinity College, Cambridge, Wellington College, Lincoln and Truro, all closely associated with the late Primate's life work. On the opposite wall are those of the five predecessors of Archbishop Benson, all of whom resided at Addington Park. Below the shields are figures of Cosmas on the south wall and Damian on the north wall, the Arabian brother physicians and martyrs, to whom an altar was dedicated in Addington Church; and on the east wall, for the same reason, the Virgin Mary and St. Catherine are represented, and above, at the apex of the roof, the Christ in Glory, with adoring angels on either side. The architect is Mr. Arthur J. Reeve.

VICTORIA STATION.





NO one will deny, says the *Daily Chronicle*, that Victoria Station is unsightly, and not a few engineers look upon it as a dangerously inflammable wooden structure. It was opened in 1860, when, by the way, it was regarded by the Brighton Railway officials as merely a "temporary shake-down." At that time the passenger traffic was not a quarter so great as it is to-day. However, the building has been made to serve until it is absolutely imperative, for the convenience of those who travel by that system from the West End terminus, that a larger station should be erected without further delay. As it stands the size of Victoria Station precludes any possibility of any additional excursion trains or improved main line and suburban services, which are most urgently required by the rapidly increasing population of Surrey and Sussex. Brighton—the nearest seaside town to London—Eastbourne and other resorts on the South Coast are complaining that their development is retarded by the impossibility of the company giving them a train service adequate to their requirements.

The result of the policy of delay in the past is that the scheme to be brought to the notice of the shareholders on the 25th inst. is both extensive and expensive—extensive owing to the necessity of meeting the demands imposed by the traffic developed by the new widenings of the line down to Three Bridges, and expensive because the value of land in the Metropolis has so much increased during the past thirty years.

When the new scheme is completed, the Brighton Railway's terminus will be one of the longest in London, and will, architecturally, be one of the handsomest. The additional accommodation is to be obtained mainly by lengthening the station. It is impossible to widen it to any extent, owing to the Chatham's terminus on the left, and the Buckingham Palace Road on the right. What widening there is will be made immediately beyond the Grosvenor Hotel, and will be parallel to the Buckingham Palace Road. Travellers on the Brighton have often realised the difficulty of trains entering and leaving the station. They have had to pass through the narrow neck of a bottle. This neck will be enlarged through the Buckingham Palace Road, and then there will be no delays on Grosvenor Bridge or in the station. The widening of the approaches to the station now suggested will allow of four lines (already authorised, and for which the land is being acquired) running into the terminus, double the number now existing. In the same Bill powers are sought to continue the four lines to Hayward's Heath, and eventually they will be extended to Brighton, thus enabling two lines to be set apart for express trains.

It is, however, with the actual station that the public is chiefly concerned. At the present time only eight passenger trains can be dealt with at one time. After the enlargement the number will be increased to eighteen, because the platforms will be twice as long as they now are, and because of re-

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Vol. LX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

arrangement. Moreover, there will be no more "knifeboard" platforms, for none will be less than 25 feet wide.

The elongation and widening will bring with it an improved service of trains, especially for the suburbs. There will be more excursions, and these "specials" will in no way disturb the ordinary traffic, as they do to-day. The entrance to the station for passengers will be 45 feet further away than it is now; that is to say, this amount of land will be added to the open space where cabs and omnibuses congregate; but with this comes a larger "circulating" area in the station for passengers, for the platforms will be 100 feet away from the booking offices. Further, there will be a proper cab-rank inside the station.

Roughly, the improvements thus briefly set out will cost nearly 1,500,000*l.*, and when they are completed—everyone will say the sooner the better—the Brighton Company's terminus at Victoria will be both useful and ornamental.

ENGINEERING PLANTS OF LARGE BUILDINGS.

THE prime considerations in the mechanical equipment of the modern building are safety, reliability, simplicity, small space occupied, low first cost, and low expense of operation and maintenance. All these cannot, of course, be secured together, but good judgment must be used in selecting the apparatus which will best meet the requirements of the particular case. At a recent meeting of the St. Louis Chapter of the American Institute of Architects, Mr. William H. Bryan read a paper on modern practice in this field. He said:—

In general it may be said that the number and size of units—boilers, engines, pumps, &c.—should be such that, with any one unit out of service for cleaning or repairs, the remaining units can handle the maximum service if called upon to do so. As the best machinery can safely stand overloads of from one-third to one-half for short periods, there should never be less than three units, each capable of doing from one-third to one-half the maximum work.

The ordinary tubular boiler is preferable where there is sufficient room, where extreme safety is not essential, and where first cost is of prime importance. Where space must be economised, however, and where extreme safety at high pressure is necessary, the water tube boiler will be found worth its increased cost. In economy of fuel, quick steaming and dryness of steam, neither type has any advantage over the other, assuming that both are intelligently designed and operated. The working steam pressure should be 90 to 100 lbs. if simple engines are to be used, and 125 lbs. if compounds are selected.

The chimney should be at least 100 feet high above the grates, and higher if necessary to bring its top well above adjacent buildings. In area it should equal the aggregate tube area of the boilers. For water tube boilers one-ninth the grate area may be used. It should preferably be circular in section, and lined with firebrick. The smoke flue leading to it should be at least of equal area, circular in section, and as short and direct as possible. Where bends are unavoidable, they should be of long radius. Good draft is of prime importance in securing the best results with the fuels ordinarily burned in St. Louis. Smokeless furnaces should always be adopted, for æsthetic and sanitary as well as economical reasons. There are many good devices of this character, such as the down draft, the automatic stoker, and the firebrick arch.

The steam-engines and large pumps should usually be of the compound type, where the steam is worked through two cylinders in series, thus giving an economy of 20 to 40 per cent in the use of fuel over simple or single cylinder engines. The slow speed Corliss engine represents the highest economy, but is rarely available for buildings, on account of the space it requires, and the fact that it cannot be directly connected except to low-speed, high-priced dynamos. Compound high-speed engines occupy much less space, are capable of direct connection, regulate better, and approach the single cylinder Corliss closely in economy. Where space is extremely valuable, high-speed engines of the vertical type may be successfully employed. There are now a number of satisfactory makes on the market at reasonable figures of cost. Very close regulation of speed is now possible without danger of racing, and should be required. The variation over all ordinary ranges of load and steam fluctuations may be kept within 1 per cent., and should never exceed 2 per cent.

The dynamos should, of course, be of the low-speed direct-connected multipolar type, over-compounded slightly. They must be capable of standing a reasonable overload for short periods, and must not heat unduly in any parts under any conditions of service. Their regulation, non-sparking qualities and efficiency, not less than 91½ per cent. at full load, should also be guaranteed. The switchboard should be of marble or slate, so located that all parts are readily accessible. It should

be provided with all necessary indicating, regulating, switching and testing instruments, including, if the plant is a large one, a recording watt-meter. There should also be provision for a connection to an external plant for use in the event of accident to the local plant, or at night and on Sundays and holidays.

The distributing system may be either two or three wire, at 110 or 220 volts pressure, depending upon the character of the work. Arc and incandescent lamps and motors may all be operated from the same mains and apparatus, but it is customary to bring all the wires back to the switchboard separately for ready control. The enclosed arc lamp has practically displaced all other types on account of its uniformity of operation, noiselessness, simplicity and freedom from frequent carboning. Its efficiency, however, is very low.

The elevator system presents the most complicated problem connected with the modern building, on account of the rapidity with which advancements are being made in all the standard forms of hydraulic, electric and steam. An intelligent selection can only be made by carefully studying the requirements of the particular building under consideration. Until very recently the hydraulic elevator stood at the head, and for a wide range of service is still, in my opinion, without a peer. It has behind it a long record of excellent performance, small repair bills, great reliability and durability, and smoothness of operation. Recent improvements in using higher pressures, and high-duty pumping engines, have given it a renewed lease of life. Broadly speaking, I should say that the hydraulic elevator is preferable where the speeds are high, the lifts long, where many stops and starts are made between terminals, and where the average load approximates closely to the maximum.

The principal objection to the hydraulic elevator as usually constructed is, next to its high cost, its low fuel efficiency, due to three features. First: No part of the live load can be counterbalanced, nor even all of the dead load. Second: The maximum amount of power is required irrespective of the load, the empty car requiring as much as the heaviest load. Third: The direct-acting steam pump ordinarily employed is very wasteful in the use of steam. The first two points seem to be very difficult to remedy, but the third may be met in large plants by the use of high-duty pumping engines.

The electric elevator has made immense strides in the last few years, and to-day is available for a wide range of work. When counterbalanced to half the average load the power required is only that necessary for acceleration and to overcome friction, assuming that the same total load is handled in both directions. It can be counterbalanced as desired, and there is a reduction in power with light loads. Being always operated by automatic engines, preferably compound, its fuel efficiency is high. Being a drum machine, however, it has its speed and travel limitations. Furthermore, for frequent stops the starting current becomes an important factor in lowering the fuel efficiency and bringing undue strains upon the generating plant. This, however, is being very largely remedied in the most recent types. The electric elevator would seem to be preferable for moderate speeds and lifts, and where the average loads are light and the intermediate stops not too frequent. An important advantage of the electric elevator is that it is unnecessary to duplicate the generating plant. The same dynamos which generate electricity for lights furnish current for the elevator motors, and one reserve unit serves for both. This greatly simplifies the arrangement of the plant, reduces its cost and economises space. The electric elevator has yet to demonstrate its equality with the hydraulic, however, in the matters of reliability and low cost of repairs. The latest forms, however, appear to meet all reasonable requirements in these directions.

Coming now to the heating, ventilating and piping systems, we find that the exhaust steam from the engines is used in the heating mains. As a rule there is a surplus of exhaust in the up-to-date building, even in the coldest weather and where compound engines are employed. The most common system is and probably will remain the direct. Here in the West we have come to use the single pipe system almost exclusively, on account of its greater simplicity and lower cost. Now that the rules governing its design are fairly well understood, it is in service an entirely satisfactory plan. In the design of direct heating plants two points are frequently overlooked — the necessity of heating the large amount of air which finds its way through the doors and windows, shafts, &c., and the heat loss due to unceiled roofs. These are of prime importance.

Among meritorious improvements recently introduced, and which are meeting with general adoption, are the Paul and Webster systems of air-removal from the radiators. They possess many important advantages, the principal ones being, first, the ability to heat the building without pressure, thus greatly relieving the engines whose exhaust is used, increasing their power and improving their economy; and, second, getting a greater amount of work out of a square foot of radiating surface, thus reducing the amount required, the space it occupies, and its cost.

MUNICIPAL CONTRACTS IN AMERICA.

ON April 17, 1894, says the *Engineering Record*, a contract was drawn between Messrs. G. W. & W. T. S Crichfield and the Bermudez Asphalte Paving Company, a Chicago corporation, which led to considerable litigation, and finally in October to a decision of the Supreme Court of Illinois that throws the searchlight of publicity on the methods employed to obtain or increase its business in Chicago. The terms of this interesting contract have been summed up by Judge Magruder substantially as follows :—

Section 1 provided that the Crichfields were to act as agents of the company to promote its asphalte paving business in the city of Chicago, and were to devote their whole time, attention and best energies in and about such business as the company might direct for the period of one year from the date of the agreement. Section 2 provided that the company should pay to the Crichfields 17½ cents per square yard for asphalte paving promoted by them for which a contract had been made between the company and the city. It further provided for a payment of certain excesses in the prices of curbing and gutters, which it is unnecessary to go into in this place. If the Crichfields promoted any work, but the company failed to secure a contract for it, no payment was to be made; while on the other hand, if they promoted a given amount of asphalte paving, kerb and gutter, they were to be paid for it, provided the company secured the contract for it or for an equal amount of work. Section 3 provided that the payment of commissions was to be made on the basis of the estimated amount of work for each contract at the time it was awarded by the city. The next section guaranteed G. W. Crichfield 120 dols. a month and W. T. S. Crichfield 80 dols. a month, these guarantees to constitute a lien in equity on any work for which ordinances were passed prior to the expiration of the period of the contract. Section 5 provided that all incidental expenses and trouble which the Crichfields incurred in promoting asphalte paving, "or in aiding and assisting in the election of officers," or in any other matter pertaining to the promoting of pavement, kerbs and gutters was to be borne by the company. The same section stipulated that work of the Crichfields should be in favour of Bermudez asphalte or any other material directed by the company.

Under the terms of this interesting contract, the Crichfields did considerable work and received a large sum of money. As luck would have it, however, they disagreed with the company over the final payment of about 5,000 dols., and accordingly brought an action against the company for this sum. The case was carried to the Supreme Court, and there it was stated that the only question it was necessary to discuss in the matter was whether the contract sued on was one the Courts should refuse to enforce.

Judge Magruder, who wrote the opinion of the Supreme Court, considers that the meaning of the expression in the contract "to solicit and promote the asphalte paving business in the city of Chicago" is to solicit by the exercise of influence and other means the passage of ordinances and the letting of contracts by the members of the Common Council of that city This interpretation of the agreement is confirmed by the testimony of the parties. Mr. G. W. Crichfield said that the methods adopted for promoting such business included "the influencing of a public sentiment in favour of that kind of improvement which will result in the passage of ordinances, the making of assessments and the making of contracts". He said that he took whatever steps he deemed advisable, honourable and fair, to secure the paving of streets with asphalte. He admits that in some cases he saw aldermen to get them to favour the passage of ordinances, and was occasionally present at the Council meetings when these ordinances were considered. Mr W. T. S. Crichfield testified that he usually followed the ordinance up, to see "that it was properly drafted, and to see that it was passed and that the proceedings were straight, and that when the assessment was ready, if any objections were filed against the paving o the streets with asphalte, he would make an endeavour to get the objectors to withdraw the objections, and get the assessment confirmed and get the contract passed."

This testimony is especially significant when read in connection with section 5 of the contract previously mentioned and the following facts brought out by the evidence :—"This part of the contract may be fairly interpreted to mean that members of the Common Council were to be elected who should favour the awarding of paving contracts to the company. The evidence shows that George W. Crichfield received under this contract from the company 5,432 dols, and that W. T S. Crichfield received 4,240 dols., making 9,672 dols. The evidence tends to show that they also received other moneys besides those thus mentioned. In addition to this they claim in this case 5,115 41 dols."

The Supreme Court ruled that there are some striking features of this agreement which stamp it as being against

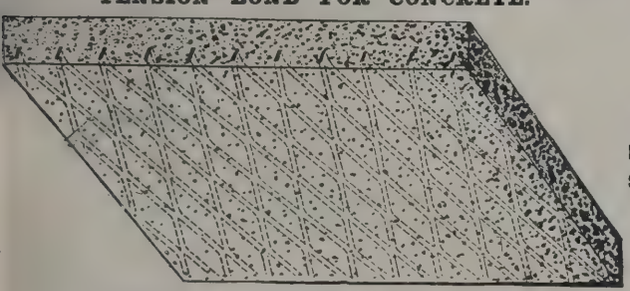
public policy. A special assessment for a public improvement under the Illinois statutes is a species of taxation, and is authorised only as an exercise of the taxing power. A special assessment should not be levied except for a needed public improvement. The idea of making a contract to promote the levying of a public assessment, not to secure to the public a needed improvement but to enable a paving company to get a job, is not only against public interest, says the Court, but is abhorrent to all proper ideas of justice and honour. Hence it was ruled that any contract by which parties agree to obtain ordinances by solicitation and the exercise of influence on public officials with a view of obtaining contracts resulting from the passage of such ordinances, is against public policy and will not be enforced by the Courts.

The Supreme Court of the United States long ago decided that contracts for the use of influence to be brought to bear on legislators are void, and it is hard to understand how any parties could put enough reliance in a document of this sort to make it the basis of a suit. In Marshall *v.* Railroad Company, 16 How. 314, a special contract was sued on, whereby the plaintiff was employed to attend the sessions of the Virginia Legislature in order to superintend any proceedings to obtain the right of way through the State on behalf of a railroad company. It was in this case that the United States Supreme Court said :—"Bribes, in the shape of high contingent compensation, must necessarily lead to the use of improper means and the exercise of undue influence. Their necessary consequence is the demoralisation of the agent who covenants for hem'

The Illinois Court says that the contract under consideration was one providing for a contingent compensation for obtaining ordinances for paving. An ordinance passed by the Common Council providing for the paving of a public street is a species of legislation as much as an Act passed by the Legislature, though the body passing it is subordinate in its character and created by the Legislature itself. The rule, therefore, which makes void a contract for a contingent compensation for obtaining legislation is held to apply as well to the Common Council of a city as to the Legislature of a State.

It was claimed during the trial that the expenses and trouble contemplated by Section 5 of the contract may not have been incurred or suffered. In other words, the means provided for in that section for accomplishing the purpose of the contract need not necessarily be resorted to, and may not be resorted to. But the Court decides that the section is as much a part of the contract as any other, and that therefore the whole contract is rendered null and void by the illegality of this particular section.



The claim was also made by counsel that the conditions of modern life are widely different from those of the times immediately preceeding us, and that in view of the revolution in business methods which has taken place in modern times what was decided to be against public policy in the past generation may be a common and ordinary method of doing business to-day which is approved by the common sense of man. On this head the opinion of the Court reads :—"That which is against public morals and public decency should be subject to the condemnation of the Courts in all generations. Righteousness is the same to-day as it was yesterday. The refinements of modern civilisation may have increased the forms of bribery and corruption and made them more dangerous and insinuating, but they are none the less subject to the reprobation of honest men." The counsel further urged that as no question had been raised as to the validity of the contract in the lower Courts nor by objections to the introduction of evidence, this particular phase of the agreement was not before the Court. It was decided, however, that where a contract is against the common good, it is unnecessary for the defendant in the case to plead this objection.

It seems hardly necessary to add that the Court found that Messrs. Crichfield had no legal hold on the Bermudez Asphalte Paving Company for the 5,115 41 dols. they claimed as due to them under their contract with the company for lobbying services.

WORKMEN'S DWELLINGS IN GERMANY.

THE United States consul at Chemnitz writes that there is a movement on foot to furnish working men with better dwelling-places in Germany. At present they are crowded into buildings which often look like barracks. The proposed houses will be built upon plots of ground about 16½ feet wide by 102 feet deep, thereby allowing for a front yard for flowers and a back yard for a vegetable garden and shed, the latter for the keeping of poultry or some domestic animal. The houses will contain five rooms. A parlour and kitchen will be on the first floor, the parlour containing a porcelain stove and heating pipes, and the kitchen a wash boiler and stove. The three bedrooms on the second floor will easily hold five or six persons, and can be made to accommodate ten. In the largest an iron stove will be placed. A pump will provide water where the city waterworks

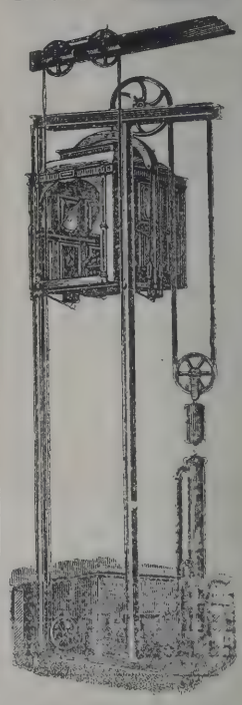
PRICE LIST AND ESTIMATES ON APPLICATION

do not extend to the house. The cost of such a house and plot of ground when a number are built at a time will be between 170*l.* and 190*l.* It will let for about 9*l.* a year—that is for the same price the working-man has to pay for two rooms in the barrack-like tenements of the large cities.

SANITARY INSPECTORS' ASSOCIATION.

THE president of the Association, Sir John Hutton, gave his annual address to the members at Carpenters' Hall, London Wall, on the 7th inst. The Association, he said, numbering 685 members, practically represented all England, and several of the provincial branches, particularly at Belfast, were showing active, vigorous life. The sanitary administration of London was a work of the utmost difficulty. The congregation of 4,464,717 persons in anything like sanitary safety was not a light accomplishment. Of London's forty-three sanitary districts the largest (Islington) contained a population of 341,134, but there were others, like Lambeth and Camberwell, nearly as large. If the people of Islington stood in line, joining hands, they would reach from Euston to Manchester. It was in such circumstances most satisfactory to find the death-rate of London 19·4, or considerably less than those of Manchester, Liverpool, Leeds, Birmingham, Sheffield and other large towns. Among the topics considered in the address were dust-destructors, by which the power of generating electricity for lighting purposes was made possible, food and meat inspection, cremation and the preparation of ice-creams. A cordial vote of thanks was accorded to the President for his address.

MARYPORT DOCKS.



PARTICULARS of the offer made by the syndicate who propose to purchase and enlarge the docks at Maryport have now been laid before the bondholders. The promoters have increased their offer, in accordance with the recommendation of Mr. Fraser, a Liverpool actuary employed by the Harbour Commissioners, who recommends that 161,337*l.* be paid the mortgage holders in cash, and 98,823*l.* in Five per Cent. Preference shares, apportioned as follows:—Classes 1 and 2, their face value in cash, 54,155*l.* and 1,950*l.* respectively; class 3 (125,870*l.* face value), 69,386*l.* in cash and 55,067*l.* in shares; class 4 (84,600*l.* face value), 25,380*l.* in cash and 31,725*l.* in shares; and class 5 (48,121*l.* face value), 10,446*l.* in cash and 12,031*l* in shares. From an explanatory statement made by Mr. Senhouse, the chairman of the Harbour Commissioners, it appears that, if the bondholders accept the offer, the promoters propose to form a company, with debentures not exceeding 400,000*l.* at 4 per cent., and a share capital not exceeding 300,000*l.*, of which not more than two-thirds shall consist of Five per Cent. Preference shares. He points out that steamers of 2,500 to 3,000 tons have frequently to wait four or five days before they can get a tide by which it is safe to enter the dock, whereas, if the channel were deepened and the dock enlarged to admit steamers of 7,000 tons, 1*s.* per ton might be saved on the freight on iron ore from Bilbao and adjoining ports, and 350*l.* saved on each cargo, which would make all the difference to the English manufacturer in successfully competing with his foreign competitor. The present net income is 16,000*l.*, which would secure the interest on the debentures of the proposed company, but, assuming that, owing to the increased trade that would follow the enlargement of the dock, the future net earnings would increase by only 60 per cent., this would amount to 26,000*l.*, and would suffice to pay 5 per cent. on the 200,000*l.* preference shares. Increased accommodation for the shipping trade must be provided in the district, and, if they did not provide it, others elsewhere would, and their trade would be diverted, while they must not lose sight of the fact that increased shipping facilities at Maryport would probably lead to a development of new public works. In conclusion Mr. Senhouse states that, as the holder of 28,000*l.* worth of the existing debentures, he strongly advocates the adoption of the scheme.

HUNSLET NEW WORKHOUSE.

IT has been decided to erect a new workhouse at Hunslet at an estimated cost of about 54,000*l.*, and affording accommodation for 415 inmates and thirty-nine vagrants, with provision for future extension for 209 inmates, bringing up the total to 663. Mr. J. H. Morton, architect, of South Shields, has prepared the drawings, which show the various buildings grouped upon the site in the most natural manner, taking full advantage of the best aspects, and the most convenient positions to suit the gradients. The entrance buildings are placed at the north-west corner of the site, near the bridge in Wood Lane. The

main buildings are set back from the road, with the infirmary behind. The isolation hospital is in a remote, but convenient, position, as are also the mortuary, post-mortem room, &c. Through the main gates is the principal access to the workhouse grounds, and conveniently near is the porter's residence, with male and female receiving wards adjacent thereto. Separate entrances are arranged for male and female tramps. The main building is composed of an administrative block and four pavilions. At the right of the entrance hall is the master's office, with separate business entrance. In front of this is the clerk's office or committee-room. On the left of the main entrance are the master's dining-room, kitchen and pantry, and immediately behind the master's house are two officers' mess-rooms. The dining-room, behind the master's house, will be 70 feet by 40 feet, and is large enough to provide for future extension. The kitchen, 40 feet by 28 feet, will be fitted up with apparatus capable of cooking for all the inmates of the main building and infirmary. At one side of the house court is the boiler-house, engineering department, &c. The buildings for laundry purposes consist of a large receiving-room for dirty linen, &c., and adjoining is the general workhouse. The men's work-yard will contain large workshops for tailor, shoemaker and joiner, and a paint store.

The inmates' departments consist of four pavilions. The aged and infirm are in pavilions (each side of the administrative block) two storeys high, and the able-bodied are provided for at each end of the corridor in pavilions three storeys in height. The day-rooms have cheerful bay windows, and there are large airing-courts with footpaths of cement or asphalte, enclosed by light iron fencing where practicable. For the aged married couples there are four cottages, each containing one room, fitted up with kitchen and press, arranged with gardens and open palisading, looking into Wood Lane. Immediately behind is the block for probationary children, with cheerful playgrounds and caretaker's rooms.

In the infirmary building the central block contains, on the ground floor, superintendent nurse's sitting-room, nurses' general room, kitchen and pantry, doctor's room, dispensary and stores, and waiting corridor for patients. On the first floor there are eight nurses' bedrooms, a large linen store and bath-room. As to the sick wards, the pavilions for males and females, right and left of the nurses' home are 160 feet apart. Each pavilion contains large ordinary sick wards on each floor, 24 feet wide, with pleasant day-room screened off by a movable glass partition.

The imbeciles are provided for in blocks 60 feet distant from the general sick wards. Each are provided with attendants' rooms, padded rooms, day-rooms, &c. Over the imbeciles' ward, on the women's side, is the maternity ward, and over the imbeciles' ward, on the male side, is the ward for sick children, with day-rooms, nurses' room, &c.

The lighting in the establishment may be of gas throughout or by electricity—if by the latter the cost would be 2,000*l.* A complete and efficient system of drainage will be carried out, with perfect flushing and ventilation. The disposal of sewage from the buildings would have to be considered, but Mr. Morton suggests that the Guardians should purchase or rent 2 or 3 acres of land near the south-east corner of the site to lay out for the disposal of the sewage, either by intermittent land filtration with precipitation tanks, which must be at least 300 yards away from any building, or by means of bacterial tanks, especially if the experiments now being made prove their efficiency and economy. Either system would cost about 500*l.* The rain water from the roofs will be collected in underground tanks. The general water supply will be from the 8-inch main in Wood Lane, belonging to the Rothwell Urban District Council.

LONGMORE HOSPITAL FOR INCURABLES.

THE extensive alterations and additions which have been in progress at the Longmore Hospital for Incurables, Edinburgh, are now completed, and the formal opening of the new wing took place on the 5th inst., the Duchess of Buccleuch having consented to be present at the ceremony. The additions consist of a new wing, and, detached from the main building, a laundry and washing-house, mortuary, post mortem room and chapel. In connection with these additions considerable alterations and rearrangement of the existing structure have been made. The new wing is of L shape, with a frontage to Salisbury Place of 56 feet, in prolongation of that of the original building, and a frontage to the west of 130 feet. A considerable area of ground between the new west front and the buildings facing Causewayside has been cleared of buildings and laid out as garden ground for the patients. The new wing, two storeys in height with a basement, is attached to the original building by a wide corridor of iron and glass, thereby placing it in close connection with the kitchen and administrative department of the hospital. The ground floor is set apart for

the reception of phthisical cases, there being a large ward for female patients to the south, and at the west extremity a corresponding ward for men. Each ward has in a detached building bath and lavatory accommodation of the most modern type, and the walls and floors are tiled, so as to secure the greatest degree of cleanliness. The entire capacity for beds is from 1,500 to 1,800 feet. On this floor there are also a ward kitchen and staff nurses' room. The connecting corridor separates the male and female wards, and passing across the building terminates in a covered porch, giving access to the garden. The basement floor, which is used for storage, is reached by a stair placed below a broad staircase to the upper storey. The upper floor is laid out for the accommodation of cancer cases. There are two wards facing Salisbury Place for three and nine beds respectively, two wards for single beds, one ward for two beds, and one for six beds with bath-room and lavatory accommodation placed so as to be easily accessible. There is also a ward kitchen and staff nurses' room in this floor. The entire capacity of these wards runs from 2,000 to upwards of 3,000 feet per bed, and special arrangements have been provided for the introduction of fresh air drawn from above. The new building is of fireproof construction, and the ward floors are laid with specially prepared teak wood. The wards are heated by steam radiators and open fireplaces on the Teale system. Necessarily, the considerable extension of the hospital involved a reconstruction of the kitchen department and the provision of additional rooms for the staff. The kitchen now measures 25 by 24 feet, and is ventilated and lighted from two sides. The kitchen store-room and larder walls are all tiled to the ceilings. Additional nurses and servants' rooms are placed over the kitchen in rooms formerly occupied by patients, a bedroom and sitting-room being specially provided for any case of sickness in the nursing staff. The new washing-house and laundry are in a separate building, to which the boiler and engine-house are attached. The whole building is constructed internally of white glazed brick, and in addition to the general washing-house and laundry there is a separate washing-house and laundry for the staff. Equipped with the most modern machinery and special ventilating fans, complete freedom from steam in the buildings is secured. The boilers are provided with Green's economisers, and all waste steam is trapped and utilised for the boiler water supply. The whole building is now fitted with electric light, and an electrically-driven elevator has been installed for the conveyance of infirm patients to and from the upper floors. The drainage system has also been remodelled, iron pipes being everywhere substituted for fireclay formerly in use, and the main drains and connections are placed in subways so as to be easy of access and inspection. The drainage subway has been utilised to give access to the mortuary buildings. These are placed at the Causewayside entrance to the hospital grounds, and consist of a post-mortem room, mortuary, chapel and specimen-room, with a dark room for photographic purposes attached. The post-mortem room is equipped in the most modern fashion, and its walls, like those of the mortuary, are lined to the ceiling with glazed tiles. The alterations have been designed and carried out by Mr. J. M. Dick-Peddie, architect.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C. from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents

27339. Carl von Forell, for "Process for the production of cement from limestone and blast furnace slag."

27404. John Isaac Richards, for "Improved press for pressing bricks, tiles, pipes and the like."

27426. Charles Gordon, for "Improvements in or connected with means for introducing warmed fresh air into buildings or apartments."

27431. James Hastie and Joseph Gill, for "Improvements in the manufacture of cement."

27526. Joseph Matthias, for "Improvements in thermo-electrical building bricks or blocks."

27571. William Walter Bengough, for "Improvements in apparatus for fastening and securing scaffold poles together for building temporary stands, structures, bridges and the like."

The Architect.

THE WEEK.

Two decisions were given in the Court of Appeal on the 14th inst. which are of much importance in the interpretation of the Workmen's Compensation Act. In the first schedule of the Act the phrase "average weekly earnings" occurs more than once. What is an "average"? Income-tax commissioners or assurance societies would quickly supply an answer. The respondent was a workman who had earned 70*l.* 7*s.* 9*d.* in the course of a year. That was equivalent to 27*s.* weekly, counting fifty-two weeks in a year. The legal compensation would then be 13*s.* 6*d.* a week. The county court judge who first heard the case considered that the number of days a man was absent through sickness or other cause should be taken into account and a lower divisor than fifty-two employed. In that way the weekly earnings rose to 1*l.* 9*s.* a week, and the compensation would be 14*s.* 6*d.* weekly. The employers appealed. The Court of Appeal however held that the total amount of a year's earnings should be divided by fifty-two and not by a less number. The definition of average may therefore be considered settled. In fact, the Act itself indicates how averages are to be arrived at, for it says, "If the period of the workman's employment by the same employer has been less than the said three years, then the amount of his earnings during the said three years shall be deemed to be 156 times his average weekly earnings during the period of his actual employment." The second case arose out of the stipulation about a building having to be 30 feet high in order that accidents could be brought under the Act. The workman was employed on a wall in Liverpool which was not raised to that height at the time of the accident, but the county court judge decided in his favour. The builders appealed. Their lordships considered that in Section 7 of the Act the words "which exceeds 30 feet in height" were only coupled with the words "and is being constructed or repaired by means of a scaffolding, or being demolished"; and that the antecedent to the following words, "or on which machinery driven by steam, water or other mechanical power is being used," was the word "building" simply, and not the words "building which exceeds 30 feet in height." Therefore, if the building was one on which machinery driven by mechanical power was being used, it was not necessary, in order to bring the case within the Act, that it should also be 30 feet high. Builders will not be easily convinced of the justice of the decision. The words of the Act are:—"This Act shall apply only to employment by the undertakers, as hereinafter defined, on or in or about a railway, factory, mine, quarry or engineering work, and to employment by the undertakers as hereinafter defined, on or in or about any building which exceeds 30 feet in height, and is either being constructed or repaired by means of a scaffolding, or being demolished, or on which machinery driven by steam, water or other mechanical power is being used for the purpose of the construction, repair or demolition thereof." An architect or builder would say there is no manifest exception in cases of buildings of less than 30 feet on account of the use of machinery. The reference to machinery is apparently in order to make the word "building" more comprehensive, but of course the definition of the Court must be accepted.

THE Court of Appeal has confirmed the decision of Mr. Justice NORTH, and the attempt of the Corporation of South Shields to take premises compulsorily which were not shown as within the limits of deviation on the Parliamentary plans is once more defeated. We hope the repeated breaches of privilege will be brought under the notice of the House of Commons, for if the contention of the Corporation were accepted Parliamentary plans would become artifices to deceive people, and railway and other companies would employ them for that purpose. It may be well to repeat the circumstances of a case that must amaze Parliamentary agents and engineers. In 1896 the Corporation obtained an Act authorising the construction of a new street. The most important section ran as follows:—"The Corporation may enter upon, take and use all or any part of the lands following shown on the deposited plans and described in the deposited book of reference—that is to say, for the purpose of street works the lands shown on the deposited plans in connection therewith and which they may require for the purposes thereof respectively." It is well known that "the lands shown" refer to those comprised within the limits of deviation. If parts outside the limits are drawn it is with the object of enabling people to judge what extent of a field or other premises is likely to be required. The Master of the Rolls and the other Lords Justices do not apparently realise that the only parts which come within the purview of an Act must be within the marked limits. The Master of the Rolls said:—"Whether the Corporation could for any purpose take any land outside the limits of deviation, it was not necessary to decide. He was not satisfied that they could not take land shown on the deposited plans outside the limit of deviation for purposes he could suggest, such as to make an approach—engineering purposes he might call them." If land for an approach to a bridge or crossing is required it has to be indicated on the Parliamentary plans, and in many cases the limits of deviation are extended in order to comprise such approaches. It is not an academic question for discussion but one of procedure, and the Courts have no power to interfere with standing orders. But judges do not wish to announce that they also have to keep within fixed limits. The land which it was intended to take or seize could not be described as required for an approach; it was simply a piece of land the value of which would be increased by the proximity to the new street. The Corporation considered the ratepayers ought to have any benefit which arose, and in one sense that was a reasonable conclusion; but it should have been determined on before the plans were lodged. It is plain, however, that the requirements of Parliament in such cases are not fully understood in the Courts, and on that account the case should receive attention from both Houses.

THE declaration of the Chairman of the London County Council that architecture was, of all the arts, the one which was nearly related to municipal functions, if it stood, would be considered as promising well for the future. The words would indicate that the authorities had awakened and were able to realise their responsibilities. But when immediately afterwards it was announced that the County Council would keep the control of the architecture of the new thoroughfare from the Strand to Holborn in their own hands, the whole character of the relation between architecture and the Council is altered. Does Mr. MCKINNON WOOD imagine that the ordinary County Councillor is competent to judge an architectural design? Can he point to any action of the Council which reveals the existence of the qualities required in those who set up as arbiters of taste? May we not assume that designs will be treated in the same way as the candidates for the office of superintending architect, and suitability will be passed over? The Council cannot be too careful about the character of the buildings to be erected, but for the sake of the new street we hope the members will control their ambition to pose as judges of architecture.

MESOPOTAMIA, although its name may be considered blessed, does not bring much joy to the archæologist. It has not been explored by experts, and it is too generally supposed to be a region that was always in possession of nomadic tribes, and they do not leave many things to employ archæologists. The German EMPEROR has apparently resolved to apply tests in order to discover whether Mesopotamia is as uninteresting as Europeans suppose. An architectural expedition is about to be sent there under the guidance of Dr. KOLDEWEY, of the Görlitz School of Building. It is anticipated that all that is necessary is to dig in order to discover sculpture that will be as interesting as any derived from Nineveh, and the collection will raise one section of the Berlin Museum to the level of the Louvre or the British Museum. The authorities also expect that knowledge of Assyrian inscriptions will be increased by the expedition. As no rigid limit has been fixed for the excavations, they are likely to be also carried out in Assyria and Babylonia.

AN ARCHÆOLOGICAL PUZZLE.

ONE of the advantages of controversy is the more clear understanding which is attained of the points of dispute. Before a contest of wits begins there ought to be no doubt about the positions of the parties who engage in it, but so long as men are men we suppose there will be vagueness in ideas and a want of precision in words, and from them the majority of controversies arise. At one time archæology was kept alive by means of the ardour of opponents and supporters of theories which the smallest object could inspire. It was rare to find either side acknowledging defeat, and the battle could never be considered at an end, but that difficulty had the advantage of suggesting the uncertainty of knowledge, and of demonstrating the necessity for further investigations. Of late years there has been little seen of that pugnacity which was once a distinguishing characteristic of the true archæologist. It cannot be said that the science has gained by the profound peace. Indifference has followed, and if that is long continued it may lead to decay and other consequences which are not advantageous.

For the sake of archæology we are therefore glad to see indications of a controversy of the old-fashioned healthy character in Scotland. So far as they have gone the preliminary skirmishes are most promising. It is not to be expected that champions after a period of quietude can use their weapons freely, but with a little practice the stiffness will wear off, and then we may hope to behold some satisfactory passes between the parties. The subject of the contest is interesting in itself, but as in the old days it is likely to be set aside and something more personal substituted. The lists ought then to be longer than the columns of the largest newspaper—

> Such combat should be made on horse,
> On foaming steed, in full career,
> With brand to aid, when as the spear
> Should shiver in the course.

But let us turn to particulars. Our readers may remember that we have referred from time to time to the discovery of a primitive settlement, somewhat resembling a crannog in character, which Mr. W. A. DONNELLY, an artist, discovered at a place called Dumbuck, near the Clyde. That class of remains is always difficult to investigate, and requires a liberal expenditure of money as well as of time. At Zürich FERDINAND KELLER was able to command the services of many enthusiastic archæologists, and the State was not backward in giving its support. But in this country a discoverer must mainly rely on his own exertions. Apparently Mr. DONNELLY accepted the inevitable. It was not his first discovery. About three years ago at Dunbuie, which is not far from Dumbuck, he found a primitive fort, which was explored by the Helensburgh Naturalist and Antiquarian Society. The relics met with in the fort were not of a commonplace character. The ornamentation on some of the objects was described as pre-Celtic, and without any indication of Roman or other known influence. In Dumbuck, however, the objects found were, in an archæological sense, of less importance than the structure which contained them. Mr. DONNELLY naturally was anxious to have the opinion of men who were recognised authorities about the value of his discovery. Accordingly he sought out Dr. ROBERT MUNRO, who has made a special study of primitive remains, and invited him to Dumbuck. That gentleman has given an account of his visit in the *Glasgow Herald*. He says :—

> When I first visited the so-called crannog, by arrangement with Mr. Donelly, shortly after its discovery, I had no hesitation in recommending its exploration on the ground of the rarity of such structures in marine estuaries. Mr. Donnelly was very anxious that I should there and then pronounce it a real crannog ; but I pointed out that we had very little experience of marine crannogs in Scotland, that crannogs were habitations in fresh-water lakes or bogs, and that, although the wooden structures were disposed like those of the ordinary crannogs, we had as yet no evidence that they formed a place of habitation at all. The only analogous structure hitherto investigated was a cairn or mound of wood and stones near the island of Eriska, of which, however, though present at its excavation, I could not give any rational explanation. ("Proc. S.A. Scot." vol. xix, p. 192.) On my return home I sent Mr. Donnelly some literature on crannogs, and took the opportunity by letter of cautioning him against saying much about his discovery until its nature would be more clearly revealed by practical research. I was then leaving home to fulfil an engagement in England, and on my return, some three weeks later, the Dumbuck crannog was already famous. Descriptions and illustrations of the woodwork, the canoe, and a remarkable series of objects, were published in numerous journals. For some weeks I heard nothing more on the subject beyond second-hand rumours of extraordinary discoveries, till Mr. John Honeyman intimated a desire to have a consultation with Dr. Joseph Anderson and myself regarding the possibility of constructing a model of the Dumbuck crannog, for the purpose of being shown at the forthcoming exhibition at Glasgow. He was rather astonished to find that we had no information on the subject. Mr. Honeyman very kindly agreed to make arrangements for another visit to Dumbuck, in conjunction with some members of the Glasgow Archæological Society. Accordingly, a few days later I had the pleasure of joining a party of gentlemen who, like myself, were anxious to see the famous crannog ; and among the party were Mr. Adam Millar, F.S.A.Scot., and Mr. John Bruce, F.S.A.Scot., who along with Mr. Donnelly superintended the excavations. Mr. Millar had in his possession a case containing some of the exceptional relics already discovered, including a large spearhead like a winged arrow point, made of slate, a rudely-formed human figure manufactured out of a piece of shale, and a number of other objects of stone or shale perforated and ornamented with incised patterns, small cup-marks, concentric circles, &c. The discussion in the railway carriage on our way to Bowling centred on the theory that these objects were the relics of a pre-Celtic civilisation. Readers may fancy the astonishment of the party when I unceremoniously suggested an alternative theory, viz. that they were products of the nineteenth-century civilisation.

Much is said in railway carriages which is merely intended to while away the tedium of travelling, and the speakers would not care to repeat the conversation elsewhere. But Dr. MUNRO in this case put forth his theory in all seriousness as the most rational solution of a problem. On visiting the crannog he examined with care the objects discovered, and the impression they made on him can be judged from what he says:—"I pointed out that the osseous remains were the most important of the finds, as it was to them we had especially to look for evidence of the age of the dwelling, and recommended that a selection of them be at once sent to a specialist to be reported on. As for the stone weapons and the other relics in the case I ignored them altogether, stating that in my opinion they were not productions of the people who constructed and inhabited this strange place."

It was no wonder Mr. DONNELLY was depressed by the words he heard. But Dr. MUNRO, while giving him due credit for the judicious way in which the excavations were conducted, said he was convinced there was some mystification at work which it was his duty to explain, and suggested that a committee of experts be appointed to inquire into the matter, &c.

A committee of that kind is not easily organised, and that may explain why the suggestion has yet to be adopted. Dr. MUNRO, however, apparently considers there is now less need for the appointment, since further evidence is forthcoming which supports his theory of the modern origin of the relics found in the crannog. The relics which were obtained in the hill fort at Dunbuie are now in the Edinburgh Museum, and the doctor says the merest tyro in archæology must recognise their similarity and parallelism in form, style and ornamentation if compared with those found at Dumbuck. They are not only, he says, products of the same civilisation, but of the same artists. For the artistic character of the humblest things cannot be overlooked. Dr. MUNRO is sarcastic about that quality. "For these pre-Celtic folks," he says, "were very artistic in their ways, ornamenting everything, even their spearheads. But artistic genius is not a new element in archæology, for long before the pre-Celtic period in Scotland the caves of the Dordogne were inhabited by a race of hunters whose carved works on ivory and bone excel even those of the shale workers of the Clyde. But perhaps, as both are pre-Celtic, the latter may have been descendants of the former, and may thus have acquired their artistic tastes and skill through heredity." The spearheads being made of slate or shale could not have been intended for use as weapons, and were probably employed for decorative purposes, as were the figurines, amulets, playthings, &c. Dr. MUNRO's conclusion therefore is that "either these objects are what the investigators

assert them to be, the genuine relics of the inhabitants of the fort and crannog, or they are not. On the former hypothesis we have before us the most remarkable collection of archæological remains ever found in Scotland. On the latter, they are the productions of some idle, practical joker."

That a great many forgeries have found their way into museums as genuine antiques is notorious. They range from flint weapons to bijouterie by CELLINI. The nineteenth century, as a consequence of its method of education, idolises the past, and has become the most imitative of all ages. But the question must arise, Would the forgery of such objects as were found at Dumbuck and Dunbuie be worth the necessary trouble? The famous "Jim the Flintman," who found so much favour with students of the Stone Age, with all his ingenuity was never able to rise above the condition of a tramp. Celts became so abundant the supply exceeded the demand, and it was far more profitable to break stones at the roadside than to manufacture primitive weapons. The market for crannogs and their débris is a very restricted one, and the buyers are not wealthy. For those objects there are no ROTHSCHILDS. To make archæologists the victims of a practical joke is an old device. We hear of one in "Martinus Scriblerius," in "The Antiquary," and in "Pickwick." But when the jokes require much labour, as would be the case at Dumbuck and Dunbuie, the perpetrator becomes more absurd than the intended victim. On the other hand, the mere novelty of relics is not an argument against their genuineness. It would be absurd to suppose we are thoroughly acquainted with antiquity. The figures of reindeer which were found at Dordogne and elsewhere were treated as forgeries, and that sort of judgment was to be excused, for the rude sketches confounded many learned theories about the origin of art and its derivation from conventional lines. The same experience was repeated when the trinkets from Hissarlik were unearthed. To say then that because there is some novelty about the Dumbuck and Dunbuie objects they are necessarily pseudo-antiques is hardly warranted. They may be what Dr. MUNRO describes, but archæology has no infallible rules to settle the difficulty.

Mr. DONNELLY is not able to fence with so nimble-wristed an opponent as the doctor, but there is no reason to suspect his sincerity throughout. In his reply, which appeared in the *Glasgow Herald*, he described his position in the case as follows :—

I do not put myself forth as an authority. I never have done so. I have tried as an artist, not as an antiquary, to give a faithful record of all I saw with both pen and pencil, to protect at all cost the discoveries and finds from destruction and to carry out the valuable and kindly suggestion of Dr. Anderson, of the Edinburgh Antiquarian Museum, "to carefully keep and produce all finds, even though at the time they might be the subject of adverse criticism and appear of little value; the time might come when their value would be assured." This advice I have done my best to carry out. From the very first I have given every attention and afforded every facility in my power to those ladies and gentlemen who have expressed a desire to visit and examine the crannog. In many cases they had the excavations in their own hands whilst they were there. Dr. Munro was no exception to the rule. I am courting the strongest search-light that can be flashed upon the crannog, and the fullest disinterested investigation of all points in dispute.

Other correspondents have taken part in the fray, such as Mr. ANDREW LANG, Mr. MILLAR, &c., and, of course, the personal element could not be excluded. But no individual, however angry or supercilious be may become, can get over the difficulty. It is one which is worth an inquiry before several representatives of archæology, or let us say a Court of Cassation for the science. If after much labour the relics were found to be shams, the process of investigation which led to that result would be beneficial in other divisions of archæology. One class of objects found in the crannog is, however, outside the knowledge of the majority of archæologists. We refer to the organic remains. Some fragments of bone are believed to have belonged to the horns of the fallow deer. According to Professor BOYD DAWKINS that kind of deer was introduced in this country about 55 B.C. It seems hardly credible that at so late a period crannogs were in use, but a decision about the character of the antlers would help to settle the doubts.

EXHIBITION OF LITHOGRAPHS: ENGLAND.

A PICTURE-DEALER would say the exhibition of the loan collection of lithographs in one of the sheds of the Science and Arts Department at South Kensington exemplified the necessity of having a suitable gallery whenever works of art are to be seen. If the lithographs were transferred to one of the Bond Street galleries their interest would be augmented. At present few visitors who wander from the gallery of models of machinery into the bleak annexe containing the lithographs care to remain there; a glance at a few examples appears to be sufficient, and they go elsewhere in search of instruction or amusement. Yet there can be no question of the importance of the collection. There are over 2,300 plates, and hardly one among them is without some claim on our attention. Since about seven hundred artists belonging to Great Britain, France, Germany, Italy, Spain and America are represented, it is needless to say there is not only a great variety of subjects, but of modes of treatment. With all the liberality shown by lenders, not one scrap has however been obtained which was produced by the hand of the inventor of the process, ALOYS SENEFELDER.

It was in 1796 that his first sheet of lithographic music was printed, and in 1800 he took out a patent. Whether the "polyautographic" process which was employed in England in 1802 was an independent invention is not clear. The prints exemplifying it at South Kensington appear to have been produced from drawings made on paper, whilst SENEFELDER drew directly on the stone. It is certain that able artists were attracted by the polyautographic process. BENJAMIN WEST, P.R.A. (the catalogue-maker with characteristic Departmental ignorance styles him "Sir BENJAMIN"), JAMES BARRY, R.A., HENRY FUSELI, R.A., T. STOTHARD, R.A., Sir R. K. PORTER, SINGLETON, the CHALONS, W. H. PYNE, T. BARKER made drawings which were reproduced. But it is worth noting they were all by the pen, and consequently we may suppose chalk or coloured drawings were beyond the power of polyautography, which apparently resembled some of the processes still employed in offices for manifold copies.

VARLEY'S fishing-boats and cottages, dated 1809, also appear to be taken from drawings with a coarse pen, and so is JOSHUA CRISTALL'S "Apollo and the Muses," a large plate in the French style of the Empire. But the portrait drawn by B. R. HAYDON in 1816 is more like a chalk drawing. It has a fineness of touch which is not common in the small sketches or big paintings of that unhappy artist. By CHARLES HULLMANDEL, whose family name is closely connected with English lithography, there are several views, dated 1818, which were evidently chalked on stone. HENRY CORBOULD'S drawing of CHANTREY'S Monument of the Sleeping Children in Lichfield Cathedral (the designer was T. STOTHARD) shows the uncertainty of handling which is to be expected with a novel process. For the majority of people the most pleasing print of that remote time will be the invitation "card," measuring 16 inches by 12½ inches, for an exhibition at a girls' school. It recalls the grand days at Miss PINKERTON'S Academy for Young Ladies in Chiswick Mall, an institution immortalised by the patronage of Dr. JOHNSON, Mrs. CHAPONE and Miss BECKY SHARP. The figures of the children engaged in the study of globes, maps and other scientific objects might have been drawn by STOTHARD. The card is suggestive of the early connection between business and lithography, which was not always serviceable to art. A plate by E. BLORE, "The Strangers' Hall, Canterbury," which in reality represents the beautiful little Norman staircase, shows shafts much more attenuated than those which are now to be seen. A view of Hanover Terrace is attributed to no less an artist than JOHN FLAXMAN, R.A., but it is unlike all his known drawings. WILLIAM WESTALL, A.R.A., who was a great traveller, and who had produced many illustrated works, appears to have taken up lithography, and his plates suggest the suitability of the process to his style. There are also excellent portraits of MALIBRAN and SYDNEY SMITH by WILLIAM SHARP.

A portrait of Miss CHESTER in the character of BEATRICE, by A. E. CHALON, R.A., dated 1823, is the earliest example of the Anglo-Swiss artist whose sketches of actresses and opera-singers were at one time among the delights of Bond Street loungers. This drawing is by himself, and shows a

conscientious treatment which was afterwards abandoned when he prepared sketches for R. J. LANE to put on stone. The later examples are suggestive of evanescent celebrities, and are more in the modern French manner. LANE was the only lithographer who was able to force his way into the Academy, for he was elected an associate engraver in 1827. He was an admirable translator of other men's work into black and white, and suggested the styles of a great variety of artists—LAWRENCE, WILKIE, LANDSEER, WINTERHALTER, MULREADY, LESLIE, JOHN MARTIN, &c. His plates were generally small, and for that purpose the stones were "fine grained." From the smoothness it might be assumed LANE wanted vigour. What he sought was to avoid apparent coarseness, which was not in favour with his patrons; they would only look at superfine plates, and he supplied them. A year or two earlier than LANE lithography was taken up by SAMUEL PROUT. It was exactly the art for which he was adapted. He had made drawings to be engraved under BRITTON'S direction, but copperplate work was not suited to PROUT, and he was dismissed. The engravings from PROUT'S drawings in "Annuals" want the "go" of his lithographs. He was a forerunner of the Impressionists, and his views are not to be superseded by photography. Where a difference has to be admitted between the two, judgment is grudgingly given in favour of the sun pictures. It must, however, be owned he was indifferent to detail. An exhibition of all PROUT'S lithographs would leave little room for those of other artists, and at South Kensington we must be satisfied with fifteen plates.

There is double that number of J. D. HARDING'S plates. He was more versatile than PROUT, and he could draw trees and boats as vigorously as buildings. But his drawings have not as much individuality as PROUT'S; in style they resembled those of the ordinary drawing master, only they displayed more practised skill. HARDING lithographed a few of R. P. BONINGTON'S drawings, and some Frenchmen were employed on others. But the painter also drew on stone, and the examples in the loan collection have the simplicity and charm which are found in his water-colours. THOMAS BEWICK for once tried his hand in lithography, and the plate showing a rider on a rainy day is more curious than successful. T. S. COOPER, now the veteran Academician, sixty years ago was not too proud to lithograph the drawings of amateurs such as J. R. PLANCHÉ, who was herald and dramatist. WILLIAM WYLD, like BONINGTON, was more at home in France than in England, and his plates of views in Paris are the most satisfactory representation of the city as it appeared in the thirties. JOSEPH NASH'S "Mansions of England"—especially the copies which were hand coloured—gained attention on the first appearance of the work. It was not perhaps acknowledged how much the old architects were entitled to a share of the success. Not many of the plates are exhibited, but they will serve to suggest the style of NASH, who was uniform to a remarkable degree in the quality of his work. A couple of plates of the Alhambra show the delight of J. F. LEWIS in treating the details of Eastern art. FREDERICK TAYLER, the animal painter, was another successful lithographer, and his plates are sure to excite more interest than those from LANDSEER'S pictures. Lithography is not much favoured by sculptors, but ALFRED STEVENS'S "Sculptured Pediment of St. George's Hospital" could not be surpassed by the most dexterous draughtsman on stone.

Although painters can produce plates which are beyond the efforts of men who restrict themselves to lithography, yet the latter are not to be overlooked in any survey of the art. PROUT, LEWIS and BONINGTON were to be excused if at times they grew wearied and were unable to concentrate attention on all parts of a large plate. Hence it is that so few copies of pictures are to be found drawn on stone by painters. THOMAS FAIRLAND, who died in great poverty about 1852, was an example of a draughtsman who performed excellent work as a copyist. Several of the lithographs after WILLIAM HUNT'S rustic figures were produced by him. He was no less successful with portraits after WINTERHALTER. His work is throughout of an uniform finish. But he never gained a tithe of the reputation for his portraits which was obtained by CHARLES BAUGNIET, for the latter preferred to drawn from life on stone. People like original work, and the most successful lithographs are those which are not derived from pictures. GEORGE CATTERMOLE was one of the artists who when he copied kept to his own drawings, and the eleven plates in the exhibition thus become genuine examples of his handiwork. The numerous and excellent plates by Mr. J. A. VINTER, on the other hand, hardly secure him the position he merits, for they are all taken from portraits, the majority from WINTERHALTER. There are, in addition, two of large size of plays in which CHARLES KEAN was the principal actor, but there never was a less heroic figure on the English stage, and the scenes therefore appear more comic than tragic. T. H. MAGUIRE and J. H. LYNCH were also excellent copyists.

If judged by the number of plates bearing his name, LOUIS HAGHE appears to be the most important representative of the English school. A jury of lithographic draughtsmen would, if the question were submitted to them, be sure to decide in his favour. He could not be considered as superior in figure-work, although a couple of early prints indicate some skill, for he avoided that class of work, but for buildings of all styles he was unmatched. He had the knack of producing effects which can only be obtained by study in printing offices. LOUIS HAGHE preferred to work from his own drawings, but such plates as those in DAVID ROBERTS'S "Holy Land" are evidence of his loyalty as an intermediary between an artist and the public. There are no better exemplars of thoroughness in the exhibition than his plates. The skilful hand of JOHN GILBERT can be discerned in some of the figure-pieces attributed to others, but his name is attached only to the ten plates he prepared to illustrate English history. The aim was to give a sheet to the events of each reign. The figures had therefore to be on a small scale, and if the artist trusted to chalk alone would appear flat. GILBERT therefore employed pen strokes in order to gain definiteness. The combination of two modes of treatment is not altogether warranted, but no doubt he supposed he could exercise as much liberty when working on stone as when combining opaque and transparent colours in a water-colour drawing.

The largest plate in the exhibition is the portrait of the QUEEN in coronation robes, by C. FÜHR, which measures 73 inches by 46½ inches. It was not printed apparently from one stone, or on one sheet of paper, but the difficulty of "matching" and joining the different parts makes the *tour de force* more extraordinary. Although it dates from 1856, it may be considered as the climax of a class of lithography. The new school has renounced the principles which inspired FÜHR'S portrait and many earlier works. It is no longer considered imperative to work up to the margin or squaring lines. CHALON, as we have already pointed out, anticipated a departure from the old system. The change which has taken place is due to several causes, but the most important is one of material. The old lithographers worked on stone; a plate could therefore be kept in hands for a long period. FÜHR'S portrait must have required several months for completion. But as transfer-paper is now substituted for stone, the drawing has to be executed with more expedition. As a consequence such plates as Mr. VINTER'S scenes from "King John" and "The Corsican Brothers," or HAGHE'S "Destruction of Jerusalem," are no longer to be obtained, for before so much elaborate work was completed on paper a part would be defaced. Lithography, therefore, is now assumed to be a process for quickly producing several copies of a sketch. That theory was adopted long ago by "H. B." when he devised his political caricatures, for their point depended on appearing, as it were, on the spur of the moment. No other process would have answered so well. The Department of Science and Art have ignored JOHN DOYLE'S work, although admitting the sketches of French caricaturists.

The principal representative of the new school in this country is Mr. WHISTLER. There is no living artist who can more skilfully adapt his treatment to material, and if he were asked to prepare a sand picture, like those to be seen in the old-fashioned taverns of seaports, he would, we are sure, produce one which would be not only novel but appropriate. His twenty lithographs were manifestly drawn on paper, and not on stone. There are no deep shadows, no pre-Raphaelite detail. Each suggests what was seen at a glance, and recorded with expedition. To the artist him-

self the lines may recall more than is shown in the sketch, but how far the lines affect a stranger who has to depend on the sketch as evidence will, of course, depend on the aptitude of the individual.

We can observe a great many of the efforts to catch the CYNTHIA of the minute which were made at sketching clubs and elsewhere. Mr. G. F. WATT, Mr. STOREY, Mr. SOLOMON, Mr. A. PARSONS, Sir J. D. LINTON and several other artists have found pleasure in a multiplication of their sketches. M. LEGROS has several of his fine portraits, which would deserve attention if it were only on account of the absence from them of all pretence of having been drawn in a hurry. But is it quite fair to treat the artist as English? It is the French section which should have the credit of his work and of some other artists as well. The portraits of Mr. W. STRANG are less severe, but their realism must be commended. Mr. W. ROTHENSTEIN is another of the portraitists who find lithography is adapted to their manner of representation, and although the drawings show no indication of labour, they are truthful as likenesses. Mr. SHANNON has a light hand, and in his lithographs he does not confine himself to portraits. Most of the examples of the modern school, it should be remarked, appear to have been produced for the gratification of the artists. They do not pretend to be marketable, and if so, there is less necessity to impart to them those qualities which are supposed to be needed in all pictorial art. In other words, the plates are reproductions of studies which used to be kept for the artist's own use. Any one who is able to draw on prepared paper can have several plates produced which bear his or her name, and can claim to be a lithographer. Whether the value of the art is enhanced or diminished by the facility which can now be enjoyed by all who are able to hold a crayon we need not discuss.

SYSTEMS OF DISTRIBUTING AND GENERATING ELECTRICITY.

By F. J. WARDEN-STEVENS.

IN describing the systems of distribution it will be well to first call attention to the fact that electric lamps must be supplied at a constant pressure. If the pressure falls below that for which the lamps are made, the light falls off much more rapidly than does the energy used. If the pressure is increased above the standard the lamps soon fail. It is therefore essential that there shall be as little variation as possible in the pressure at which electricity is supplied.

In this connection the exact conditions affecting a cable may be stated.

The loss of pressure increases with the current passing and with the length, and it decreases as the area is increased. In other words, the loss of pressure is proportional to the resistance of the cable multiplied by the current.

The drop of pressure is, however, not the only question to consider; there has also to be taken into account the loss of energy. The loss of energy is proportional to the current multiplied by the drop of pressure. As the drop of pressure is proportional to the current, the electrical power wasted is proportional to the resistance of the cable multiplied by the current squared; thus if the current is doubled and the cable is kept the same the loss of power will be increased four times. Therefore, bearing in mind that the resistance of a cable is proportional to its area, that copper is expensive and that the loss in a cable is often as much as 20 per cent. of the total energy, it is obviously advantageous to reduce the current while increasing the pressure to as great an extent as possible, but the insulation of the cables becomes less reliable and more expensive as the pressure is increased.

Any system of distribution, as may be remembered from the previously considered question of mains, consists of distributors and feeders, and the length of the distributors from the source of supply must be as short as possible in order that the pressure is even. The length of distributing cable is reduced by supplying it at several central points from the generating works, so the length of the cable in which the drop of pressure occurs, instead of being the distance from the works, is the distance from the nearest feeding point.

The feeders are cables laid direct from the works to various points on the distributing mains. One feeder goes to each feeding point, and no current is taken from it except at that point. The pressure at which the current is generated at the works is above the pressure of supply to allow for the drop in the feeder, and the increase is equal to the loss; therefore at the feeding point the pressure is always kept constant.

It will be noted that the drop or fall of pressure is the important consideration in a distributor, and the loss of energy or power is of importance in a feeder.

Distribution.—The first system of distribution used was that known as the two-wire. With the two-wire system it is evident that the current will only be transmitted a certain distance in a given cable without a serious drop of pressure, and it is essential that in a distributor the drop shall be negligible. Therefore, the distributor must be either supplied at frequent intervals or the cables must be thick, or the current must be reduced by increasing the pressure, as the drop of pressure is proportional to the current.

Now by the Board of Trade regulations the greatest pressure supplied to any consumer is under 250 volts, and it is found impracticable for many reasons to go even as high as this.

The three-wire system was introduced with the object of doubling the pressure at which the current is generated and distributed, thus saving in capital outlay on the mains, while the pressure at which the consumers receive the supply is the same as with the two-wire system.

In this system three cables are used instead of two. The pressure between the middle one and each of the two outer ones is the standard, and that between the two outer cables is double the standard. On any group of lamps in the system the total number which may be switched on at once is divided so that approximately one-half of them are connected between one outer cable and the middle, and the other half between the other outer and the middle; this division of lamps is called "balancing," the middle cable being taken back to the generating works. The current will naturally go along the positive cable through the first group of lamps to the middle cable, and the middle cable becomes the negative. The middle cable is however also made the positive for the current leaving the works for the other group of lamps, the remaining cable being the negative. The result is that if the currents required on the two sides of the system are equal, the currents in the middle cable neutralise each other, and thus the middle cable carries no current. It will be seen that as the supply required on the one side of the system will as a rule approximately equal that required on the other, the middle cable needs only to take the slight difference between the two. Thus the two outer cables can be of the same size as if they were supplying at double the lamp pressure, as they only carry half the current, and the middle cable may be much smaller. The current being half that on a two-wire system, the pressure being double, the cables need be only quarter the area, allowing the same loss of energy. As the loss is proportional to the current squared, and therefore with the same percentage loss allowable, a given number of lamps can be supplied at four times the distance, using the same size cable, with the extra cost per mile of the thinner middle cable.

The feeders in a three-wire system consist of two cables only, connected to the outers of the distributing mains, the middle or balancing cable of the distributing mains being brought back to the works.

Instead, however, of bringing the middle cable back to the works, it is sometimes convenient to place a "balancing" arrangement in a sub-station. This balancer consists of two dynamos coupled together, one running on each side of the system, and they are placed at the feeding points, thus obviating the necessity of running the third cable back to the works. The effect of this balancing is to equalise the current, taking the surplus of current from one side and transforming it over to the other side of the system, making

the current in the positive cable equal to that in the negative, and the current in the middle cable nothing. The feeders in a three-wire system may be designed for 440 volts say, and so be small, while the lamps are supplied at 220 volts. As before explained, a great saving in cost of mains is effected, while the lamp-pressure is not increased.

The five-wire system is similar to the three-wire, except that there are three balancing cables instead of one, and four groups of lamps instead of two. It is, however, seldom used, as it was designed at a time when 150 volts was the highest pressure allowed on consumers' premises.

A 100-volt five-wire system would have 400 volts total pressure, and the cables would be arranged for this. A 200-volt five-wire system would not be allowed, as the total pressure would be 800 volts, and 500 is the highest allowed. It is evident that a three-wire 200-volt system is the same as a five-wire 100-volt system, except that higher pressure lamps must be used and it is simpler.

It can thus be seen that the usual course is to adopt a two or three-wire system with electric lighting for distribution, keeping the feeders two-wire in every case.

High and Low Pressure.—There are two general systems of supply—the high and low pressure.

The low-pressure system may be described as that in which the current is generated at the works and supplied direct to the consumer. The Board of Trade limit, with a low-pressure system, is 500 volts on the mains and 250 volts on consumers' premises. In the case of this system the cables must be kept large, as previously explained, or the drop of pressure will be serious. As the loss of energy is proportional to the resistance, there is a limit to the extent to which the system can be used, as outside a certain radius either the cost of mains becomes prohibitive, or the loss of energy is excessive.

The high-pressure system is one in which the current is generated at a pressure higher than can be used in consumers' premises with safety, and it has, therefore, to be transformed down to within the limit allowed by the Board of Trade. As the cost of the transforming apparatus is a considerable proportion of the total cost in this system, it is evident that, for supplying electricity a short distance, the cost of the transformers alone might be more than that of the low-pressure mains for the same distance, while for supplying a long distance the cost of transformers would be quite small compared with that of the mains. There is a certain distance in which the cost of the high-pressure mains and transformers equals that of the low-pressure mains. The question of the distance of the generating works from the area of supply here presents itself, and although it affects the feeders only it is of great importance.

It is always preferable that the site should be as near to the centre of the area of supply as possible, as the cost of cables is reduced and the efficiency increased; but to obtain this it is often necessary to use expensive land and to sacrifice convenience. As to exactly how much it is advisable to sacrifice capital outlay and convenience to the condition of a central situation, this can only be settled by the engineer for each particular case.

With a high-pressure system of distribution, the transforming apparatus may be arranged in several ways, and the standard arrangements are :—

(*a*) The transformers may be placed at the feeding points, in which case the distributing mains will be low-pressure and the feeders high-pressure. This is called the sub-station system.

(*b*) There may be high-pressure feeders and distributing cables feeding a low-pressure network at many points, usually by isolated transformers in small chambers underground. This is known as the street-box system.

(*c*) Also there is a system in which each consumer is supplied direct by means of a transformer, all the mains being high-pressure. This is called the house-transformer system.

These systems are arranged in the order of their efficiency, the first cost being left out of consideration.

Any system in which transformers are used involves a constant loss of energy, whether current is being used or not, and for this reason it is often economical in the end to incur a greater capital expenditure on mains and generate electricity at the same pressure as that at which it is to be supplied. Large transformers are more efficient, and proportionately cost less than small ones, and this is the chief reason why the house-transformer system inevitably develops into the street-box or the sub-station system. Larger and fewer transformers can be used, and greater economy can be obtained.

(*To be continued.*)

DURAZZO.

A CORRESPONDENT of the *Glasgow Herala* gives the following description of the ancient town of Durazzo in Albania :—

Durazzo consists of one long, narrow street, extending from the Porta Marina to another gate opening into the bazaar and the country, and of many side streets running up to the citadel and to the walls which circle the town. The walls and towers are fast crumbling away. They are in the Venetian style of long, hard brick finely cemented, with dressed stone on the battlements. So great is the dilapidation that one would think avalanches of brick and lime had fallen at several places. Outside the walls landward the ground is occupied by cottages, clinging to the sides of glens, and cemeteries with turbehs (saints' tombs) and fountains. The plain beyond is very marshy, often overflowed by the sea, and many acres of it are divided into salt-pans. Great heaps of rejected salt look like white pillars at a distance, gleaming in the sun—so many remembrancers of Lot's wife. But little is left to tell how great an antiquity was here. Several large marble pillars, solid round blocks from 4 feet to 10 feet high, stand or lie in the bazaar, before the Dogana on the quay and elsewhere, and many pure white marble slabs are built into walls or on staircases. At the top of the main tower by the sea some beautiful capitals lie about, and one stone in particular stuck into the masonry of an embrasure arrested my attention. It is broken at one end and worn with age, leaving only these letters traceable—

RISSIMA LVCILA AVRELIVS

Doubtless we should read Carissima Lucilla, Aurelius Antoninus. What an insight may not this fragment give into the deep heart of the "philosopher" emperor, Marcus Aurelius Antoninus. Lucilla was the name of his mother, and also of that wayward beauty his daughter (whom he had to sacrifice to that brute Lucius Verus, Emperor of the East), and this may well be part of a memorial of woe for one or the other of them erected in some tender mood when starting on one of his Pannonian campaigns and thinking out his beautiful "Meditations." Perhaps the two most remarkable stones (if the above one be only conjecturally read) are those built in at the foot of the left jamb of the ancient gateway (where the great Via Egnatia began, the other end being Constantinople)—one showing a centaur, and the other a cuirass, quiver, a headless man prostrate, an angel, and a man with averted face—evidently some Christian idea grafted on to mythology. Occasionally a marble capital, beautifully flowered, is unearthed deep in the ground (for earthquakes and sieges innumerable have been changing the surface every other century). A head in a wall, a torso lying on the ground, a pillar here and there, their pure whiteness contrasting with the surrounding sordid meanness and measuring ages of degeneracy, show the former greatness, Roman or Greek, that once was here. The thin red bricks, the yellow cement, the towers, the crenelles, the moat, the guns lying among the ruins, beside boxes and barrels of modern use, and under the walls where they have been thrown over centuries ago a large defaced winged lion, show another greatness, more recent, but likewise vanished, that of Venice. Normans, Serbs, Venetians, Franks and Turks have manned these lofty walls, over which now the noisy jackdaws wheel in flocks, the wild fig trails its branches, or some modern house rears its ignoble front. Along this mole facing the Adriatic, where now the tall, slender canes wave in the breeze, Cicero in his exile may have paced, homesick for Rome and the Forum, composing those excruciatingly broken-hearted letters of his to his wife Terentia and his friend Atticus. Through this hollow courtyard (where among the lumber one of those fine deep wells that Venice loved to make and the Turks to imitate still raises intact its cup-shaped marble top) the men-at-arms must have often crowded under the gloom of this archway, up these winding stairs to the ramparts of the tower, to meet the head of the assault from the sea. Here an uninterrupted view is obtained south and west and north over the Adriatic. The great molten globe of the setting sun was glittering and glowing and dancing tremulously on the waters as it sank rapidly lower and lower—*Splendet tremulo sub lumine pontus*—growing darker and darker red, until suddenly, before one could speak of the fact, the last bit of arc vanished below the horizon, setting the clouds around it on fire, and throwing reflections, long iridescent lines, like streets in heaven, across the far eastern sky. They faded one by one, but for awhile hovered in deeper lurid streaks above the Khimara, as if lingering to light up the

gloom, "thrice darker than night," that enshrouds the entrance to Tartarus somewhere there among its thunder-haunted clefts. Standing on that tower above the sea till the stars came out, rich and liquid, hanging like lamps, and reflecting themselves so as to make another celestial vault of the bay, I began to appreciate the mood that made wise and sensible men of old believe in the positive reality of those glowing old legends and myths founded on nature's processes.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at 9 Conduit Street, Mr. E. A. Gruning, vice-president, in the chair. Messrs. G. Hornblower and H. H. Fox were elected fellows. The chairman read the following awards of prizes and studentships for 1898-99:—

The Institute silver medal and twenty-five guineas for the best essay on "The Use and Value of Colour in Architecture," awarded to Mr. H. C. Corlette.

The Institute silver medal and ten guineas: Subject, measured drawings of ancient buildings in the United Kingdom or abroad, to Mr. Henry Ernest Kirby. Medals of merit and five guineas awarded to Mr. Heaton Comyn and E. F. Knight.

The Soane medallion and 100*l.* (for continental travel), for the best design for a concert hall to seat 2,500 persons, was secured by Mr. William A. Mellon, who submitted eight strainers.

The Pugin Studentship: Silver medal and 40*l.*, for the promotion of the study of the Mediæval architecture of Great Britain and Ireland, attracted the largest and finest number of drawings on record. Mr. J. Hervey Rutherford gained the first medal. Mr. E. H. Bennett was awarded a medal of merit and ten guineas; Mr. Ramsay Traquair, of Edinburgh, medal and five guineas; and Mr. Albert Herbert certificate of honourable mention.

The Owen Jones Studentship: Certificate and 100*l.*, founded for the encouragement of the study of architecture, more particularly in respect to ornament and coloured decoration, was gained by Mr. John Stewart, of Bridge of Allan, N.B.

The Godwin Bursary: Silver medal and 40*l.* Mr. E. W. N. Wonnacott, the only applicant, received the award.

The Tite Prize: A certificate and 30*l.* Subject, design for a royal mausoleum. This award for the younger members of the profession attracted but eight competitors. The four strainers by Mr. James B. Fulton gained the award, a medal of merit and five guineas to A. J. Gardner, and a certificate of honourable mention to Mr. E. T. Jago.

The Grissell gold medal and ten guineas, open to British subjects who had not been in professional practice longer than ten years. The subject was a design for a fruit, flower and vegetable market for a small provincial town. The award was gained by Mr. G. Gardner Wallace, who sent in three strainers; a certificate of honourable mention was granted to Mr. C. A. Daubney.

The Ashpitel Prize.—The board of examiners (architecture) reported that none of the successful candidates in the final examinations of 1898 had distinguished themselves sufficiently to deserve the prize, value ten guineas, but the Council awarded a prize of five guineas to Mr. Charles Riddey and Mr. John Kirkland respectively.

The Arthur Cates Prizes.—Books to the value of 10 guineas, offered by Mr. Arthur Cates, ex-chairman of the board of examiners, to the students whose testimonies of study for admission to the final examination were considered by the board to best merit the prizes provided they passed the examination for which the said testimonies were submitted, were awarded to Mr. Albert Herbert, of Leicester, for the June examination, and to Mr. H. Inigo Triggs, of London, for the November examination. An extra prize of 5 guineas was awarded to Mr. Henry Tanner, jun., of London, for his testimonies of study submitted for the latter examination.

At the conclusion of the awards Mr. Lacy W. Ridge moved the following resolutions with regard to building by-laws:—

1. That the administration of local building by-laws in rural districts is a matter calling for the action of the Royal Institute.

2. That the Council be requested to communicate with the Local Government Board on the subject, and to appoint a special committee to consider and take action thereon.

Mr. Ridge suggested that the Local Government Board should be approached on the matter, their consent being necessary to any local by-laws. The Council might then persuade the Local Government Board to draw up a series of by-laws applicable in the one case to towns and rural districts.

Mr. William Woodward seconded the proposition, and was supported by Messrs. J. Douglass Mathews, Owen Fleming, E. Woodthorpe, E. G. Dawber.

Mr. Gordon Smith said he was sure the Local Government Board would receive any recommendation that might be suggested with the utmost consideration.

On a show of hands the resolutions were carried unanimously.

The meeting, which was poorly attended, then terminated.

THE SITE OF THE OLD STAR CHAMBER.

THE task upon which Sir Reginald Palgrave has been engaged for several years, of localising for the benefit of visitors historical memories associated with the Palace of Westminster, will be brought to a conclusion next week, when a tablet indicating the site of the old Star Chamber is to be placed in position in the arcade connecting the Houses of Parliament with the Westminster Station of the District Railway Company. The tablet, which will be affixed to one of the wall-piers of Sir Reginald Palgrave's residence midway between the two archways giving access to the Speaker's Courtyard, bears the following inscription:—

"This tablet marks the position of the outer doorway, leading to the room, built during the year 1602, wherein the Court of Law constituted by Statute, 3 Hen. VII. c. 1, known as the Star Chamber Court, held session during the reigns of James I. and Charles I. until August 1, 1641, when the Court was closed by Statute, 16 Car. I. c. 10.

"The position of the doorway was ascertained by measurements based upon ancient plans of the Palace of Westminster. The frontage of the Star Chamber building extended about 30 feet northward and southward from this spot. The Star Chamber was upon the first floor, and was lighted by windows looking towards New Palace Yard."

In determining the location of the Star Chamber, which, it may be recalled, survived the great fire of October 1834, but was pulled down in 1836 to make way for the present building, Sir Reginald Palgrave, according to the *Times*, drew his inspiration from three sources—first, a view of the interior of the Star Chamber contained in Brayley and Britton's "History of Westminster Palace," plate XX.; secondly, a drawing by Mr. W. Capon, published in a report from a select committee on Westminster Hall Restoration; and, thirdly, a drawing of the exterior of the Star Chamber, made in 1832 by Mrs. Lefroy, the daughter of Mr. Rickman, who, as clerk assistant of the House of Commons, occupied the adjoining residence. The exact position of the doorway was ascertained by Mr. Jones, the clerk of the works to the Houses of Parliament, by measurements starting from the eastern tower of Westminster Hall upon the lines of two old plans of the Palace of Westminster, one made by Mr. Capon between 1793 and 1823 (now in the British Museum), and the other published by Mr. Smith in 1807 in his "Antiquities of Westminster." The Star Chamber itself was on the first floor, almost exactly in the position now filled by Sir Reginald Palgrave's drawing-room.

SCOTTISH MANSIONS.

ON Monday night Mr. James Chalmers, I.A., read a paper entitled "The Mansions of Scotland" at a meeting of the architectural section of the Philosophical Society of Glasgow. Mr. P. Macgregor Chalmers presided. The lecturer dealt more particularly with the works of the late David Bryce, R.S.A., Edinburgh, who erected about fifty of our Scottish mansions. The work of Bryce, he said, contained all that was good in that of Adams and his other contemporaries, and in the opinion of Mr. Chalmers none of the mansions erected since Bryce's death excelled, if they even equalled, that of Ballikinrain and Castlemilk, which represented possibly the finest Scottish baronial buildings; or Langton Grange, near Duns, which illustrated his Elizabethan mansions. Mr. Chalmers then gave illustrations of the castles and mansions from which Bryce received much of his inspiration, and gave many interesting reminiscences of his life and character. He concluded by making a comparison between Ballikinrain and Bute House, the latter of which might be considered not only one of the most modern, but one of the most pretentious of our recent mansion houses. At the conclusion of the lecture Mr. Chalmers receiced a hearty vote of thanks.

A Meeting of the Metropolitan Asylums Board was held on Saturday, when a discussion took place on an adjourned motion brought forward by Mr. Brass at the meeting of the Board on June 18 last to the effect that the works committee be instructed to consider and report if it would not be advisable to appoint an architect to the Board. Ultimately an amendment was agreed to referring the matter to the works committee, "with instructions to consider and report whether it is desirable for the Managers to appoint an architect or surveyor, or architect and surveyor, and, if so, on what terms and conditions, and for the performance of what definite duties."

NOTES AND COMMENTS.

M. ALPHAND, the director of works in Paris, had charge of nearly all the undertakings on which the rates were expended. On his death his responsibilities were divided. Everything connected with the supply or employment of water eventually came under the charge of M. HUMBLOT. On Friday last he died rather suddenly, and the municipality of Paris has lost in him one of its ablest engineers. It was under his direction a new supply of water was obtained, and arrangements were in progress to obtain another. He was ever ready to give his aid to the city. When there was a difficulty about the construction of the Metropolitan Railway, he offered to undertake the work, and if he had there could be no doubt about his success. In preparing Paris for the coming of strangers in 1900 M. HUMBLOT'S assistance would be invaluable.

THE Rue de la Colombe is one of the streets on the north of Notre Dame, Paris. The name is supposed to be derived from a signboard. The street is ancient, and up to 1792 contained a chapel which was founded in the twelfth century. It is, however, connected with a far more remote time. That fact was demonstrated in the course of the excavations for a large building which is in progress. It was found that remains of a wall constructed of immense stones still existed, and as similar blocks were found while laying sewers, it was concluded that the parts belonged to the same wall. In fact, the workmen had come upon the fortification of the original Cité. Some of the stones bore letters which were parts of inscriptions, while others displayed fragments of sculpture in relief. The conclusion is therefore warranted that the stones of a Roman building were used for the wall which was probably constructed in the third century. It is impossible to say with any certainty in what direction the wall ran after leaving the part now known as the Rue de la Colombe. In the garden of Notre Dame an excavation has revealed a wall at a depth of 16 feet below the surface, but the character of the masonry is different, and must belong to a later age. Scanty as is the knowledge afforded by the inquiry, it brings credit to the Municipal Council that is always on the alert in order to utilise every new foundation as a means towards a revelation of the ancient conditions.

ALTHOUGH there was often a display of littleness on the part of NAPOLEON I., as an individual he appears to have exercised an influence over officials which made them aspire to grandiose effects. The foundation memorial of the building on the Quai d'Orsay, Paris, which was known as the Cour des Comptes, is an instance of the spirit that animated so many things at the beginning of the century. A bed of hard wood was found in which twenty-nine hollows were formed to receive medals and coins. In the midst was placed a portrait of the Emperor in enamel. Around were medals commemorative of the following events among others :—The Treaty of Peace at Tilsit, the erection of the Arc du Carrousel, the marriage of NAPOLEON and MARIE LOUISE, the Confederation of the Rhine, the erection of the Vendôme Column, the Establishment of the Civil Code, &c., with various examples of the coinage of the Empire. It was not anticipated that the memorial would be revealed within so brief a period as ninety years when the medals and coins had not ceased to be familiar, but we can at least imagine the effect they would produce after a few centuries had elapsed. The building was originally intended by NAPOLEON to be the French foreign office, but he did not witness its completion, which was delayed until 1841.

A PAPER was read by Dr. RENAUD before the Lancashire and Cheshire Antiquarian Society on "Biddulph Hall," which is about the finest example in Staffordshire of a semi-fortified manor-house without a moat, built for comfort rather than for prolonged defence against organised opposition. Although in ruin, its *tout ensemble* showed a stately example of the sixteenth-century Renaissance architecture. When the Saxon thanes were dispossessed and WILLIAM I. proceeded to parcel out their landed possessions to his Norman followers, that district of Staffordshire was allotted to ORME DE GUIDON, otherwise known as "The Forester," of whom little practically was made manifest save that he acquired the ten manors of which Biddulph and Knipersley were two, and that he left four sons, whose names were given. The hall was built in the reign of ELIZABETH by FRANCIS BIDDULPH, grandfather of JOHN, who was its occupant and possessor at the time of the Civil War in the seventeenth century, when the Parliamentary forces under Sir WILLIAM BRERETON besieged and destroyed the house. An account of the church and its monuments was also read.

THE last number of the Journal of the Sanitary Institute recalls the services of the late Professor HAYTER LEWIS to the Institute. In 1882, it is said, he became a member of the Parkes Museum; he was shortly after elected on the council upon the incorporation of the Sanitary Institute and Parkes Museum; he remained on the council until 1892, when his failing health prevented his attendance. As a member of the Board of Examiners his services were much appreciated, as the council felt the importance of the architectural profession in connection with sanitation. Professor LEWIS lectured for the Institute, and contributed several papers to the Transactions. All who knew him will remember his kindly and genial disposition and ready helpfulness in all undertakings with which he was connected.

PSYCHOLOGISTS might well occupy themselves in an attempt to discover why the plasterers of London should be distinguished from the workmen of the other building trades by their obstreperousness, combativeness and other qualities which cause delays in building. For years past building firms have considered the plasterers to be a doubtful element which might explode at any time, and a danger to the most perfect organisation. There is consequently not much surprise at the threatened general strike of the plasterers. Three firms have already had to commence that ordeal because they would not compel some of their managers to join the plasterers' union. It is understood that the attack does not receive the approval of the other unions, and they would not show much common sense if they sided with so ill-advised and inopportune an effort to interfere with the course of business.

THE building regulations of New York were sharply criticised at a recent meeting of the American Society of Civil Engineers. Professor BURR pointed out the imperfect column formula used, which gives twice the strength the columns can possess. He would have cast-iron columns absolutely excluded from buildings, for if cast-iron and steel columns were made with the same factor of safety the steel would be found cheaper in every way. There were innumerable imperfections incident to cast-iron columns. The absence of supervision over details was the cause of dangerous and fantastic constructions. Mr. CUST said the building laws of New York originated when steel and wrought-iron members were unknown and cast-iron was considerably used for columns and girders. The law was intended to apply to five or six storey buildings, with a unit frontage of 25 feet or its multiple, and really answered very well for them and for speculative tenements, although entirely inadequate for modern high buildings. Mr. O'ROURKE considered a more perfect law could not have made the high buildings better. But the requirements for foundations did not sufficiently recognise the difference between soils, for there was no allowance in cases where the excavations were carried down to the rock. Mr. WAIT said he was in favour of entrusting the details of a design to the engineers and architects, without subjecting them to any more supervision than is exercised on physicians' prescriptions or the actions of other professional men. The effect of the discussion could not be said to help the cause of those who are seeking to amend the building laws of New York.

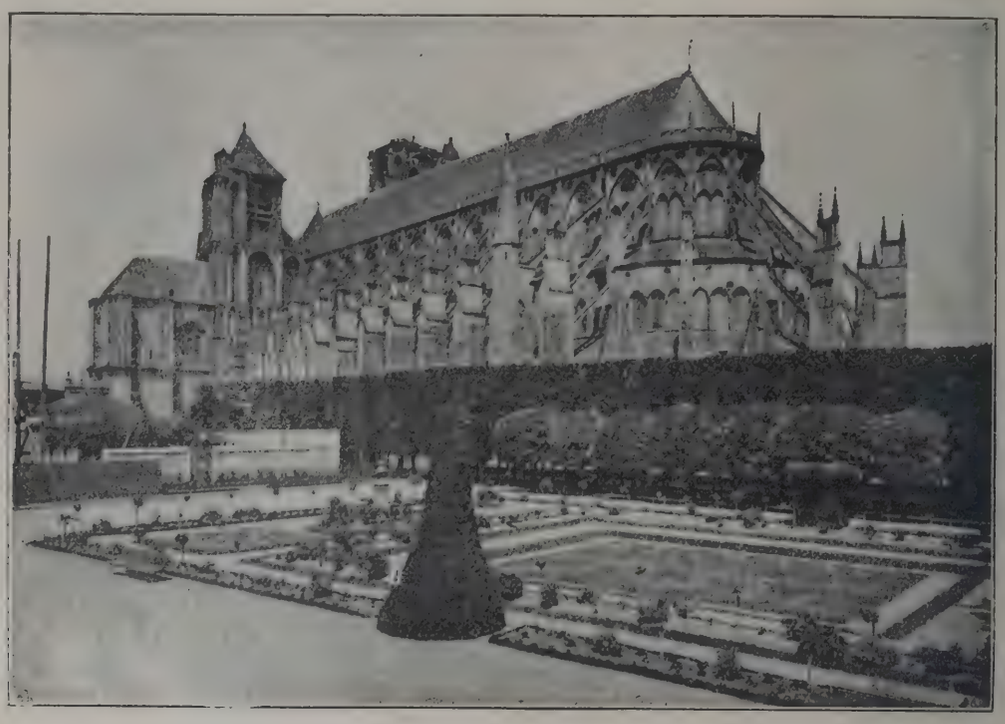
IX.

Tours—Bourges.

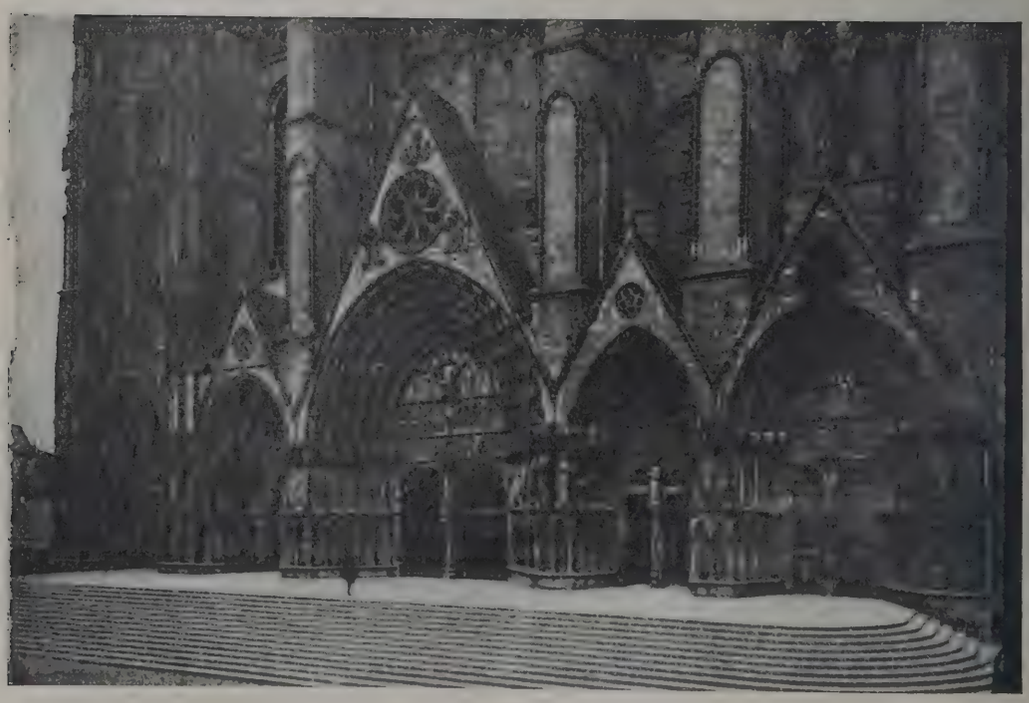
EARLY in the morning of Friday, August 11, we paid an enraptured and somewhat lengthy visit to the magnificent, but as yet unfinished, basilica of St. Martin. All that remains of this once far-famed abbey are the clock and Charlemagne towers. These noble towers, which formerly stood at the north-east and south-west angles of the nave, are now separated by one of the principal and busiest streets of Tours, which traverses the entire site of the nave. Beyond these steeples not a trace remains of this large and time-honoured church, which for the alleged reason of superfluity and needless expense was ruthlessly destroyed during the early years of the present century, having survived the shock of the Revolution.

In 1861 the rock-hewn tomb, believed to have been that of St. Martin, was discovered under a house which occupied the site of the high altar. Over this a chapel, and subsequently the present noble church, in the style of Angevine and Auvergnat Romanesque, have been raised. With the exception perhaps of the great church of Sacré Cœur which crowns the hill of Montmartre at Paris, this is perhaps the finest and costliest modern basilica France possesses. It is built in the form of a cross, the transeptal and eastern limbs being, however, very short, from which rises a dome surmounted by a figure of St. Martin.

The drum of this dome is lighted by a succession of small round-headed windows within pilastered arcades, and is enriched internally by a figure of the soldier bishop vested in a chasuble, and seated against a background of gold mosaic. At present only three bays of the nave have been completed. This portion of the church has a wooden roof gabled, but not very acutely, a clerestory of small, coupled, round-headed arches, and an arcade, also round, upon tall cylindrical columns of grey marble, with somewhat Corinthianising capitals. The workmanship here suggests the chancel which Sir Arthur Blomfield added to St. Peter's, Eaton Square, nearly thirty years since. At the east end of the nave a noble sweep of balustraded steps leads up into the transeptal portion beneath the dome. This space is chaired, and screened beneath the north and south transept arches by parcloses with pillars of grey marble, forming an arcade on either side a square-headed door. Some delicate stained-glass in the small round-headed windows of the transepts especially engaged our attention. Just under the eastern arch of the crossing are the Epistle and Gospel ambones, formed of the costliest materials, while in the simple but grandly sweeping apse, whose conch exclaims for pictorial enrichment is placed the high altar, its mensa resting on four marble shafts, and its predella exquisitely worked in mosaic, the pattern presenting vine leaves and birds on a gold ground. The six candlesticks stand in front of this predella, which supports a baldachin—a cusped and gilt arch on banded Corinthian pillars. Each transept opens eastward into a chapel, that to the north being dedicated to the Blessed Virgin, that to the south to St. Joseph. Altars of an equally costly description grace both these chapels, similar in many respects to the high altar. The pulpit, on the motif of the celebrated marble one at Messina, stands against one of the nave piers on the north side. Right and left of the steps leading up to the transepts from the nave is a short flight conducting down to the crypt, whose roof is sustained by thick red granite piers. Here is the great object of veneration—the tomb of St. Martin. The shrine, a species of twin-gable temple, with two rows of four columns, is raised on a lofty plinth inlaid with mosaics in bands. At the north and south ends gratings give a view of the tomb, before which a lamp is burning. Altogether, new St. Martin's is a superb piece of work, and one that atones, in some measure, for the loss of the Mediæval abbey.



Tours: Basilica of St. Martin and Tower of Abbey.



We have said good-bye to some pelicans, who had constituted an interesting item in the wonders of a Fair being held on the quais during our visit to Tours, and to an old magpie whose friendship we had secured by some fruit while taking the air in his wicker cage outside the toll-taker's lodge on one of the bridges; we have attended the chapter offices at St. Gatien's; we have transacted a little business at the bank, *i.e.* the changing of some of the coin of this realm of England into that of France; and now we are off by train to Bourges.

Beyond a slight altercation respecting the value of a small silver piece in exchange for a glass of—never mind what—with the proprietress of a café just outside the station of St. Aignan, where there is a halt of fifteen minutes while the engine goes off on some unknown errand, the journey as far as Vierzon (where you change carriages for Bourges) passes without incident. In this part of France the long, open third-class carriages are far superior to those of the rabbit-hutch kind with which we had become so familiar on the northern railways. The seats are cushioned, there is the additional luxury of a window on either side the door, and people hang their "baggages" on pegs from the roof all down the long open carriages, where they present at times some very odd combinations. A polite youth in a blouse assists us with our knapsack into the carriage at Vierzon, for, if you are equipped with one of those useful articles, the doors of French third-class compartments

being somewhat contracted, a crab-like mode of entering is requisite, unless you wish to stick fast *in limine*. The aforesaid polite youth, his *compagnon de voyage* and two ladies of an uncertain age, whose tongues, it is no exaggeration to say, never stopped once from their entry into the carriage at Vierzon until the debarkation of one of them at some village station a little further on, constitute our party. In the next compartment an old peasant woman, with a couple of fowls in a basket, has put up her umbrella to protect them from the afternoon sun.

Bourges Cathedral from the S.E.

Bourges Cathedral : Western Portals.

This is thought an exquisite piece of drollery, and as nobody can do anything in France without half a dozen others proffering their opinion upon it, everybody else leans over the partition of his or her compartment and puts in a remark. The polite youth and his mamma, or his aunt, or whoever she may be, then proceed to partake of some refreshment, whereupon he aforesaid garrulous lady, who has said good-bye to her companion, opens fire upon them, peradventure with the view of being asked to assist at the demolition of the savoury viands, but not being invited to do so becomes less communicative, subsiding by degrees into dignified silence. It is about half-past two when we catch our first glimpse of the great transeptless cathedral of Bourges rising at the summit of its city, seen athwart a rich tract of pastoral country intersected by willow-bordered streams inviting a dip, and of which we make a mental note.

At the Hôtel Jacques Cœur, where, on account of its historic appellation, we had decided upon taking up our quarters, we find ourselves to be the only guest, so that there is no lack of attention from host and hostess, who, with their two sons, evince the greatest interest in Monsieur l'Anglais and everything pertaining to him. The younger of the sons, one of Thomas Ingoldsby's "sharp little boys about twelve years of

age," is elated at the no distant prospect of being permitted to conduct Monsieur to the Musée and other "lions" of Bourges.

Under the guidance of this vivacious juvenile—who, not thinking his scholastic costume of blouse, &c., sufficiently *soignée*, comes out attired for the walk, to use the slang of the day, quite "up to date"—we "do" these "lions," of which we shall make casual mention as we go on.

The earlier part of the afternoon having been spent in the commodious apartment—half salon, half chambre à coucher—allotted to us answering sundry letters awaiting our arrival, we stroll through the hilly streets towards the archiepiscopal gardens on the south side of the cathedral, where the tasteful laying-out of the flower-beds—a border of ageratum enclosing a pêle-mêle of geraniums, roses and heliotrope—does not fail to elicit our admiration. Next morning we are up betimes, and after an invigorating plunge in one of the willow-bordered streamlets, followed by a brisk walk, do ample justice to a déjeuner à la fourchette at 8 A.M., and then, armed with note-book and pencil, repair for a long morning's work at St. Etienne. We have, however, some little time to wait ere we can commence operations, as the canons are reciting their morning offices in choir. Their rising altogether as the clock strikes nine is very impressive. In the north aisle two girls with market baskets are eating their premier déjeuner, thus, we suppose, gratifying their organs of admiration and alimentiveness simultaneously. Although the Mass is not sung the officiating canon is served by several red-cassocked and cotta'd boys, who, having been shod with the slippers of silence for the sanctuary, emerge from the sacristy when all is over, very sublunary mortals indeed, in hobnailed boots, making a tremendous clatter, and with no collars or wristbands to speak of. Each kneels for a short space at the choir gate as he passes, and is understood to go through a prayer. Then the Blessed Sacrament is carried down the aisle and out at the south porch, preceded by a boy in cassock and surplice bearing a Gothic candle-illumined lantern on a pole, and very picturesque the little procession looks as it descends one of the narrow streets near the cathedral in the bright sunshine, and halts before the door whence the "sick call" has come.

"Though one of the finest and largest in France, covering 73,170 square feet, the cathedral of Bourges," says Fergusson, "is still one of the shortest, being only 405 feet in extreme length; yet owing to the central aisle being wholly unbroken it appears one of the longest, as it certainly is one of the most majestic of all." After some rather disparaging remarks about the five unequally graduated aisles, the writer continues:—"It is singularly beautiful in its details and happy in its main proportions, for owing to the omission of the transept the length is exquisitely adapted to the other dimensions. Had a transept been added, at least 100 feet of additional length would have been required to restore the harmony, and though externally it would, no doubt, have gained by such an adjunct, this gain would not have been adequate to the additional expense incurred.

BOURGES CATHEDRAL: NAVE LOOKING EAST.

BOURGES CATHEDRAL: SOUTH PORCH.

"The greater part of the western façade of this cathedral is of a later date than the building itself, and is extended beyond the proportions required for effect so as to overpower the rest of the building, so that it is only from the sides or the eastern end that all the beauty of this church can be appreciated."

There are five great western portals at Bourges which, viewed by themselves, are truly noble. The spirit with which the historical sculptures are designed is admirable, and even in the most serious subjects there peeps forth that grotesque slyness which the Mediæval artists knew so well how to render telling in subordination to their grand design. We spent quite an hour in deciphering the wonderful sculptured groups portrayed in these porches. In that of the Expulsion from Paradise, the serpent—or rather dragon—is seen hurrying out before Adam and Eve with a look of most intense disgust; but a little further on in one of the recessed orders is the Deluge, with miserable creatures struggling in the agonies of suffocation, while the serpent peeps round the corner truculently

joyful. It is in the tympana of these five great western portals at Bourges that the chief beauty of their sculpture resides. Here the various groups remind one of a delicate ivory triptych. The varied expression of the countenances, the elevated character of many, the easy flow of the drapery, and the good execution of the whole, bespeak the work of an eminent sculptor, but his name, as well as that of the architect of the cathedral, is unknown. The Last Judgment, in the central portal's tympanum, is fearfully and wonderfully portrayed. Unfortunately only five of the full-length figures lining the sides have as yet been restored. These are on the right of the central door, above which is a large six-light window of early Flamboyant character. And here our praise of the façade of Bourges must cease, an incompleteness in detail and absence of accompaniments from the upper stages precluding it from ranking with those of Amiens, Paris or Rheims.

Of the towers flanking the façade that on the south is First Pointed and does not rise above the apex of the great central gable, with its patriarchal cross, yet it is very beautiful and harmonious in its parts. The northern one is entirely a lofty late Gothic erection (1508-38), and, like the great south-western tower of Rouen, is called "Tour du Beurre," from its having been erected with the money raised from indulgences to eat butter in Lent. It is best viewed from the north-east, on which side of the cathedral the rapid slope of the ground from west to east is most marked. There is likewise a declivity from south to north, so that you enter the building by a porch opposite the archiepiscopal gardens without ascending or descending steps, while on the northern side there is a considerable flight.

The view of the cathedral from the north-east is undoubtedly a noble one. We do not seem to feel the want of transepts, the eye dwelling contentedly on the fine range of clerestory windows and flying buttresses, while the aisles are agreeably broken up by the numerous projecting chapels and the porches. These have for outer doors a couple of beautiful thirteenth-century cusped arches, but the inner doors are Romanesque, and resembling those in the west front of Chartres, a doorway in St. Benigne, at Dijon, and that on the south side of the nave at Le Mans, date from about the middle of the twelfth century, being formed of fragments of sculpture belonging to the former cathedral. "They are remarkable," says the late Mr. G. E. Street, "not only for the really astounding skill of the mechanics who wrought the curious sculptures with which their columns and other members are covered, but for the remarkable fact that, among the branches of foliage, in which the utmost skill of Byzantine artists is rivalled, nude figures and animals are represented with a feeling for nature which is all the more surprising when compared with the stiff and conventional representations of life-sized human figures in the same work."

Entering by the southern of these portals, we are perfectly overwhelmed with the breadth and majesty of this cathedral of Bourges. Its enormously lofty nave (123 feet); its grand unbroken range of columns (huge cylinders, round which several slender ones cluster); its double aisles continued right round the choir in one sweep, the inner one (71 feet high) furnished with its own triforium and clerestory, as at Coutances and Le Mans; the lovely glimpses of stained-glass seen dimly athwart the great thick-clustered columns dividing these two aisles—all this bursts upon us in such a manner that we are quite unable for some time to turn to the actual details of the building. The first feeling of wonder having subsided, one of slight disappointment arises in the mind of the true artist at the somewhat slovenly and coarsely-designed triforium, and the too small clerestory, compared, that is to say, with the great arcades, where, by the way, we miss the grand deep series of mouldings our English arches of the same date have. The triforia consist only of five or more trefoiled and slender-shafted arcades, and in the earlier portion of the church—the choir—the tympana of the arch in which they are pierced is left plain. One cannot help wishing that these triforia had been dispensed with altogether, as at Coutances and Mans, and greater height given to the clerestory windows. In the apse the windows in that stage are of the plate-traceried kind, and composed of two unfoliated lights with a large sexfoiled rose in the head, a type of window of which a singularly felicitous modern example may be seen in the apse of the successful red-brick church of St. Mary the Virgin, Primrose Hill. In the sides of the choir and nave the clerestory windows, still plate-traceried, take a three-light form, increasing in richness, together with the triforium, as they progress westward. There is a noble array of saintly figures in the choir windows of this range; while a simple grisaille, with, however, a subject in the circle, fills those of the nave. It is almost needless to say that this glass, taken into view with that of the inner aisle's clerestory and with that in the encircling chapels, presents a *coup d'œil* of combined solemnity and magnificence surpassed only by Chartres.

(To be continued.)

HOUSE-PLANNING FROM THE ÆSTHETIC POINT OF VIEW.*

(Concluded from last week.)

THE quadrangle system of plan is no doubt one of the best for combining a considerable degree of architectural effect with a certain degree of retirement and domestic feeling. It is not the most effective for an exterior view, as in most cases one only gets the architectural impression of the front; nor is it the most wholesome form of plan in a sanitary sense. The E plan, with or without the centre shank to the E, gets over two of these objections, and, especially with a low screen or colonnade across the fourth side, is highly effective architecturally; but it introduces the new objection for internal convenience, that each end of the returns is a *cul de sac*. Hatfield is a good example, and contains also a fine interior point in the long and wide gallery running from end to end of the principal mass and connecting the two largest rooms, with the added dignity of a colonnaded screen at each end. As a contrast to this grandiose arrangement, it is curious to observe that in one wing the only means of reaching the bedrooms is through the gallery of the chapel, though this may be defended as a pious arrangement to induce the guests to say their prayers before going to bed. Before long, however, the quadrangle plan was destined to give way almost entirely before the favourite scheme of the later Renaissance—that of the centre block and wings—and as a system of house-planning on a great scale, nothing so grandiose has ever been devised. Vanbrugh, though he did not actually invent it, was the great high priest of this movement, the leading motive of which was, instead of hiding the offices away, as Bacon suggests, to make them contribute to the show. If we have to cover so much land with building, the architects seemed to think, let us make the most of it in the architectural result; let our stable wing on the one hand, and our kitchen or laundry wing on the other, serve to extend the effect and act as architectural supports to the central mass. Mr. Blomfield, in his admirable book on the English Renaissance, quotes the words of Reynolds in admiration of this treatment as used by Vanbrugh:—

> To support his principal object he produced his second or third groups or masses; he perfectly understood in his art what is the most difficult in ours, the conduct of the background . . . and no architect took greater care than he did that his work should not appear crude and hard, that is, it should not abruptly start out of the ground without preparation.

In fact, Vanbrugh had a great deal of the feeling of those who have been called sculptor-architects. Observe, in the case of Castle Howard, how the lines of the balustrade fence on each side of the courtyard are, as it were, modelled in and out in breaks and curves, to escape what Reynolds calls the "hardness" of straight lines. This same modelling of wall lines is a point also with Wren, as is shown, inter alia, in the admirably designed plan of the boundary walls between the street and the courtyard of the old Trinity almshouses, which we have lately just managed to save, and of which Mr. Thackeray Turner remarked with truth that those walls alone were enough to indicate the hand of Wren. Vanbrugh's great work is, of course, Blenheim, a plan of the grandest type, with its great terraced and cloistered forecourt 350 feet long by 300 feet wide, and the kitchen and stable courts, each (with their surrounding buildings) about 250 feet by 200 feet, opening from it to right and left. The plan is absolutely axial in both directions, two great longitudinal corridors running in parallel lines from wing to wing. Among other points it may be observed that the use of internal courts to light the corridors, which is sometimes regarded as a very modern expedient, is used here for the principal corridor at all events. The quadrant treatment connecting the wings with the centre is another example of Vanbrugh's modelling. The use of quadrant corridors to connect the house with the separate outbuildings became a constant feature of the later Renaissance plans; in this case it is not a corridor, but a portion of the main building

* A paper by Mr. H. H. Statham, read at the last meeting of the Architectural Association.

treated in this shape; it looks very fine in effect, but there is always this objection, that it involves the existence of odd-shaped triangular rooms in its rear. In this case these irregular spaces are utilised as dressing-rooms in connection with rectangular bedrooms. It is one defect in the plan that the extreme right wing is one great gallery (180 feet long), and the corresponding left wing is divided up into rooms, though the exterior architectural treatment is identical in both cases. The great gallery should certainly have been a special feature; that is one of the pitfalls of absolute symmetry. Vanbrugh has been laughed at, too, for having made the chapel and the kitchen balance in the angles of the outlying blocks, but this is not so illogical as it is said to be. Man was philosophically regarded in those days as a being composed of two elements, body and soul, neither of which could in this world exist apart from the other. The needs of the soul were provided for in the chapel on one side, and those of the body in the kitchen on the other side; both were equally necessary to a complete mundane existence, and Vanbrugh treated them accordingly, with architectural correctness.* The principal defect of Blenheim in an architectural sense is the want of a grand staircase appropriate to the general grandeur of the plan. The main staircases in two side halls on each side of the great hall are convenient enough, but these halls are only 11 feet wide, leaving only about 5 feet for the width of each flight; a miserable proportion for so great a house. At Castle Howard the staircases are planned in just the same way and of the same size. The staircase, alone in these plans, seems to be treated in a purely utilitarian manner; regarded as a means of ascent only. The architectural glory of a great staircase does not seem to have dawned on the mind of Vanbrugh.

We may compare with Blenheim the magnificent plan of Charleval given by Du Cerceau, which, with its series of colonnaded courts, the great one in the centre and smaller ones on each side, the great square central block flanked by gardens and the surrounding canals, is really sublime, and seems more like a castle in the air or a château on paper than a design seriously intended for execution. Across the canal at the back is a great formal garden as large as the whole of the rest of the plan. Turning to the less magnificent but most interesting and varied English Renaissance plans collected in the "Vitruvius Britannicus," we find all kinds of variations played on the idea of outstanding wings connected with the centre by colonnaded quadrants. At Roehampton House, by Archer, the quadrants are convex, and it will be noticed that the front walls of the forecourt show that same kind of modelling in curves which seems to come naturally from Wren's pupil. In the plan of Eaton Hall the general square lines of Seaton Delaval predominate, the stables and other offices flanking the courtyard without even being masked by arcades; but the great semicircular sweep of the wall of the outer court is fine. At Beaconsfield (Millner), where the concave quadrant is again employed, the stable openings are round on the outer side, not towards the courtyard. In that remarkably stately modern plan, Mentmore, we see how in like manner the kitchen wing fronts away from the house, and the back walls of kitchen and conservatory blocks, facing each other at each side of the forecourt, are made use of as decorative screens with niches for sculpture, so that they form part of the architectural pomp of the entrance. The quadrant connection at Beaconsfield is badly managed, as it does not butt against the house block, but returns on itself, leaving an open end. At Hopeton House, Scotland (Sir William Bruce—"justly esteemed the best architect of his time in that kingdom"), the convex quadrant is again employed, this time better managed in its connections; the staircase occupies a fine position in an octagon hall in the centre of the house. At Lowther House, Westmorland (no architect's name) we have an entirely original arrangement, the advanced wings ending each in an elliptical hall (the chapel on one side, the library on the other), the forecourt slightly raised and protected by a balustrade, and reached by a semicircular range of steps projecting outward at a 40-feet radius; the whole embraced, as it were, by a range of arcaded cloisters on each flank, projecting beyond the forecourt. Braman Hall, one of Colin Campbell's own designs, shows a square block with two small wings connected on each side to the house by a lofty colonnade of three bays, with very bold effect; here, as at Blenheim, the outer blocks are the chapel and kitchen, treated identically. Castle Ashby, a courtyard plan by Inigo Jones, takes us back a generation and illustrates one point in Bacon's plan, the staircases being placed in projecting turrets at the re-entering angles of the courtyard. Eastbury, by Vanbrugh, is very much on the same lines as Seaton Delaval, with the square forecourt with arcades down each side to mask the stable and kitchen wings, and the same vast rusticated order to the house. Here Vanbrugh again uses his favourite arrangement of the two staircases one on each side of the central hall, but in this case he is more liberal to the stairs; the central hall or vestibule, about 12 feet wide, is here only a connection between the great hall in front and the "salon" at the back, while the stairs have an ample space 20 feet wide on each side, but shut off from the vestibule. At Seaton Delaval the stairs are provided in a projecting tower at each end of the main longitudinal corridor (which crosses the end of the great hall), the towers being square externally but the stairs elliptical on plan. At Grimsthorpe Vanbrugh goes back to the quadrangle plan, and for once aims at a fine effect with his staircases, which are 8 feet 6 inches wide in the lower flights and 7 feet in the upper, and placed within a double screen of columns at each end of a hall 125 feet long, the staircases visible through the columns and not shut away out of sight. At Burlington House the stable and kitchen wings occupied the middle portion of each flank of the courtyard, where the buildings of the learned societies now are, and the court was closed by the two quadrant colonnades at the end opposite the house—that colonnade which was so stupidly removed and allowed to go to pieces. At Houghton (Colin Campbell) the kitchen and laundry wings, connected by the habitual quadrant, are set back into the rear instead of being brought to the front, and the same is the case with the stable and offices wings at Duncombe Park (W. Wakefield), in which the quadrant is dispensed with, and the outlying blocks more conveniently connected with the house than usual. In Mereworth, Campbell contrives a square house with a portico on each face and a central domed hall, which might be capable of charming treatment; unfortunately he has found nothing better to do with his staircases than to make them corkscrews in the piers of the dome, a very mean treatment for a house of this class.

The plan of Kedlestone with its outlying pavilions connected by quadrants is well known, it has been in so many books; it is a kind of plan which looks more effective on paper than it ever can look in reality, as you can never see it all at once; moreover, the quadrants are badly managed; instead of butting into the wings they terminate in a blank end and you have to make a right-angled turn to get any further. The treatment of the centre block of the house, with its great columned hall leading into the square salon and thence to the garden steps, is really fine; on the other hand, the staircase is ignominiously packed out of sight in a side recess. The quadrants at Kedlestone, it may be observed, are closed and with windows, not colonnaded. At Nostel (Paine) the same idea is better carried out, though the interior plan of the house is very commonplace compared with Kedlestone. At Nostel we find a recognition of one of the drawbacks to the use of the colonnaded quadrant; the colonnade looked very pretty in itself, but the servants passed visibly to and fro along it, which must have looked out of place sometimes. So at Nostel the quadrant consists of a walled passage for the traffic, with the colonnade in front and concentric with it for effect, thus making the best of both worlds. The same contrivance was carried out at Fonthill and in some others of the houses of this type. At Holkham Hall (by Kent) the pavilions at the angles are rectangular and more closely connected with the house, but the main idea is the same as at Kedlestone. The treatment of the staircase at the end of the hall, with its wide lower flight of steps, is more dignified and stately than in most of these examples. A remarkable plan, standing quite alone in character, is that of Buckland, by Wood, of Bath. It has, indeed, more of the character of a kind of State villa than a mansion, but it is a very fine plan for internal effect. In this case the two end octagons are the chapel and the library, representing architecturally, shall we say, the soul and the intellect; the body is cared for in the basements under them, which are respectively wine and beer cellars, like Mr. Sherrick's vaults under Lady Whittlesea's chapel in "The Newcomes." Stanlinch, which is also by Wood, shows somewhat the same general idea, but the arrangement of the doors in the central portion of the house is such as lose the vista from end to end; this was probably intentional, as the right-hand wing is a very spaciously planned State bedroom suite, and privacy of approach to it would probably be consulted. In the left-hand wing is the principal room—the dining-room; in this less religious plan the chapel is wanting. The staircase, unfortunately, is very poorly treated. Lastly, Moor Park (Thornhill) is a remarkable example of a stately approach, in which the quadrant colonnades instead of being merely connections with the wings, are extended so as to form a mask to them entirely, leaving the planning behind them rather inconvenient, but the fine effect in front may be said to atone for this. The idea was probably suggested by Bernini's colonnades at St. Peter's.

There are few things to my mind more fascinating than the study of this collection of plans, so full of fine suggestions of effect, so uniformly stately and dignified in their variety; one cannot help thinking again and again what one could do with them in actual architectural treatment. It is true that our enthusiasm in a sense is damped on turning to the elevations, except those of Vanbrugh and one or two others. The

* The symmetrical treatment of chapel and kitchen occurs in other plans in the "Vitruvius Britannicus"; it is not confined to Vanbrugh.

mechanical manner of the engraving and shading does not assist them; but apart from that one cannot help wondering that men who had such fine ideas of the basis of architectural design in plan should have had such lame and formal ideas of their decorative treatment. But what of that? That only shows that there is something left for us to do. Now that we have shaken off the deadening influence of architectural scholasticism and red tape, what splendid things we could do (couldn't we?) if we could only get the chance of treating some such mansion plans as these with the freedom and the richness of detail which we could impart to their treatment in the present. Surely we could make something finer of this type of plan than of the irregular and so-called "picturesque" plan.

But then there is the question of convenience—a question which will not be shirked. Mr. Blomfield remarks on this head:—

> It is, of course, necessary to isolate the kitchen and servants' quarters from the big rooms of a house, but such a total disregard of convenience and economy as is shown in these eighteenth-century plans would not be tolerated for an instant in modern house-planning. The point of view has shifted.

True enough, but has it not shifted a little too far? Let us continue Mr. Blomfield's sentence:—

> Vanbrugh and his successors were permitted to subordinate the comfort of the house to its external architecture. They began from without and worked inwards; the entire design was handled with a view to the realisation of a certain composition, without regard to convenience of arrangement, and the consequence is that there is always a distinct architectonic conception running through the whole of any one of their designs, which is necessarily absent in the heterogeneous assemblage of buildings which compose most modern country houses.

I think the latter half of Mr. Blomfield's paragraph rather gives away the first half. "A distinct architectonic conception." Is not that worth sacrificing something for, unless we are to return to the "two sticks and a mat," in principle at all events? Let us consider that for a moment. What does the inconvenience really amount to? It lies mainly in one point—the position of the kitchen. That is what you will find again and again in architectural books—the kitchen was 100 feet, 150 feet, 200 feet, from the dining-room, &c. Even in the modern example, Mentmore, before referred to, the distance from the kitchen door to the dining-room door, taking the line along the passages, is 147 feet (I measured it on the plan). One could hardly in such case say with Milton (referring to the meal in Paradise), "no fear lest dinner cool." That is a real inconvenience, but there is no occasion to revive that. In these days of lifts the kitchen might be in the basement or it may even be in the attic—perhaps with greater advantage to the avoidance of possible smells. All the provisions can soar up there in the lift with the greatest ease, and when prepared, by the same means descend to the serving-room. Apart from that kitchen question, the wing system of plan may retain all its architectural attractions, not only without any sacrifice of convenience, but even a certain convenience and suitability. In most houses of the largest class there is now a bachelors' stair and a bachelors' suite of rooms for visitors who are of that persuasion. Why not a bachelors' wing as a separate block, with a smoking-room on the ground floor and bedrooms above? And then, if one were to match that at the opposite angle by a young ladies' wing, with a charming drawing-room or boudoir on the ground floor. Then what opportunities for a delicate and appropriate contrast in the design of detail and ornament in the two wings, suggesting their opposite characters—sturdy strength symbolised in the one, beauty and grace in the other, at the same time keeping the general mass and outline of both sufficiently alike for architectural symmetry; a kind of symmetry far more interesting and eloquent than that frigid mechanical symmetry of the Renaissance, each pilaster and each urn on one side answering to a precisely similar one on the other side. I declare one's imagination is quite stimulated by the thought of the artistic opportunities that such an arrangement would afford. Nor is there any inconvenience in the arrangement of a laundry wing, and some other offices perhaps, connected with the main house by corridors, and yet separate, and turning their backs on it, the back walls being treated, as at Mentmore, in a decorative manner. The stable wing, it is to be feared, will hardly be accepted, unless where, as at Blenheim, the scale is so great that it is really a long way from the house.

There is no occasion, however, that we should imitate the favourite form of plan of the Renaissance architects. I would only urge that it is not necessarily inconvenient, and that its architectural capabilities have not been exhausted. But let us summarise the problem from the present point of view. In a mansion of the largest class we have to provide for two distinct departments, very different in their architectural requirements, and yet which must be in tolerably close relation with each other. We have the owners and their family and visitors on the one hand, with the rooms in which their life is to be lived, and on the other hand the servants and the rooms in which the work and supply of the house have to be carried on. Granting the principle that the mansion should be treated architecturally in a symmetrical manner (because no other treatment is so dignified), how are we to treat these two departments? The Georgian system was to have one great parallelogram of building and divide it up as convenient without any reference to the exterior design, which can hardly be called an architectural method. But if you wish for one great block it is possible to divide the two departments vertically and not horizontally, to have a lofty two-storeyed basement, with a very wide sunken area for the lower windows, and place the State rooms and living rooms on the first floor, with a great staircase up to their level. That is the old system of the Italian Renaissance palaces; it has been little if at all tried in England, but it naturally suggests an architectural treatment which would be very fine and effective indeed, and is worth thinking of. On the same principle of vertical division the servants' bedrooms could all be collected in the highest storey, occupying what in a Classical building would be called the attic; and, as before observed, in these days of lifts there is no difficulty in such vertical division. Another method is the favourite one of the Renaissance architects, of the wings connected to the house by corridor buildings, which has the merit of making the subsidiary departments subserve the general architectural effect, and the inconvenience of which, as I have ventured to suggest, is, if it is properly managed, more imaginary than real. Then we may have what is the more favourite scheme now, the servants' quarters and offices rather more closely attached to one angle of the main building, forming a second parallelogram placed *en échelon*, or a long wing stretching away to the rear. But in this case it is difficult to make it in any way part of the main architectural design; it must be retired and planted off out of sight. A central connection of the offices with the back of the main building may sometimes be possible—it depends on the plan of the house and the direction in which the garden is laid out; but in the most stately type of house, as a general rule, it is desirable to have the garden entrance on the central axis line and opposite to the main entrance, as it it is in nearly all the great Renaissance plans.

In regard to the house itself, there are three main points to consider, the approach and entrance, the hall and staircase, and the entertaining rooms. A forecourt of some kind, if possible flanked by something in the way of a colonnade or cloister on each side, always adds to the dignity of the house, more than the conventional sweep drive up to the door or a wretched landscape-gardener's substitute. And for the access to the house there is nothing so fine as a flight of steps—still more a double flight, in two curves, provided the basement is high enough to afford opportunity for it. We have had no greater loss than that of these beautiful flights of steps up to the doors of the old mansions, for which, in our modern anxiety for comfort, we have substituted that odious excrescence called the porte-cochère. Certainly, were I a millionaire and could build a mansion to suit my own tastes, I would revive the flight of steps; but people coddle themselves so now that they are quite afraid of walking up an outdoor flight of steps; they must forsooth be set down under cover, and for the sake of their vile bodies they sacrifice architectural dignity. If you must have a porte-cochère, better to have a central projecting tower or pavilion and make the ground storey an open arcade or colonnade; then you may have a fine effect, then it appears as part of the architectural design, while the mere porte-cochère never looks like anything but an excrescence. Inside the house, you must have a large central hall, lighted from above, unless it goes right through the house with a great window at each end; and you must have above all things a spacious and noble staircase, not hidden away out of sight. A flight of stairs well designed is one of the finest objects in architecture, and on a reception night with a crowd of guests it is a fine part of the show; like Jacob's ladder, angels ascend and descend upon it. Where there is a very large hall, the stateliest staircase will probably be one which is in the hall and forms as it were part of it; one may even commence it with a flight of half a dozen steps extending right across the hall. The difficulty in such a case is to plan it so that it will not interfere above with the integrity of the gallery or loggia which you will certainly have round the hall on the upper level. In the case of Bridgewater House, Barry, as Professor Kerr mentions in his book, intended at first to have the stair in the midst of the cortile, where the dotted lines are shown; on second thoughts he took it out of the cortile and made it a separate staircase at the end; the cortile may have gained, but the stair lost in dignity. Delicately modelled curves of the edges of the steps, in the wide lower flights especially, add much to the beauty of a staircase; on a small scale this is very well done in the charming staircase designed by the late Mr. Cockerell for the Society of Water-Colours' rooms, which I recommend students to look at. The weak point in a staircase to my mind is the raking soffit, and it is well where it can be designed so that this is hidden and only the steps them-

selves visible. This is very well done in the grand staircase of the Paris Hôtel de Ville, where two broad flights between marble-lined retaining walls start right and left from the lower hall, and this kind of staircase may be also applicable to a private mansion on a large scale, where the upper plan was such as to admit of landing the staircases at two widely removed points. At the same time it may be said that the double staircase has more affinity with the idea of a public hall than of a private house. Where the general plan allows of it a flight of stairs on a long curve is nearly always fine, not a circular stair—that looks too utilitarian as if it were done to save space—and the curve is too quick; but an elliptical hall, for instance, with a stair following its curves up on each side, is a noble scheme. But there is no end to the beautiful things that may be done with stairs where there is space enough; they are the poetry of internal architecture.

As for the entertaining rooms, the great desideratum for them is that which applies also to the whole ground-plan of the house, viz. that they should represent an architectonic conception in the configuration of each room and in their relation to each other. Systems or ideas in planning are endless; the great thing is that there should be an idea, and not merely a space divided into rooms by walls. Another point that will almost always be right (though there may be exceptions in special cases) is that the principal dining-room should be on the opposite side of the hall from the drawing-rooms. Another is that the principal rooms should be planned on an axis, and should be capable when desired of opening out a vista through the greatest length of this portion of the house; remembering, as before suggested, that mystery is not the attribute of a great house so much as grandeur. Then as to the question of intercommunication, a corridor, of the ordinary proportion of width, is not the best suited to such a house; it is a feature more characteristic of a public building; if there is a long apartment of communication, it should be rather of such proportionate width as may remove it from the category of corridors to what is more properly called a "gallery"; not a mere passage, but a long room which is also a passage. And in a State suite of rooms it is a question whether some of the rooms of ordinary proportions may not quite fitly be planned to open one out of another, and one be used as the passage to another. Upstairs, of course, we must have corridors—we cannot in the present day walk through each other's bedrooms in the nonchalant manner in which the inhabitants of many Elizabethan and Stuart mansions must have done; but in a suite of entertaining rooms on a great scale there is no objection to walking out of one into another, and there is even a certain added dignity in the arrangement, as if the house were on too grand a scheme to stoop to the mere utilitarianism of corridors.

In conclusion, I would encourage those who have the chance of building large houses to endeavour to revive in them some of the old stately character which, as it seems to me, has been sadly lost during the present century, through a mistaken craving after what is called the picturesque, and not to be afraid of trying new and original dispositions of plan merely because they are new and original. Why is a form of plan which promises a fine effect to be shirked merely because it is unlike what people are used to? You would perhaps say, or your clients would say, that this plan of Du Cerceau's (one of his numerous suggestions) was a very outré idea for a house; and it must be admitted that as it is shown by Du Cerceau it is a very bald suggestion—merely a kind of skeleton plan; but what a beautiful thing, both internally and externally, might be made out of that idea if it were worked out in a more complete and architectural manner. As an example of a modern plan of great originality and beauty we may take that of "Chesters," by Mr. Norman Shaw; also a plan, as you see, with an idea, and which is a fine example of the novelty and effectiveness in house-planning which is within our reach if we will give our minds to it. There is far more to be done in the way of invention and fine effect in the planning of the higher class of mansions than has yet been done; while we can emulate, in new forms, the stateliness combined with variety of the Renaissance plans, we can clothe them with detail much more free and expressive than the dead scholasticism of the Orders with which our able Renaissance predecessors were fettered. But we must begin with the plan.

The Chairman said they felt the value of Mr. Statham's coming amongst them, and it was because of his knowledge that the committee had thought proper to leave the subject to be treated to his own suggestion. From what the members had heard that night, the committee could not regret that they had left the title of the paper to Mr. Statham himself.

Professor Aitchison, R.A., who proposed a vote of thanks to the author of the paper, said he was not there to teach but to learn. He could only re-echo the author's remarks. Regarding the importance of a good staircase, he (the speaker) found that in the larger mansions the reception-rooms and principal galleries were on the first floor. The approach to them should suggest therefore some of their magnificence, as well as being a feature of the hall. Although unacquainted with many of the large London houses, he believed some had grand staircases. Ashburnham House had a staircase after the designs of Inigo Jones. Although Mr. Statham did not approve of circular staircases, he could not agree with such views. Circular staircases could easily be made beautiful, although their treatment was more difficult. Like many features in architecture, it required special study to excel in the design of staircases. Perhaps the Italian palaces offered the best examples in this work.

Mr. Halsey Ricardo, who seconded the vote, said the paper showed an enthusiasm for the plans of the old buildings, and seemed to suggest that they were good material for the present day. These buildings were interesting and pathetic as things of the past, but their spirit belonged to a different age than ours, and it would be making false the spirit of the age if introduced into modern work. Many of these old buildings were ingenious and perhaps interesting to the student because of the difficulties that had been overcome, but that was all. If they were to build for posterity their work must be more in accord with the general feeling—a more humane feeling than was to be found in the people of the past.

Mr. Beresford Pite thought it was very difficult to find the real spirit of the age in which they lived. If a man could ever do so, his success was assured. The art of planning depended much on the ability of the architect to be interesting. They could not forget that Mr. Norman Shaw had fascinated the whole world with his Gothic planning and the hundred and one things which he imported into a modern building. There was an art and a charm in his rambling planning as well as in his methodical. The real art of architecture was the investing with beauty of the ordinary arrangements of everyday life. Every arrangement of planning was interesting, and when they came to artistic planning they would find that the modern ideas of comfort would settle the plan.

Mr. Francis Hooper also joined in the discussion.

Mr. Statham briefly returned thanks.

THE WADDESDON BEQUEST.

ON Saturday the Trustees of the British Museum resolved to accept the bequest of the late Baron Ferdinand Rothschild on the condition stipulated, that the collection should be kept by itself in a room to be designated "Waddesdon Bequest Room." According to the *Times* the number of objects comprised in the bequest is not very great—about 260, exclusive of the illuminated manuscripts—and of these only a limited number are of any size. The whole collection was contained in the smoking-room at Waddesdon—a room of no great dimensions—and it is well to say at once that it is essentially a "cabinet" collection, where almost every piece will require minute examination before its beauty and interest can be fully appreciated. There are no suits of armour, no large pieces of Renaissance furniture, no sculpture, except on a Lilliputian scale. Waddesdon contains endless treasures in the way of furniture and pictures, but with these we have at present no concern.

The collection comprised in the bequest comprises plate, jewellery, enamels, carvings in boxwood and hone stone, Italian majolica and glass, a few important pieces of arms and armour, and bronzes. A great proportion of the specimens are such as only the very few can afford to possess, and among these few the competition is so keen that the sums paid for the objects reach remarkable proportions. Some of the more important pieces in Baron Ferdinand's collection are from well-known sales—the Fountaine, Hamilton Palace, Londesborough, Magniac, Spitzer and others—and these, of course, are more or less known to the interested public, who have had an opportunity of seeing them in the sale rooms. But a great number have passed quietly and directly from the possession of their former owners into that of Baron Ferdinand, and these will have for connoisseurs the added interest of novelty.

The word plate scarcely conveys to the ear the impression made by seeing the fine array of richly chased cups, tazzas, spoons and other objects which the princes and wealthy merchants of the sixteenth century used to garnish their tables, and of which there is here a goodly number. Nor are the precious metals alone brought into play; ostrich eggs, the "griffin's eggs" of Mediæval times, the iridescent shell of the nautilus, rare and curious stones from the East are all found, enriched with gold or silver mountings on which the graceful fancy of the French or Italian goldsmiths of the Renaissance has been allowed full play. A favourite device was to make the whole cup in the form of a bird or animal, perhaps the armorial bearing of the owner, and the collection contains a number of figures of unicorns, boars, stags and bears, as well as occasional figures of the huntsman. An odd fancy of the time was to make two cups so fit together at their rims that one formed the cover of the other, and of these there are two good examples in Baron Ferdinand's collection.

The section of jewellery and jewelled objects contains, how-

ever, some of the truly priceless objects; it may safely be said that some few of them are not surpassed by any cabinet in Europe. Those who had the opportunity of visiting the fine exhibition of European enamels at the Burlington Fine Arts Club eighteen months ago will not fail to have noticed a series of five small vases of Oriental onyx, chalcedony and lapis lazuli, interesting enough in themselves, but rendered of immensely greater importance and value by their gold mountings, enriched with delicate translucent and other enamels in the most perfect style of the ripest Italian art. The principal piece of these is an oviform vase of chalcedony, about 9 inches in height, carved in cameo with vine branches and grapes, with two projecting handles cut from the solid stone. Thus far it is of good Classical work, and the cunning craftsman of Imperial Rome who fashioned it would most surely appreciate the refined skill with which another artist of his native Italy has enriched it 1,500 years later. The mounting is throughout of solid gold, partly covered with delicate enamelling in brilliant colours, every detail of which is perfect of its kind and carried out in the fullest harmony with the design of the vase itself. The second is of somewhat smaller size, but scarcely, if at all, of inferior importance. It is in the form of a ewer, the body being of bloodstone, slightly carved, but of singularly graceful outline; the gold mountings are of the same richly-jewelled style as those of its companion, and are perhaps the work of the same skilful hand. The handle, which is in the form of a snakelike animal, is thickly set with emeralds and rubies, and upon the upper curve is perched a dainty figure of Cupid, of gold enamelled white, with his arrow raised in his hand ready to strike. The spout is modelled in the same style to represent a dragon, and equally studded with jewels. The other pieces of this fine set are of the same brilliant decorative character, and if separated from the two vases just described would easily take a first place in any collection. One of them is carved from a single block of lapis lazuli, and, like the first, is of antique Roman work, mounted in gold by an Italian artist of the sixteenth century, who has placed on the cover a delicate little group of Venus and Cupid; the other two are of jasper, a tazza and a covered vase, the latter surmounted by a large uncut crystal of ruby.

It is not an easy task to give an idea of the variety to be found among the articles for personal adornment without adopting the style of a descriptive catalogue. Some of the finer pieces were shown at the Jewellery Exhibition at South Kensington in 1872 by their then owner, and are in the catalogue under Nos. 206, 207, 211 and 212. One of them is a singularly charming pendent jewel, with figures of Venus and Cupid in enamel in the centre; it may very probably be by the same hand as another, similar in general design, but with the subject of the rebuke of St. Thomas, now in the collection of Sir Richard Wallace. These and a large proportion of the others in Baron Ferdinand's collection are executed in the style that is usually attributed to Cellini, and are, at any rate, almost uniformly classed as Italian work. Baron Ferdinand himself took this view, and was strongly of opinion that this particular class of work was all of Italian origin. There is, however, good ground for thinking that a number of these richly-jewelled pendants with graceful figures in enamel are rather German than Italian. The intimate trade relations between the principal cities of Southern Germany and Italy had a marked effect on the art products of the former, and in many directions this is readily admitted. An examination of the work of the Bavarian goldsmith, Hans Mielich, in the Reiche Kapelle in Munich and in the Bavarian National Museum, would show that this Italian influence was fully as strong in the direction of enamelled jewellery as in silversmiths' work. The Limoges enamels include some brilliant pieces, and, with one exception, they belong to the painted enamels of the sixteenth century. The exception is an important chasse or reliquary of champlevé enamel, dating from the thirteenth century. The subjects are from the lives of St. Martial and St. Valerie, the former of whom was the patron saint of Limoges, the city where it was made. This is an unusual specimen both in size and execution, and the peculiar style of which it is a good example is not well represented in the Museum. The later enamels include three caskets, all of fine quality. One is from the Bernal collection (lot 1,565), ornamented with figures of the Sybils painted in grisaille and mounted in silver-gilt. The enamels have the well-known signature J.P., which are usually attributed to Jean Penicaud, but in this instance it has been thought possible that they may represent Jean Poillevé, enameller and goldsmith. The second casket is also painted in grisaille, with Biblical scenes in small panels, and is believed to be from the hand of Pierre Reymond, while the third is a characteristic example of Susanne Court. By Pierre Reymond there are also a plaque with the Judgment of Paris in colours on a blue ground, and a second with a pleasure party in a boat—both good examples of his coloured work. The collection includes three fine portraits; one from the Spitzer collection represents Catherine of Lorraine, Duchesse de Montpensier, and is a splendid specimen of the Limoges style of portraiture, important both from its size and from the historical interest of the portrait. The second is a small circular medallion with a half length of the short-lived Charles IX. of France. Both of these are painted by Leonard Limousin, while the third, a fanciful representation of Diane de Poitiers, bears the F.L. of François Limousin. An important piece in the pictorial style is a framed series of fifteen panels painted with subjects after Raphael; the central plaque, representing Neptune stilling the winds, is an unusually fine example of Leonard Limousin. This also is from the Spitzer collection. Of the large dishes which form such splendid decorative objects the collection contains three, and a fourth has a ewer belonging to it. All are of that brilliant school of colouring where a backing of foil was used to enhance the transparent tints, of which Martial Courtois is one of the best exponents. From his hand is a large circular dish decorated impartially with Biblical and mythological subjects, and an unusually fine oval salver bearing the subject of the Scarlet Woman of the Apocalypse, in which the artist has done his best to reproduce in colour the glowing imagery of Revelation; a third is by Jean Courtois, and represents the Destruction of Pharaoh's host.

A few special objects must be mentioned in the remaining sections. The carvings in boxwood and hone stone are of the highest quality, but some of the former are so minute in their execution that even when held in the hand a magnifying-glass is necessary to show the inconceivably intricate detail of the carving. The principal objects of this class are the beautiful busts of Charles the Bold and his wife Margaret of York, examples of the highest style of sculpture "in little" of the time. Their story is curious; they are said to have formed part of the collection of Rudolph II. at Prague, and there, in a fortunate moment, they were bought by the father of the late Sir Edgar Boehm for the sum of 4*s*. Such chances rarely occur more than once in a lifetime. Another interesting relic of even earlier times is an oval glass cup of the same style and work of the well-known luck of Eden Hall. This curious vessel, which is an attractive thing in itself, has been mounted in silver-gilt and embossed with fleur-de-lis, and the family story accounts for the cup and its mounting by recording that it was won by an ancestor at the Crusades in a game of cards with the King of France.

Such is the general character of the bequest, and enough has been said to show that the nation has reason to be grateful, though there are many pieces of great interest that have not even been mentioned.

GENERAL.

Mr. George Simonds will deliver lectures on sculpture to the members of the Royal Dublin Society on the 24th, 25th and 26th inst. The subjects will be "Modelled Work," "Carved Work" and "Cast Work."

M. Carl Jacobsen, who has enriched Copenhagen with several examples of modern sculpture, has offered to present his collection of works of art to the city, which is worth a quarter of a million sterling, on condition that a special building will be erected to contain it.

An Exhibition of the works of the late C. N. Kennedy is being organised at the Carlton Gallery. The Manchester Coporation have lent his *Fair-haired Slave* for the purpose.

The Council of the Royal Society of Painter-Etchers and Engravers have elected the following gentlemen as members of the Society:—Messrs. Meyer, Milner, Newbolt, Tomkins and Wright.

Mr. John Tweed, whose studio in Chelsea Mr. Rhodes has promised to visit, was the sculptor of the colossal statue of Van Riebeck, the first Dutch Governor of the Cape, which Mr. Rhodes has had erected in Cape Town. The statue is designed from portraits at The Hague.

Herr Rudolf Kempf, the director of the local technical school for building construction, has brought out a folio work on the architecture of Augsburg with the title "Alt-Augsburg." It contains 100 plates.

Mr. Frank Baker, C.E., F.G.S., borough engineer of Middlesbrough, member of the Oxford University Brass Rubbing Society, and member of the Monumental Brass Society, will read a paper on "Monumental Brasses" on Wednesday next before the Northern Architectural Association.

The Vacant burgh surveyorship of Ayr has been sought by eighty-six competitors. Out of that number twelve applications are under consideration.

The Rose Window in the north transept of Chartres Cathedral has suffered during the recent storms.

The First Sitting of the Prussian Diet in the new building was a failure, as the speeches were inaudible. Some temporary remedy is to be provided before the next sitting on to-morrow.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

YORK.—Feb. 2.—For erection of fire-escape staircases and other works in connection therewith at the workhouse. Messrs. Penty & Penty, architects, Lendal Chambers, York.

AT a meeting of the Kirkintilloch School Board Mr. John Cameron, the chairman, moved that plans for an extension of Townhead School be submitted for the Department's approval and estimates got from contractors. The overcrowded state of the school was complained of by H.M. inspector. The motion was carried by a majority of one. The plans as already prepared for the Board provide for a storey being added to the back of the school at an estimated expenditure of 1,500*l.*, giving accommodation for about 300 extra scholars.

A SERIOUS scaffold accident occurred on Monday at West Norwood, at the building works of Messrs. Perrins, situated in Durban Road, Auckland Hill, where a number of villas are being erected, and resulted in four men being severely injured. Just after the dinner hour several labourers were at work on the scaffolding some 25 feet from the ground, when, without the least warning, the poles gave way and the men were thrown to the ground. Four of them—D. Vallas, J. Smith, John Spooner and G. Sullivan—were injured, and Dr. Sharman, a local practitioner, who happened to be near at hand, ordered their immediate removal to the Cottage Hospital at Upper Norwood.

THE CHEAPEST SUBSTANTIAL RELIEF DECORATION.

LONDON WAREHOUSE 92 & 93 GREAT RUSSELL ST. W.C.

Soho Cowl & Ventilator

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."
"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."
"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once.

THE "CITY DIARY."

THE "City Diary," published by Messrs. W. H. & L. Collingridge, at the *City Press* Offices, has now reached its thirty-sixth year of publication, and is replete with information of a nature invaluable to the City man. Among the items may be mentioned a complete list of members of the Corporation, a list of the Livery companies, with the names of their clerks and the location of their halls or offices, the addresses of Corporators, a list of City officers, another of City schools, together with pars relating to the Freedom of the City, City loans, banking information, a list of clubs, institutions, associations, &c. All this in addition to a diary interleaved with blotting-paper and contained in a substantial cover, for the small price of one shilling.

BUILDING TRADES EXHIBITION, 1899.

THE Building Trades Exhibition of 1899 bids fair to rival in importance any of its predecessors. Already the whole of the spacious ground floor and one-half of the galleries have been let, although the exhibition does not open until April 26.

Many of the leading firms in the building trades will be represented, and among others we may mention such names as Doulton & Co., Limited, London; the Farnley Iron Co., Leeds; Gibbs & Canning, Tamworth; Jos. Wedgwood & Sons, Limited, Staffs; Jos. Sankey & Sons, Bilston; Oates & Green, Limited, Halifax; Yates, Haywood & Co., London; J. P. White, Bedford; Stiff & Sons, London; Moorwood & Sons, Sheffield; Jos. Cliff & Sons, London; J. Woodward & Co., Swadlincote; Hall & Boardman, Swadlincote; Ames & Crosta, Nottingham.

Owing to overtures made by several architects, the management has decided to devote the minor hall to a special exhibition of electrical appliances connected with the building trades, while one-half of the galleries will be set apart for an exhibition appertaining to municipal engineering.

The management, as before, is in the hands of Mr. H. Greville Montgomery, and the offices are at 43 Essex Street, Strand, W.C.

DURING the storm which visited Reading on the 12th inst., the spire of the ancient church of St. Lawrence was blown on to the roof of the church, causing considerable damage, and falling thence into the street.

BUILDING AND BUILDERS.

THE prospectus for a new theatre for Perth has just been issued. The share capital is 5,000*l.* in 5,000 ordinary shares of 1*l.* each. The theatre is intended to seat about 950, and when crowded will hold about 1,300. It is estimated to cost 4,500*l.*

IT is proposed to build at Smethwick a mission church in the modern style at a cost of 4,000*l.*, and to seat 500 persons.

THE Wesleyan Methodists have decided to build a church at Fairhaven, a new district between St. Anne's and Lytham, Major Hincksman having promised to erect the church if the Wesleyan trustees would do the furnishing.

MUCH sympathy is felt in the building trade in York for Mr. John Plows, master mason and builder, whose wife died on the 9th at her residence, 18 Victoria Terrace, York. The deceased was sister to Mr. Thomas Prince, builder and contractor, Horbury and Wakefield.

THE health committee of the Southport Corporation have resolved to recommend the Council to add a new wing to the Corporation Hospital for Infectious Diseases in Moss Lane, at a cost of about 800*l.* The alteration would greatly increase the accommodation for the medical and nursing staff, an improvement which has for a considerable time been needed.

THE building regulations committee of the Glasgow Corporation had before them on the 13th inst. the question brought up at the last Council meeting by Councillor D. M. Stevenson with reference to unsightly gables. The committee found that they had no power to deal with the matter. It was agreed to ask the Town Council to remit to them with powers to prepare for submission to Parliament next session a Bill on the lines of that which was dropped last session, embracing a revisal of the whole of the buildings regulations, and such alterations as recent experience has shown to be desirable.

THE City lands' committee of the Corporation are making arrangements for the rebuilding of the Sessions House in the Old Bailey. They have consulted Professor Aitchison, R.A., the president of the Royal Institute of British Architects, who has suggested a competition among a limited number of architects to be nominated by the Council of the Institute. The committee, adopting this suggestion, have approved of six architects being nominated by the Council on the understanding that the acceptance of any of the designs submitted should not be binding upon the Corporation. In the preparation of the necessary conditions of the competition and the ultimate selection of a design, they have appointed Professor Aitchison as assessor, with the co-adjutorship of the City surveyor (Mr. Andrew Murray). Each unsuccessful candidate submitting a complete set of drawings, with estimates, will receive an honorarium of 200 guineas.

A MEETING of the Batley Town Council was held last week under the presidency of the Mayor. The general purposes committee's minutes contained a resolution authorising the building of a new town hall at a cost not exceeding 30,000*l.* In connection with this question a letter was read from Mr. George Sheard, of Batley, heartily supporting the scheme, but suggesting that the committee should not put a limit of 30,000*l.* upon the expenditure. He asked that no cheese-paring policy be entertained, but that a hall that would last for ages and be a credit to the town should be erected. Mr. Sheard also suggested that provision should be made for a free library within the same building. The Mayor proposed that the minutes be confirmed, Ald. Nettleton seconding, and their adoption was practically unanimous.

A NEW infant school is to be erected on the grounds of the High School, Inverness. Mr. William Mackintosh, Academy Street, Inverness, is the architect, and the building presents a plain but artistic appearance. It is to be one-storeyed. Two doors are to be provided—one for the boys and another for the girls—and these will lead into a large corridor. There will also be a corridor running up to the centre of the building, an infant-room for seating 150 children, four classrooms, two class-rooms for the use of Standards I. and II. of the juniors, a room for the headmistress and a room for the other teachers. Every attention is to be paid to the ventilation, sanitation and lighting of the new school.

A NEW nurses' home is to be erected at Inverness Infirmary from designs by Messrs. Ross & Macbeth, architects to the Northern Infirmary Board. The building will be situated on the vacant ground behind the porter's lodge, and, facing the south, will overlook the garden. It takes the shape of a pretty villa of two floors, designed in the Scottish baronial style, with crow-stepped gables, and an ornamental turret over the centre. The accommodation to be provided will include on the ground floor five bedrooms, a kitchen and a large dayroom, while on the upper floor there will be eight bedrooms, with bathroom and other up-to-date conveniences. The entrance to the villa home will be at the part next to the infirmary, and provision is made so that at any future time the home may be connected

with the main building by means of a verandah, which, if found advisable, could be carried over the traffic road between the two buildings. According to the accepted contract, the cost of the home is 1,472*l.*

AT the Tunstall County Court on the 13th inst., before his Honour Judge Jordan, an action was brought under the Employers' Liability Act by John Taylor, of Temperance Place, Goldenhill, to recover 30*l.* 12*s.* 4*d.* as compensation for personal injuries from John Beckett, builder and contractor, of Goldenhill, in consequence of a defect in a run or way in a scaffolding. Mr. B. C. Brough appeared for the plaintiff, and Mr. John Knight for the defendant. The case for the plaintiff was that in July last he fell from a scaffolding which had been erected to carry out some work in connection with the building of some ovens for the Birchenwood Colliery Company, Limited, by the defendant, for whom Taylor worked. A day or two before the accident occurred a run or way was made on the scaffolding, under the supervision of the defendant. Two planks were used, one of which, the plaintiff pointed out to the defendant, was too short, and was not stout enough for the purpose. The defendant said the plank was strong enough, and used it. The planks were not fastened, and on July 20, as the plaintiff was passing over the run, the shorter plank slipped, and he fell, sustaining severe injuries. For four months he was unable to work at all, and even now he was only able to do light work. At first the plaintiff sent in a claim under the Workmen's Compensation Act, but the Birchenwood Colliery Company denied liability, and it was also pointed out that the building was less than 30 feet high. Applications were made to the defendant, but he disregarded them. The defence was that the run was perfectly safe, and that the accident was caused by the plaintiff's wilful neglect. While passing over the run he looked in the air and put his foot on the side of the plank, which naturally turned over. The Judge held that the plaintiff did not fall through his own neglect. The story about him looking in the air was nonsense. He gave judgment for the amount claimed and costs.

THE ordinary monthly meeting of the Sheffield Society of Architects and Surveyors was held at the School of Art on the 10th inst., Mr. J. Smith (vice-president) in the chair. Mr. Frank Baggallay, F.R I.B.A., of London, delivered a lecture on "Some Common Errors in Architectural Design."

TRADE NOTES.

THE new Court-house at Cookstown, Belfast, is being ventilated by means of Mackay's patent ventilators, supplied by the sole makers, Cousland & Mackay, 150 Hope Street, Glasgow.

THE new schools, Sandwich, are being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators and special inlet tubes.

MR. S. A. GILLESPIE, land and estate agent and surveyor, of 45 Great Tower Street, has, owing to the rebuilding of the above premises, removed to temporary offices at 36, Great Tower Street.

MESSRS. PECKETT & SONS, Atlas Locomotive Works, Bristol, sent us a handsomely got up ornamental calendar of the "tear-off" description, but it did not reach us in time for inclusion in the list which we previously gave.

A LARGE clock has just been fixed in the parish church of Eccleston, Lancashire, by John Smith & Sons, Midland Clock Works, Derby. It has two dials and strikes the hours on a large bell.

MESSRS. MELLOWES & CO., of Corporation Street, Sheffield, write us that during the recent very severe storm they have not heard of a single instance of damage to their glazing, of which there are millions of feet fixed all over the country. This speaks well for the durability and strength of their work, as many of their roofs have been fixed for some sixteen years.

MESSRS. WM. POTTS & SONS, clock manufacturers, of Leeds and Newcastle-on-Tyne, have just completed in the grand arcade at Leeds a public clock with automaton figures, bells, &c. The dial is of polished copper, while the hands are symbolic of the sun and moon. On each side stands an armour-clad knight bearing a battle-axe, with which he strikes

TO ARCHITECTS, SURVEYORS, &c.

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent"), having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

ARCHITECTS SHOULD SPECIFY

CHING'S Patent Mica Valve Chimney Breast Ventilator, or
CHING'S New Patent Silent Chimney Breast Ventilator.

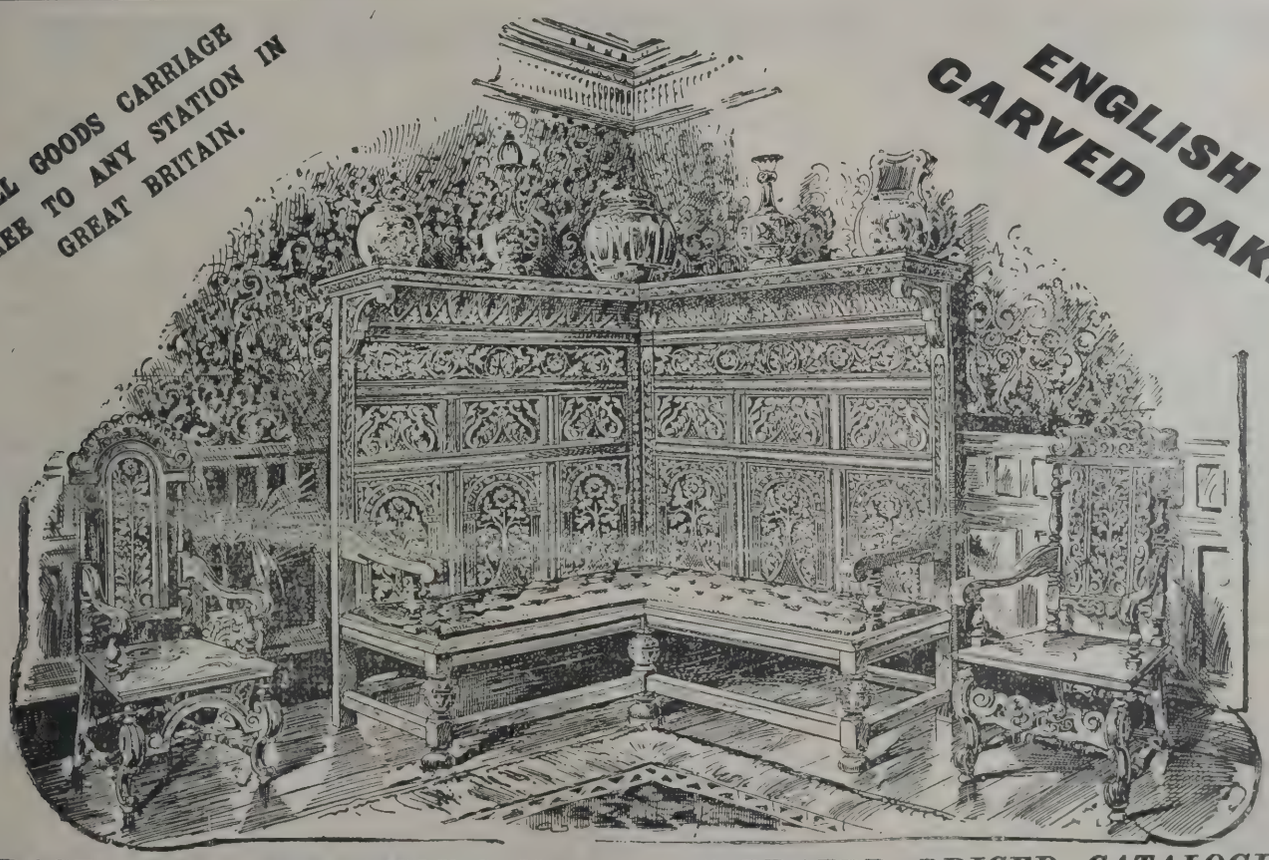
TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM.

the quarter hours upon a bell hung before him. These are the only two figures in view until the hour arrives, when after the quarters and the hour have been struck a door opens and from it emerges a procession of five figures representative of the British Empire. First comes a British soldier, who, on reaching the centre of the platform, faces to the front and makes a military salute. He is followed by a kilted Highlander, an Irishman carrying a threatening-looking shillelagh, a Canadian boatman and a turbaned Hindoo, each of whom in turn faces to the front, bows and marches off. This is not all, however; as soon as the last of the figures has retreated a life-size rooster perches above the dial, flaps his wings and crows three times, and the performance is over for another hour. Messrs. Potts & Sons have designed the clock specially, and have done all the work in connection with its construction. The approaches to the clock are visited by large and eager crowds of sightseers every hour. Messrs. Potts are also fixing a new illuminated quarter-chime clock in the tower of the Leeds parish church for the vicar and wardens.

MR. AND MRS. JAMES CRAIG'S GOLDEN WEDDING.

A VERY interesting entertainment took place at Kilmarnock on the 9th inst., the occasion being the celebration of the golden wedding of Mr. and Mrs. James Craig. Mr. Craig is the managing director of J. & M. Craig, Limited, one of the most flourishing industrial enterprises in the district, and he has been long and prominently identified with the public life of the town. He was a member of the Town Conncil for a considerable time, and acted for several years as a magistrate, his services in both capacities being highly appreciated by his colleagues and the community. He is a justice of the peace for the county. Mrs. Craig is a daughter of Captain Baird, who was one of the pioneers of political reform, and whose name appears honourably in the list of those to whose memory the monument is erected at Strawberry Bank. A large assembly met on the date in question at the Agricultural Hall, and upwards of 1,200 of the employés sat down to tea, during the progress of which numerous loyal and appreciative speeches were delivered, and a handsome gold casket and illuminated address were presented.

VARIETIES.



THE third members' meeting of the Liverpool Architectural Society will be held at the Law Library, 41 Castle Street, on Monday (the 23rd), when a paper on "Enamels" (with demonstration) will be given by Mr. Robert Hilton.

WITH the view of recognising the deep and active interest the Clark and Coats families have taken in Paisley Infirmary for so many years, and of their great munificence towards it in all its schemes, the directors have named the east and west pavilions after these families respectively, and the architect is preparing a design to be inserted in the buildings to perpetuate the honour. The Infirmary, which has been in process of erection for several years, is expected to be ready for occupancy in the course of the summer.

THE new workhouse infirmary at Ripon was formally opened on Friday last. Its site is elevated and healthy, and was formerly occupied by an old block of buildings used for the children's wards. The latter will, on the removal of the infirm people to their new building, be located in the old infirmary wards, which will be ample for their accommodation, and will afford them much better quarters. The new infirmary is two-storeyed, has been erected with local and Leeds bricks, with Pateley Bridge and Killinghall stone dressings. In the central portion, on the ground floor, are the head nurse's sitting-room, with bay window, commanding a view of the river Ure, medical officer's room, store-room, assistant nurse's bedroom, waiting lobby and conveniences. On this floor is a sick ward, 25 feet 6 inches by 23 feet, and 11 feet high, for eight beds, with bath-room. The first floor is reached by two substantial and easy stone staircases. The central portion of this floor contains the head nurse's bedroom, bath-room and lavatories, also labour-room and lying-in-room, while on either side are situated duty-room, special-case ward, sick ward for eight beds, day-room and bath-room. At each end of the building is a balcony, where the patients who are too infirm to get up and down stairs may sit in fine weather. The boilers for warming the building, and for heating the water for baths and lavatories, are in the basement, and a passage 6 feet 6 inches high and 3 feet wide runs from the boiler-house nearly the whole length of the building; along this all the main pipes are taken for the heating apparatus. Accommodation is provided for thirty-eight patients. The cost of the building, which is of a substantial description, is about 2,750*l.*, exclusive of furnishing. The general arrangements of the building have

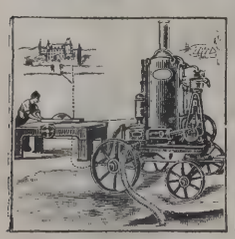
been well considered by the architect, Mr. F. H. Hargrave, of Ripon, the rooms being lofty, well lighted and ventilated, and admirably adapted for the purpose for which they have been prepared.

THE Alexandra Palace is to be rendered additionally attractive in the coming season, which will commence on April 1, by an important Exhibition of Commerce, Manufactures, Inventions and Art which Mr. Cecil Barth, the energetic general manager, is now busy organising, for which exhibits have been invited from all parts of the world and in which they will be placed in friendly rivalry in their respective sections. Applications accepted in each section will be limited in number in order to increase the variety of exhibits and the attractiveness of the exhibition. During the continuance of the exhibition, which it is expected will be one of the most interesting offered during recent years to the British public and our foreign and colonial visitors, there will be a constant flow of attractions to suit every variety of taste, promenade concerts by British and continental bands, chamber concerts by eminent instrumentalists and vocalists, dramatic performances, recitals on the grand organ (one of the finest in the world), refined variety entertainments, brass band contests, aerial shows by the most celebrated gymnasts, acrobats and wire-walkers of all countries, bicycle polo competitions, circuses, menageries, flower shows, bird shows and kindred exhibitions, as well as many side shows of novel and startling description. A great feature will be the performances of the Alexandra Palace Choral Society, under the direction of Mr. George Riseley, of Bristol, consisting of over 1,000 vocalists and instrumentalists. During the season a series of oratorios, commencing with the "Messiah" on Good Friday, March 31, 1899, will be given.

THE unusually high tides and the heavy gales have caused great anxiety as to the safety of Kew Bridge. The ancient structure is undoubtedly in a very shaky condition, and in several places in the buttresses large fissures are showing where the cement has been washed away, while some portions of the balustrades are so weak that no very great effort would be required to throw parts of them over into the river. It is stated that in view of the apprehension which exists, application was contemplated by the local authorities in order to get the bridge examined by the county surveyors of Middlesex and Surrey, as quite three years must elapse before the proposed new bridge could be available for traffic.



THE bridge which carries the Glasgow main road over the river Mennock at the village of that name, about a mile and a half south of Sanquhar, fell on Tuesday morning. A few years ago somewhat extensive repairs were executed on the bridge, but no fears were entertained as to its stability, and its fall yesterday morning came as a great surprise to every one. Fortunately the accident took place at seven o'clock in the morning, when there was practically no traffic, and no one was injured. It was the western side of the south abutment which gave way, and in rushing down to the bed of the river 30 feet below it carried the long wing wall with it. A considerable part of the arch, most of the parapet wall, and more than half of the roadway were precipitated into the river, and the other half so undermined as to make the bridge quite impassable for vehicular traffic. The bridge, indeed, is almost a complete ruin, and as the masonry left standing is of an antique and far from substantial type, a new structure will be necessary. Meanwhile the traffic has been diverted by other routes.

BOTHWELL OLD PARISH CHURCH.

THE old parish church of Bothwell, whose restoration has now been completed, was built in 1398 by Archibald, third Earl of Douglas. It was used as a church, says the *Glasgow Herald*, from that time till 1830, when it was closed and the present new church was built. During the time of the Roman Catholic Church the incumbents were a provost and eight prebendaries. The provosts nearly all rose to prominent positions in the Church and the State. Two of them became Keepers of the Privy Seal, and two were Lord High Treasurers of Scotland. One of them, James Beaton, was afterwards Archbishop of St. Andrews. Since the Reformation the Rev. William Hamilton, the great-grandfather of the late Sir William Hamilton, professor of logic in the University of Edinburgh, Dr. Baillie, the father of Joanna Baillie, and Dr. Gardner, who was moderator of the General Assembly, have been ministers.

The movement for the restoration was begun about two years ago. The first work was to clear away from 2 to 3 feet of earth which from the interments of centuries had accumulated round the walls. The floor had also to nearly the same depth been filled up to make it correspond with the exterior. It was lowered to its original level. When this work was completed it was found that the foundations and walls had a solidity and mouldings that had not been known for several generations.

MERRYWEATHER & SONS, Ld., the Largest Makers of High-Class Hose in the World,

GREENWICH ROAD, S.E., & 63 LONG ACRE, W.C., LONDON; AND AT MANCHESTER.

The stone mullions of the windows, which had disappeared, were renewed. The carvings above the doorway, the sedilia and the piscina were restored. The stone roof has always been a special feature of the church. This has been carefully preserved and put into good order. There are several monuments in the church. One which occupies a prominent position is in memory of the third Duke of Hamilton. He took a leading part in the affairs of England and Scotland at the time of the Revolution. Two were erected to Earls of Forfar, a title held by the heads of the Douglas family at the beginning of last century. The last who bore the title was killed at the battle of Sheriffmuir, and was buried near the large east window of the church. There are also monuments commemorating several members of the family of the Campbells of Woodhall, who for nearly 150 years were the largest proprietors in the parish. A marble tablet of well-executed work commemorates Mrs. Douglas of Orbiston, who left valuable benefactions to the poor; and another is in memory of Dr. Stewart, who was a distinguished medical officer in the Crimean War and the Indian Mutiny. The representatives of these families have put their respective monuments into the best possible order, and by doing so have much enhanced the attractions of the church.

In connection with the restoration a large number of valuable gifts have been received. These include an organ and an excellently-carved case for it, a communion table, communion chair and two side chairs, two gas standards for the chancel and six sconces for the walls, a Bible and hymnary bound in tooled leather, with Scriptural symbols on the boards, and draping for the sedilia. The gifts to the sacristy include an arm and two side chairs, a table, a wardrobe for vestments and gas-brackets. The entire operations have been carried out under the direction of Dr. Rowand Anderson, and amply sustain his reputation in the work of church restoration.

In connection with the restoration movement two new entrances have been presented to the church. Hitherto the main entrance has been by a narrow unattractive lane. This has been closed and a new entrance formed direct from the street. Three blocks of houses have been removed and the ground so cleared away has been laid down for trees, shrubs and flowers, with intersecting walks. A house has been built for the church officer and a conservatory erected for providing flowers for the grounds. In the centre of the ground which has been acquired an exceedingly interesting monument has been erected to the memory of Joanna Baillie, who was born in the Manse of Bothwell. The monument is 16 feet in height. It rests on polished red granite. The material of the body of it is terra-cotta, supplied by Messrs. Doulton & Co., of London, with chastely-ornamented figures. The distinctive feature of the monument is the filling of the four panels with mosaics supplied by the Murano and Venice Glass Company. On the side fronting the street there is a portrait of Joanna Baillie. On another side there is a reproduction of Horatio M'Culloch's painting of Bothwell Castle. On the third there is a representation of the children of Bothwell in the early days of the poetess, and on the fourth the apple and plum trees of the valley of the Clyde. Below each of these descriptive letterpress is given in mosaics, including Sir Walter Scott's well-known reference to Joanna Baillie in "Marmion" and extracts from her writings recalling her early days in Bothwell. The other entrance also greatly enhances the attractions of the village, and secures that one of the best views of the old and new churches be permanently preserved. Old buildings have been cleared away, and a valuable piece of ground has been acquired. This has been planted with trees and shrubs.

THE PROGRESS OF ELECTRICITY.

"THE Progress of Electricity" was selected as the subject of discussion after the monthly dinner of the London Chamber of Commerce on Tuesday. Mr. T. F. Blackwell, the chairman, in introducing the subject, referred to the proposal for an all-British cable. The idea, he said, was worth the serious consideration, not only of business men, but of all Englishmen. It was evident that, in certain circumstances, it would be of the utmost importance that we should have full and entire control of our cables. The proposal would, no doubt, be carefully examined by the proper authorities, and, if it were decided to give effect to it, he was sure the unanimous support of the country might be relied upon. Discussing the question of telephony, he expressed the opinion that it was very desirable, in the interests both of commercial men and of the general public, that the telephone should be under the control and management of the State rather than of a private company. The London Chamber of Commerce had recently passed a resolution to this effect, and he hoped the day would come, and come quickly, when the Government would take over the whole service. Legislation, he thought, had very much hindered

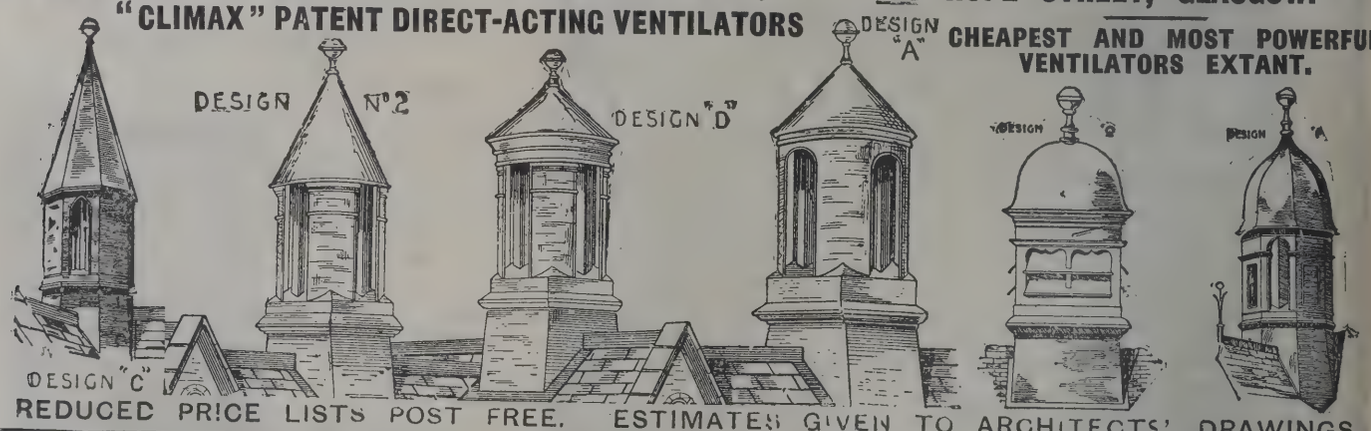
progress in the matter of electric lighting. It was a subject of regret that corporations and municipalities had not shown more courage in dealing with the question; at the same time, he could not but express the feeling that private companies had been very unfairly treated by the legislation which had been passed in recent years. He was glad to see that electric traction was coming rapidly to the front. Its general adoption would be an immense convenience to Londoners.

Mr. S. Morse, chairman of the Electrical Trades Section of the Chamber, said that electricity had not received fair play in the past. It seemed to be the opinion of successive Presidents of the Board of Trade and of Parliamentary committees that the science should not be encouraged, but scotched. He was afraid that, unless a great effort were made, still greater obstacles would be placed in the way of the progress and development of electricity, and the great object the London Chamber of Commerce had in view was to prevent so undesirable a purpose from being accomplished. There were now some 11,000,000*l.* invested in supply companies or in local authorities undertaking the supply of electric lighting throughout the country. This fact was an indication of the great progress that had been made in spite of all difficulties, and of the enormous proportions to which the enterprise had grown.

Major-General Webber said it was with the greatest regret that he had heard that the Chamber had adopted a resolution which, he was afraid, would be likely to kill the telephone industry in this country. He could not help feeling that this resolution was taken without the Chamber having the fullest knowledge on the subject before it. The telephone, he claimed, was essentially a local, and not a national industry. All the difficulties which the National Telephone Company had had to surmount, and which the Post Office would have to surmount if it undertook to telephone the country, were purely local, and he sincerely hoped that the Chamber would pause before finally and irrevocably committing itself to the idea of the State's controlling the service. In all those countries where nationalisation had taken place the progress had not been so great as in the countries where the telephone industry had been carried on and managed locally.



Mr. E. Garcke said it was no use, even after dinner, lulling themselves into the belief that they had cause to be satisfied with the progress of electricity in this country. If they compared the history and progress of the science here with its history and progress in other countries, they had to deplore the fact that they were even to-day many years behind almost every civilised nation of the world. He believed the primary cause of this was the tendency towards municipalisation which had been, he might almost say, rampant during the last twenty or thirty years. It was impossible for private enterprise under these conditions to make that headway which was absolutely necessary for the development of the industry. Almost every department of electricity had suffered from the same cause. He differed from many authorities in thinking that the telephone service in this country was quite as satisfactory as the service in America or on the Continent. It was true that the Continent had an advantage over them in the matter of price, but that disability had been inflicted upon them by the vacillating policy of successive British Governments. As to electric traction, he believed that if they made the mistake of encouraging the municipalisation of tramways they would retard the progress of an industry which had done, and was going to do, more for the development of other industries and for the progress of civilisation than anything else.

Other speakers also took part in the discussion, which closed with a vote of thanks to the chairman.

CHELSEA PHYSIC GARDEN.

THE corporate property, charities and endowments committee of the London County Council have recently had under their consideration a draft scheme prepared by the Charity Commissioners for the necessary modification of the existing scheme governing the City Parochial Foundation for the future regulation of the Chelsea Physic Garden, a charity established in 1721 by Sir Hans Sloane, who conveyed the fee of the land, about three acres, forming the site of the garden and buildings, to the Society of Apothecaries as trustees, reserving a nominal rent of 5*l.* per annum, and subject to the garden being maintained for the purpose of botanical and medicinal study, and for supplying the Royal Society with specimens of fresh plants every year. The scheme provides that the City Parochial Foundation, who are prepared to make a grant of a capital sum and a maximum yearly amount of 800*l.* for maintenance, shall be the trustees in lieu of the Society of Apothecaries, who, it is understood, desire to be relieved of their trust. It is proposed to provide a museum, a lecture theatre, a botanical laboratory and a biological laboratory, partly in the existing buildings and partly in new buildings, which, it is anticipated, will encroach on the garden to the extent of only one-eighth of an acre. The charity is to be

administered by the trustees and by a committee of management. The committee of management are entrusted with the direction of the garden and of the work of the garden. They are to be fifteen in number and appointed as follows:—Eight by the trustees of the London Parochial Charities (one-half of whom are to go out of office every two years); one by the Treasury, for five years; one by the Technical Education Board, for three years; one by the Royal Society, for four years; one by the Society of Apothecaries and the Royal College of Physicians in turn, for two years; one by the Pharmaceutical Society, for four years; and one by the University of London, for four years. Provision is made for the appointment of a curator and other officers. By Clauses 28 and 29 students of institutions aided by the City Parochial Foundation are eligible for admission to the garden without payment of fees, and, so long as a yearly payment of 150*l.* is made to the trustees out of moneys provided by Parliament, free admission is to be given to students and professors of the Royal College of Science. After a careful consideration of the scheme, the committee of the London County Council consider that certain modifications are desirable, and their observations on these questions have been transmitted to the Charity Commissioners. The committee think, among other things, that the name of the Council should be substituted for that of the Technical Education Board as the body to appoint one member of the committee of management, and that a special clause should be added providing for the appointment of additional governors under the Technical Instruction Act, 1889. They also notice that by Clause 27 "rules shall be made by or with the sanction of the Charity Commissioners for admission to the garden." This, they assume, is intended to cover the admission of the public on suitable occasions; if, however, this is not what is intended, they think it highly desirable that the Commissioners should be approached with a view to the clause being extended.

HOUSES FOR THE POOR.

THERE was a discussion of the subject of the housing of the poor in large towns at the meeting of the Manchester Statistical Society on the 11th inst.

Mr. B. F. C. Costelloe said the difficulties of urban life had been brought home to the London County Council with exceptional keenness, for the aggregation of human beings which formed the capital of the British Empire far exceeded in magnitude any such aggregation which existed or ever had existed since men began to live in society. The County Council area contained about as many people as Paris, Berlin, Vienna and Rome put together. Neither Imperial Rome at its greatest nor any modern civilised city had had half such a population. Again, one had to remember that of this vast aggregate of human beings the vast majority were poor. According to Mr. Booth, a million and a quarter of them—say a fourth of the whole—were living below what he called the line of poverty. Nowhere was it so difficult to estimate exactly the state of labour and wages and the real conditions of life of the poorer working class. In a district like Manchester and its area work was comparatively regular. There were staple trades, and hands whose skill in them was—saving periods of depression—a constant probability of good wages. That was not true of London. Wages were, in some relations, higher there than elsewhere, but work was wofully irregular. What, then, was the housing problem? It was not merely that at least a million of Londoners—say a fifth—were housed now in a way inconsistent with what we understand by civilisation. The census figures as to overcrowding alone were terrific. The medical officer lately reported, as the measure of "housing" required, 829,765 persons living in tenements of four rooms or less, occupied by more than two persons in a room, of which 214,843 persons lived in tenements of one room, and 330,238 in tenements of two rooms. The bulk of these, in his opinion, needed in reality to be rehoused. All municipalities, however, had experience of overcrowding and of insanitary slums In London they were the worse because the administrative chaos and the leasehold system had directly encouraged both these curses of the community. The metropolitan slum areas were of vast extent, taken as a whole, but they were the more unmanageable because they were scattered everywhere over the map of London. Why, it might be asked, were there in this way slums in all quarters of London? The answer was undoubtedly to be found in the bald political economy of supply and demand. The conditions of London life had been and were such that there were masses, large or small, of the very poor who were wanted in all these places, and who could not very well live anywhere else. There were numerous sections of the community who were compelled by the nature of their employment to dwell near the centre. They must live near their work. If we could abolish

THE SIMPLEX STEEL CONDUIT SYSTEM.

Immediate Delivery from Stock of all sizes of Conduit and Accessories.

all such casual labour, and have industry so well organised that all the workers should have practically regular work and should know just when and where to go for it; then the poor labourer might do what the aristocracy of labour did now—migrate to the suburbs, or to outside areas like Tottenham, where there were cottages to be had with gardens—of sorts—and where a whole city emptied itself every morning into London by rail, and flowed back again at night. If the whole of the million and a quarter who must be housed and who were "below the line of poverty" were at least living by organised and regular employment, the problem would be comparatively simple. It would then mean, in effect, the building of other outlying suburbs of workmen's homes outside the business area, and the provision of cheap and rapid transit for the workers in and out at all needful hours of day or night. But all talk about planting out the workers in the green fields and solving the problem by rapid transit was really an evasion of the true difficulty. The fact was that a large fraction of the poorer workers could not reasonably be expected to live ten miles, or even five or three, from their work. In modern wage-earning it was more than ever a case of "first come, first served." A multitude of poor workers' families must live near the centre, and the land near the centre has attained a value the equivalent of which they cannot conceivably pay, and it goes on increasing with fatal certainty. If Whitechapel, and Stepney, and Limehouse, and Mile End, and Bethnal Green, and Shoreditch and Spitalfields were all depopulated, as they may well be, where will these myriads go? This problem no one has seriously faced. To say that it should be left to settle itself seems to be one of those inhuman counsels which are the seed of revolutionary discontent, and bring on in the end more violent remedies than even the extremists would wish. To say that the community should buy up slum areas and re-erect on them an adequate number of workmen's dwellings under present conditions of cost is almost appalling. The Metropolitan Board of Works cleared 22 acres at a net loss of over a million and a half. Other towns, such as Glasgow and Birmingham, have turned these operations into speculations almost remunerative; but in London it is absurd to propose it. We must be prepared, if we go in for municipal housing of this kind, to face the fact that we will be sacrificing vast portions of the possible economic value of sites in the very centre of the world, and will be providing homes for certain needful servants of the community at wholly artificial rents. It ill b e said that to do this is to "pay rent out of the rates" for a favoured class. To that the London County Council will certainly not allow itself to be driven except in the last resort. Can the London County Council, or Parliament or anybody else avoid this necessity in the long run if we are really in earnest about the housing of the casual poor in London? A man may say, of course, that there ought to be no "casual" labour; and that if there were not, all workers could have lovely cottages in the country. If that is the view, then let us set about the colossal work it involves. Let us settle how this new province of cottages is to be built, so that it may not make new horrors as it too often does now, not only in London, but in provincial cities because it is beyond the boundary of strict supervision. Let us root up all the irregular employment and arrange hours everywhere so that it is possible for the workers to travel to and fro. Let us see that railways and fast trains, private or public, develop rapidly the zone of ten miles round the present London, with radial lines and convenient stations so that every workman cottager can get to a central point in about half an hour from his own door, at intervals of, say, a quarter of an hour, any time from 5 A.M. till 8 A.M., and return in like manner any time from 5 P.M. till 9 P.M., at rapid intervals, and any time until the next morning where the night-working trades are concerned. The thing can be done, though it is a colossal work, at which the existing companies have only nibbled as yet. Many say, and say truly, that much of the present shame and misery arises out of the abuses of the private ownership of land values. The community should be able to expropriate land for its necessary purposes on a very different system from any we have known as yet. Even if the community owned the land, the casual housing problem would be in its essence the same. For the real point of it is that this casual labour has to be housed at places where any bedroom may be worth 100*l.* a year. We may obscure that fact, but no jugglery will abolish it. "Paying rent out of rates" is discussed in the *Times* as if it were a question of Progressive extravagance or electoral corruption. But the whole scheme of the Housing Acts of Parliament is built on the principle that the rent of these slum workers, when they are rehoused, is to be largely "paid out of rates." From that result there is no escape so long as people must sleep near their work. If society cannot arrange that its industry shall be so organised as to abolish the difficulties of this casual labour, bound to the centre of a town, then society must be content to pay the rent of a sufficient corps of hangers-on. It is not a pleasant dilemma, and neither horn of it is easy. But all dilemmas are

McNEILL'S FELTS Roofing, Inodorous, Sarking, Dry Hair, Damp Course, &c.

PATENT
VULCANITE ROOFING

Since the introduction of the patent Vulcanite Roofing into this country it has been adopte by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospita Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summ than under any other roof. When properly laid repairs are never required, and all roofs a guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGE TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower a quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and fo SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 supe ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

Vol. IX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C

simpler after we have faced them, and all are capable—and certain—of a solution.

Alderman Walton Smith said it was with almost a sense of relief that he found that the difficulties encountered in Manchester in connection with the housing problem were small in comparison with those which the London County Council had to deal with. In Manchester the Corporation were seeking to get the railway companies to establish three zones, and to issue tickets at 1*d.* each for two miles, 2*d.* for six miles, and 4*d.* for those workers who lived within the ten miles zone. Tramways would, in some respects, be of greater benefit than railways, because they went around the city and intersected it in various ways. He hoped that when the electric system was established in Manchester still greater facilities would be afforded in this direction, and thus enable the working classes to find a home in the surrounding districts.

Mr. Pownall said it was obvious that these poor people could not help themselves. The question, then, was—From whence is the help to come? Private enterprise could only palliate the evil. The help must come, it seemed to him, from the State. Was the State prepared to make the sacrifices necessary to bring that comfort to the workers without which there could be no true contentment? It seemed to him that the first step towards a better state of things was to reform the laws affecting the tenure of land and secure effective building regulations.

Mr. A. H. Scott pointed out that the evil which everyone recognised and deplored would only be partially remedied if people were forced from the centre to the circumference of the city, and there allowed to recreate fresh areas of slums.

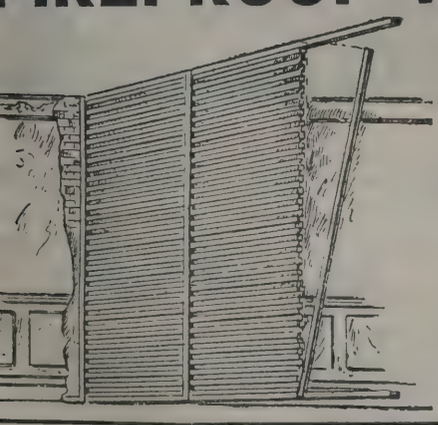
Mr. F. Brocklehurst said they were doing their best to provide houses for the working classes of Manchester. The improvement and building committee had either built, or were engaged in building, eighteen five-roomed cottages, 634 tenements and twenty-nine shops, besides a public lodging-house for men. The barrack buildings were gradually being abandoned. It was true those now in Manchester were full, but it was because the people had nowhere else to go. They were strongly disliked, and it was largely owing to the expression of public opinion on this question that barrack buildings were now being abandoned.

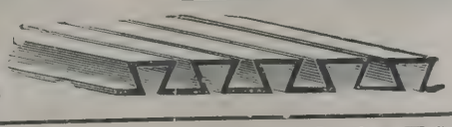
The Rev. J. E. Mercer said that many of the evils engendered by congestion in the centres of Manchester were rapidly developing in suburban districts like Gorton, where "jerry-building" was rampant, where there was a population of 40,000, and where the building by-laws, although thirty-five years old and intended for a rural district, were not acted up to, and where the population was increasing by ten or fifteen hundred every year.

Mr. T. Gregory suggested that if the local authorities provided houses at an abnormally cheap rate the benefit would pass, not to the occupant, but to the employer, who secured labour at a lower rate in consequence.

Professor Flux expressed his belief in the possibility of effecting such changes in industrial conditions as to make it no longer imperative for any large class of workers to live in close proximity to their work.

Mr. Plummer said that the building of workmen's dwellings and the purchase of sites by the Manchester Corporation, viewed as a commercial transaction, was an absolutely hopeless failure, and one they could not hope to repeat.





"DEAD ENDS" OF MAINS.

IN his last report to the Kensington Vestry, Dr. Dudfield, the medical officer of health, writes :—

The public analyst has had occasion recently to report unfavourably upon a sample of water taken from a house in St. James's Square, his report being to the effect that "the sample consisted of water polluted, and totally unfit for public supply and drinking purposes." The Grand Junction Waterworks Company, who supply the district, upon being communicated with took exception to the source from which the sample was taken, being of opinion that "a sample of water drawn from such a place and under such conditions would be very unlikely to be a fair sample of the water as delivered from the company's main." They stated that they had received no communication from their own analysts with reference to their water, which is analysed daily by those gentlemen—Sir William Crookes and Professor Dewar, chemists of the highest professional reputation. Other samples were subsequently taken from houses in the square and examined by the public analyst, who had again to make an unfavourable report. In the circumstances it appeared to your vestry desirable to apply to the Local Government Board to have reserve samples examined by Sir Edward Frankland, whose reputation as a water analyst is second to none. The Board's reply was to the effect that they "could not undertake to arrange for the analysis by Sir E. Frankland

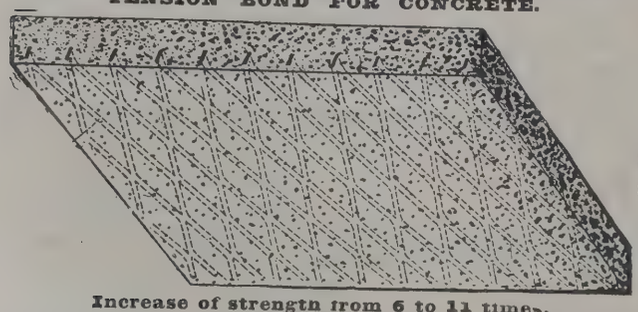
of samples of water supplied by the vestry." The special purposes committee have had an interview with the secretary and the engineer to the company, and have inspected the plan of the mains in the district, it being a statutory duty of the company to provide such plans, which are required to be open to the inspection of persons interested. Examination of the plan revealed the fact that, practically, though not actually, the main from which the samples had been taken terminates in a "dead end," a condition of things which tends to sluggishness of flow of the contained water, and favours the growth of organisms, unless the main is flushed and cleansed with sufficient frequency. The officers of the company stated that this is done, and no doubt proper instructions are given. But in the case in point these instructions may not have been carried out; in other words, the main may not have been flushed and cleansed with necessary frequency. The engineer admitted the necessity for this treatment, and promised that the matter should receive proper attention. The samples of water submitted for examination by the company's analysts are taken from a standpipe, and from a main in which the flow is active and practically incessant. The analyst's report for each day in the month of November was favourable, every sample being returned as "clear." But such a report upon samples of water taken under the prescribed conditions is not inconsistent with impurity of a supply derived from a main conditioned like that in St. James's Square. There can, I think, be no reasonable doubt that danger to the public health is involved in circumstances which tend to slow the flow of water, whether by actual dead-ends of mains or (as in the St. James's Square case) under conditions analogous. The engineer stated that the company were, and for some time past had been, engaged in abolishing dead ends; it is to be hoped that the recent stir will have the desired effect of stimulating their activity in this direction. Quite recently Sir Edward Frankland has had occasion to direct attention to the ill effects of dead ends of mains, in a report on the water supply at Paisley, where an epidemic of enteric fever was probably due to a gross defect in the apparatus for flushing dead ends.* The conclusions of this analyst with reference to dead ends, as set out in the report on the Paisley case, are as follows:—

"1. That chemical analysis has shown the water in the dead ends of the mains to be organically somewhat inferior to that circulating in the trunk mains, both of the high and low level services.

"2. That the bacteriological examination has shown the water in the dead ends of the mains to be, in almost every case, somewhat richer in bacterial life than the water circulating in the large mains of both supplies.

"3. That colon bacilli, and other forms more or less resembling the typhoid bacilli, have been found in six of the twelve samples collected from the taps in the affected area, whilst no suspicious forms were discoverable in the two samples taken from the trunk mains.

"4. That all the four samples taken from plugs inserted in the dead ends of mains in the affected area contained colon bacilli.



"5. That whilst the results referred to above do not actually prove a connection between the water supply and the recent epidemic, they are obviously quite in harmony with the existence of such a connection.

"6. That on general grounds the water in the dead ends of mains is most calculated to cause mischief, because in the event of any dangerous contamination of a water-supply having taken place, the morbific material (typhoid bacilli) will tend, not only to accumulate in such areas of sluggish circulation, but they will also remain there for a longer period of time than in any other part of the network of mains. The water consumer in such an area will, therefore, not only be more likely to receive typhoid bacilli, but will receive them in larger numbers and over a longer period of time, and there is thus a greater probability of his infection being secured. These considerations show the high importance of the regular and frequent flushing of all such dead ends being carried out, and the serious danger to the water consumer of any want of attention to this duty."

It is only fair to say that, so far as I know, typhoid bacilli have never been isolated from the water supplied by any Metropolitan company. None such were found in the samples reported on by the public analyst, nor were any discovered in the Paisley water; but the final observation by Sir Edward Frankland contains a warning as to the danger of dead ends which should be taken to heart, for whilst "unable to pronounce any authoritative judgment as to the origin of the recent epidemic," he is of opinion "that the remarkable restriction of

* The defect referred to consisted in the "system which prevails in Paisley of making a direct connection between the water mains and the sewers," described by Sir Edward Frankland as "one of the most serious breaches of the laws of hygiene" which he had met with in the whole course of his experience, "and which it is impossible to condemn in sufficiently strong terms."

the epidemic to an area in which an extraordinary large number of dead ends of the water mains occur, points to the particular dangers attending such dead ends," to which he had referred in his report "as being a *causa sufficiens* of the mischief." The lesson to be learned from our recent experience, perhaps, is that water for examination by the public analyst should be collected from small mains and near to dead ends. If the water proves to be satisfactory in such localities, there will be no question of its fitness for potable use in trunk mains where the flow is active and constant.

SCHOOL FOR THE BLIND, LIVERPOOL.

THE new school for children at Wavertree in connection with the Liverpool School for the Indigent Blind was opened on the 12th inst. by the Lady Mayoress of Liverpool. The building is most pleasantly situated, the committee having secured one of the few remaining open spaces within a reasonable distance of the centre of the city. Standing well back (150 feet) from Church Road, and approached by a drive lined with shrubs, the building looks very well with its facing of grey brick, the windows, doors, gables, &c, dressed with red Ruabon brick, and the roofs covered with grey Velhinelli slates. Money has not been needlessly spent in external decorations—it is a mistake to use much of public subscriptions in outside architectural embellishments—yet the elevation and general appearance of the block are very satisfactory. As seen from the drive the building is flanked with two wings, one providing a gymnasium connected with the main building by a covered corridor, and the other providing the sick ward, dining-room and general kitchen accommodation. The principal entrance is in the centre of the main block, and opens into a vestibule and hall, in the former being a large showcase for the display of goods made by the blind in the school. Turning to the left we enter a large showroom and board-room, beyond which is the master's sitting-room. Beyond that is the boys' staircase and the corridor leading to the gymnasium. This hall is 40 feet by 25 feet, with a height from the floor to the boarded pitch-pine roof of 21 feet. Like the rest of the building it is lined with buff and red brick above a glazed brick dado. The flooring is also pitch-pine, laid on a sub-floor of concrete, and the large windows at each end are filled with lead glazing designed by the architects.

Returning to the main building, the rear of it is found to be occupied opposite the boys' staircase with a lavatory and cloak-room, and a range of six class-rooms, all well lighted and separated from each other by glazed screens, which admit of the complete supervision of the children. On the right of the main entrance is a waiting-room (with telephone), master's office and officers' dining-room. The girls' staircase, which is thus separated by 90 feet from that for the boys, is at the right end of the main block. But on the same floor in the right wing is the sick ward (facing the front), with suitable accommodation for the nurse and patients; in the middle of the wing girls' lavatory accommodation, while the rear part contains a dining-hall, 47 feet 6 inches by 18 feet 6 inches, communicating with a large serving-room and kitchens. The first floor is devoted to dormitories for the children and bedrooms for the officers and servants, the accommodation for the latter being in the wing immediately over the kitchen. The dormitories seem to be well arranged, and an excellent feature is the direct supervision which can be exercised from an officer's bedroom over each dormitory. The basement is extremely well lighted, nearly all the windows being above the level of the surrounding ground. The front part of the basement has a work-room 57 feet in length, while on the other side of the corridor are day-rooms and bath-rooms, the basement of the right wing containing wash-house and similar accommodation. A double lift is provided, and the building is fitted throughout with telephonic communication. The corridors and floors throughout are of concrete, with a granolithic surface; the staircases are of stone with glazed brick dados. The rear of the building looks upon a court in grass, with shrubs, and beyond it are separate playgrounds for the boys and girls.

The cost of the building (exclusive of site and furnishing) slightly exceeds 14,000*l.* The design and general architectural work were supplied by Messrs. H. & A. P. Fry, architects, Hackinshey. The general contractors were Messrs. Morrison & Sons, Wavertree; Mr. Wm. Hughes was clerk of works, and the various tradesmen employed were:—Ironfounders, Guy & Hunter; plumbers, A. C. Wilby & Son; glazing, Williams & Watson; heating and hot-water service, Killick & Cochran; gas service and fittings, the Liverpool Gasfittings Company; electric bells, telephones and lightning conductor, H. G. Riddell; roof ventilators, Braby & Co.; service lifts, Waygood & Co.; locks, College & Bridgen; grates and chimney-pieces, Yates, Heywood & Co.; wrought-iron work, Cunliffe & Dean; trough closets, Doulton & Co.

FACTORY STAIRCASES.

THE negotiations between the manufacturers' section of the London Chamber of Commerce and the London County Council respecting the "County Council Staircase" have, says the *City Press*, been brought to a fairly satisfactory conclusion. The difficulty which gave rise to them, however, ought never to have occurred. The Factory Act of 1891 made it obligatory on owners and occupiers of factories to provide efficient means of escape for employés in the event of an outbreak of fire; but it expressly stated that they should be such as could "reasonably be required under the circumstances of each case." The words are clear enough, and occupiers of premises coming under the Act were therefore not prepared for the action of the County Council in demanding in every case the construction of a costly fireproof staircase without any regard to special circumstances. It was not alone the excessive cost that was complained of, the loss of valuable space caused by making extra staircases, or enclosing existing ones, and the general interference with business accommodation were still more serious. In many cases—in the City especially—compliance with the demand was well nigh impossible. The matter was finally taken in hand some months ago by the London Chamber of Commerce, and the committee to whom it was referred have just announced the result. They have "received an assurance that the Council had no intention to increase the difficulties of owners or occupiers of property by excessive requirements." It is promised that in future, "should it be considered by the factory or workshop owner, or his advisers, that suitable means of escape in case of fire can be provided from the premises in some other way than that indicated" in the Council's official requisitions, the Building Act Committee will be prepared to give full consideration to any alternative proposals submitted to them. It is a great pity that these assurances should have been delayed so long, and when it was found that the Council's requisitions "were so worded as to convey the impression that they were in the nature of mandates, and that no alternatives could be accepted," that the mistake was not corrected. This mistaken impression was not confined to the persons upon whom the notices were served and their professional advisers. The officers of the Council read them apparently in the same sense, and considerable sums that might have been saved have been unnecessarily expended. Everything now depends upon the spirit in which the "assurances" of the building committee are acted upon, and perhaps it is just as well that the committee of the London Chamber of Commerce are continuing their sittings for the present. There may be many occasions on which their advice will be useful, and they will, at all events, be in a better position to judge how far the assurances they have received are carried out in practice. In the meantime manufacturers and property owners who are the recipients of requisitions from the London County Council are recommended to consult their professional advisers as to alternative proposals, taking care that in such alternatives the requirements of the law are reasonably met. There is, of course, no valid objection to the requirements of the Act. It is the duty of every employer—apart from any legal obligation—to see that the means of escape in the event of fire are provided for the persons in his employ; the Act itself demands nothing more. It does not insist upon costly fireproof staircases; that is the idea of the County Council, and it is against this only that the protest has been made. Had the demand of the Council been brought within the limits defined by the Act they would have had very little difficulty in enforcing it.

PATENTS.

The Architect.

THE WEEK.

A SMALLPOX hospital is not a desirable addition to a suburban district, and inhabitants are to be excused if they have recourse to indirect means for raising obstacles to its erection. The provision has to be made, but no district cares to have the privilege of possessing it. A curious instance of the extent to which opposition can go was exhibited in the Court of Appeal on Saturday. A site was purchased on Whitmoor Common, near Worplesdon, in Surrey, on which a smallpox hospital was to be erected for Guildford, Godalming, and Woking. In last September a contract for the work was entered into with Mr. JOHNSON. It was stipulated that he was to avoid all unnecessary damage to the common, and to replace any turf which might be removed. About a month after the works had commenced the commoners applied for an injunction against the hospital board and the contractor to restrain them from carting materials across the common. A temporary injunction was granted. Afterwards an order of the court was made by which the defendants were to limit interference to a track to be set out by a surveyor that the court would nominate. The commoners appealed, and asked for an unqualified injunction. The court said the real nature of the contest was obvious, but as the plaintiffs' rights were protected by the ordinary remedy there was no necessity for such an injunction as was sought. It was true defendants were carting bricks along a track of the common, and at one part of the track it would be necessary to cut up the turf, but to suppose that the defendants could ever acquire thereby any rights over the common was out of the question. The appeal was therefore dismissed.

THE prison of Sainte Pelagie on the Rue du Puits de l'Hermite, Paris, is to be demolished. A week ago the privilege of doing the work and acquiring the materials was set up for sale by auction, but as the starting price was not to be less than 17,000 francs no house-breaker was discovered with sufficient enterprise to offer that sum. It will be necessary for the authorities to make a large reduction of the amount demanded. The building was originally a convent, founded in 1665. At the time of the Revolution it was utilised as a prison for the suspected men and women who were considered enemies to the Republic. It was, in fact, a resting-place on the way to the guillotine. Madame ROLAND remained in it long enough to write her Memoirs. At a subsequent period a part was used for condemned criminals and a part for political offenders. Many distinguished French authors have been confined in it. Anything which could be considered as possessing historical interest has been reserved by the authorities, including doors of cells tenanted by notabilities, and windows on which they had scratched their names. The prison retained many of the expedients which were supposed in old days to be efficacious in reforming culprits or for moving them to repentance.

THE old question whether photographic portraits are works of art, and therefore entitled to protection against imitations, was raised on Friday last in one of the French courts. A trader had issued a prospectus which was embellished with portraits of several actors and actresses. They were copied from photographs taken by M. REUTLINGER, and he had sent copies to the persons represented. There was no doubt that they had approved of the copying, but had they any right in the photographs? After a long course of argumentation the court decided in favour of the photographer. He was declared to be an artist in the eyes of the law, his art consisting in the posing of the figures, arrangement of the lighting, and selection of the suitable moment for seizing the likeness. He had copyright in his plates, and the person represented, whether he had paid or not for the photography, could not authorise a reproduction of the plate. It was only by a written agreement that the right could be ceded. The photographer was awarded 500 francs as damages, and the issue of the prospectus was prohibited. The decision has caused much surprise, especially to "celebrities."

IN April 1896 the reparation of Winchester Cathedral was commenced, and works of the value of about 12,000*l.* have been since carried out. They include the whole of the main roof of the nave and the stone vaulting, which was in a critical and dangerous condition, the north transept and its aisles, the choir and the south aisle of the same, together with some repairs to the timber of the central tower. Further repairs are still needed at the roof of the south aisle of the nave, estimated at 1,060*l.*; the large, flat roof of the retrochoir and its aisle, estimated at 1,065*l.*; and the eastern aisle of the south transept, estimated at 435*l.* When they are complete the whole of the main fabric of the vast cathedral (the largest church in Europe, except St. Peter's at Rome) will have been put into a state of such sound and solid repair as will secure its stability for many generations to come. The whole of the work has been executed by Messrs. THOMPSON of Peterborough, under the superintendence of the architectural surveyor, Mr. COLSON, whose plans for strengthening the nave roof and relieving the pressure of the timber on the vaulting received the approval of Sir J. WOLFE BARRY. The Dean and Chapter still require about 4,400*l.* to pay for the contemplated works and to settle the accounts for the works executed, and they trust that many persons outside the diocese will aid them in preserving a building which possesses not only architectural beauty and grandeur, but from its many historical associations, stretching back to a remote antiquity, occupies a high rank amongst our great national monuments.

THE last quarterly number of the *Journal* of the Royal Society of Antiquaries of Ireland is marked by variety and interest. Papers on WALTER FITZGERALD, a sixteenth-century outlaw, the district of Kileton, the lake and church of Kilmakelloge, Dunbeg Fort, Mount Merrion, prehistoric remains in Burren Ogams (three papers) and other subjects are as diversified as any reasonable archæologist could desire. In the notice of Mount Merrion, near Dublin, there is reference to Lord FITZWILLIAM, the founder of the museum which bears his name in Cambridge. He was one of the old school of dilettanti. He had several paintings of the demesne executed by WILLIAM ASHFORD, the first president of the Royal Hibernian Academy. We are told, "His life was spent in collecting rare books, illuminated manuscripts, pictures, drawings, which he bequeathed to the University of Cambridge, together with 100,000*l.* for the endowment and building of the museum. He was a man of an enlarged and liberal mind, kind and compassionate, and being easy of access to all, his great collections were, during his lifetime, ever open to the view of those who cared to see them." The earl died in 1816, and his Dublin estates passed to his cousin, the Earl of PEMBROKE.

IT was expected that the old Greyfriars church in the quadrangle of Marischal College, Aberdeen, would be allowed to stand by the Corporation of Aberdeen, who appear to possess absolute authority over the building. But from what was said on Tuesday at the meeting of the Aberdeen Ecclesiological Society, sentence of demolition has been passed. This is a loss not only of an interesting specimen of Gothic architecture, but of a feature that imparted interest to the old and new University buildings. According to Professor MATTHEW HAY, the scheme of the University Court, embodying the retention and repair of the ancient church, was the only one which would have been likely to be carried out within a reasonable time. Promises of money amounting to something like 28,000*l.* were given, and within two or three years a beautiful frontage to Broad Street could have been presented in stone and lime. There was not any chance of any other scheme going on, because there was no money for it. They were exceedingly sorry at the possible demolition of the old church, which was the only remaining part of the buildings that originally belonged to the University, and even on that ground alone its removal should be deplored.

THE TEMPLE OF MUT IN ASHER.*

IN most of the occupations which ladies have followed of late years, to the surprise of old-fashioned folks, they are simply imitating ancient precedents; but the authors of "The Temple of Mut in Asher" are, we believe, the first women who have had the courage to undertake the exploration of a temple. Probably they will not be left alone in their glory, and will hereafter be considered as only pioneers in a movement for which ladies will say they are better qualified than men. In this case the experiment has been so far as successful as any Egyptologist could desire. The work is not ended, but an immense quantity of masonry is revealed, together with many statues, statuettes, inscriptions and other objects. What to one class of readers will be more important is the evidence unearthed of the exalted position occupied by womankind in ancient Egypt. One temple superintendent takes pride in the circumstance that he was "born of ABU, the lady of the house." The superintendent of the Treasury, not to be outdone, declares his father was one UAZMES, a doctor, but his mother was "AAHMES, the lady of the house." There was inheritance through the mother, and if a woman could not always reign, she could marry her brother if he were a king, and in that way become a joint possessor to the throne. Architects and builders must have been anxious for queenly rule, especially if all princesses resembled HATSHEPSUT, who after aiding her father THOTHMES I. as co-regent, became the wife of her brother, who was seven years younger than herself. The authors tell us "her reign was what a queen's should be in its foreign relations and in the progress of its arts and the piety of the ruler. It was religious and rich in temple building." That statement is enough to compel us to become interested in the book, and in any others which the authors will produce.

We are supposed to possess a more authentic record of the history of ancient Egypt than of ancient Britain. There are also so many references to public works as to constitute a guide-book. Yet the Temple of Mut was ignored by all with the exception of the donkey boys. It lies between Luxor and Karnak, and was therefore in a region which is familiar to foreign visitors. The appearance of the remains in 1894 is thus described:—

> The gateway into the first court was filled with earth nearly up to the top. A few yards to the north of this lay yet another gateway, and between the two a triple line of sphinxes. The creature next to the northernmost gate has a man's face, which looks serenely out of the choking earth. From this gate a grove of feathery tamarisks stretches northwards again to Karnak, and beneath the tamarisks runs yet another avenue of mouldered sphinxes. The temple itself was so much destroyed and the broken walls so far buried that one could not trace the plan of more than the outer court and a few small chambers. The walls of this outer court were banked up slopingly with earth, and out of the earth bank came here and there at short intervals a lion head in black granite or the headless shoulders of a woman's figure. The figures were scattered irregularly—at one place a group, at another a single mutilated head, and again two figures close together leaned towards one another as if they were secretly lamenting the downfall of the great gods. On the east side of the court a doorway opened, and where the mounded earth grew level a flagged pathway led to a little shrine high on the sand heaps. At the far end of the temple a lion-headed figure, quaintly whitened by saltpetre from the soil, stood out against the background of the lake.

The site now presents a very different appearance. Enough has been done to allow a plan to be prepared. Apparently the temple enclosure was surrounded by a brick wall. Outside there was one sphinx, if not more, guarding the entrance. After passing through a pylon an outer court was reached. Then a second opening led to a colonnaded court adorned with statues, sphinxes and other sculpture. A hypostyle hall followed, the outer wall of which probably displayed reliefs. Behind it were various chambers and beneath was a crypt. At the rear were steps leading to the sacred lake. The temple is not of one period. It is supposed to have occupied the attention of the PHARAOHS for at least two thousand years.

* *The Temple of Mut in Asher.* An account of the excavation of the Temple and of the religious representations and objects found therein, as illustrating the history of Egypt and the main religious ideas of the Egyptians. By Margaret Benson and Jane Gourlay. The Inscriptions and Translations by Percy E. Newberry. With Plans and Illustrations. (London: John Murray.)

But what gives appropriateness to the direction of the exploration is the fact of the dedication to a goddess, MUT, the Mother of Tears. As in other temples there were, however, statues and various objects which belonged to the cult of different deities. Lion-headed statues especially were supposed to be entitled to positions within the temple. It is conjectured they were not mere offerings for the benefit of the donors. MUT herself was believed to have a periodical necessity to use one of them as a refuge. The gods were not exempt from the universal law of dissolution. Each had his or her Ka, that is, a double or ghost, which could apparently be in a stone figure, but the figure must have a shelter. Plenty of figures were provided for a deity to whom women at least were devoted. It is not everywhere signs of human pity for a goddess are to be discovered in Egypt, and therefore the claim on the Temple of Mut in Asher is enough to increase our insular pride. The cry could be raised in the ancient world, "PAN is dead!" But as long as there were four or five hundred statues of hard stone standing in her temple nobody could exclaim that MUT had expired. As the authors say, "The piety of AMENHETEP III. and SHESHANG preserved in a sense the immortality of the goddess of whom they were votaries." It is also suggested that MUT was not without influence on the ritual of Israel. The subject is risky, but the authors are not afraid to say:—"It is tempting to think that the wings of MAAT, goddess of justice, are borrowed from MUT. Thus the cherubim of the Mercy Seat would spread wings of protection; but although the wings have the proportion of the vulture wings (the bird was a feminine symbol), it would be rash to say they are characteristically the wings of MUT." Soaring was familiar to the Hebrew mind, and therefore wings, which were also suggestive of the protection of affectionate strength for weaklings. It was therefore natural that outspread wings should occur to an artist as a symbol of protection without being derived from Egypt. Art, like law, may have "slowly widened out from precedent to precedent," but it is not wise to conclude that imagination was entirely inactive while the evolutionary process was in progress.

Modern mortals who crave commissions will find more interest in HATSHEPSUT than in the more exalted MUT. The queen will henceforth appear to us with more charm than the embalmed heroine of THEOPHILE GAUTIER'S "La Momie." It is no wonder she was great, for she had the good sense to realise that an able architect must be no less competent to build up a nation. We are indebted to the lady explorers for recalling to us so much about SEN-MUT, who, according to the inscriptions, was "Chief architect upon all the works of the Queen," and whose statue is to be seen in the Berlin Museum. He was of humble origin, but he rose to be keeper of the temple and granaries, guardian of the sacred cattle, the greatest of the great, the noblest of the noble, the leader of the guides of the gods, the chief of the secrets, and, in fact, he appears to have held every office worth having except the king's. Like the queen, the authors of the book are glad to testify to his worth:—

> So stands Sen-Mut, a man of colossal talents. To an age of specialists, when the quasi-critic intuitively decides that a man of two thousand years ago, and of the most talented race in the world, cannot be at once the visionary mystic of the Revelation and the meditative mystic of the fourth Gospel, the idea of such many-sided talent is inconceivable. Our great men may be eminent in a profession and a hobby. "Le peintre Rubens s'amuse d'être ambassadeur." In the Middle Ages our priests indeed were our statesmen, and Italy had a man who was at once a great architect, a great sculptor, a great painter and a poet. But this fades into nothing by the side of a man who was a great prince, the chancellor, a priest, a superintendent of priests, an architect and the clerk of works; and was, moreover, tutor to the queen's daughter.

We have said enough, we hope, to suggest the interest of the volume and of the excavations it describes. The Temple of MUT was affected by the changes in Egyptian history, as will appear from the pages. The nephew of HATSHEPSUT when he came to the throne was at great pains to remove all trace of the existence of that queen, and to attain his end perpetrated many acts of vandalism. We are afraid the temple suffered occasionally at the hands of

despots, but there were others to make amends. Its history is therefore a history of Egypt in miniature, and the volume by the lady explorers thus becomes a more efficient guide to Egyptology than many formal treatises. The insight of the authors is preferable to the pedantry which weighs so heavily on students, and the knowledge gained will well repay the time devoted to a careful study of the pages.

SYSTEMS OF DISTRIBUTING AND GENERATING ELECTRICITY.

By F. J. WARDEN-STEVENS.

(*Continued from page* 46.)

Continuous Current.

NOW with the continuous current system the current in the circuit is constantly in one direction. The advantages of this system are that it can be used directly for charging accumulators, which afford a most valuable stand-by in case of breakdown of machinery or sudden increase of demand, and all or at least a portion of the running machinery may be stopped and the supply left entirely to the accumulators during periods of small demand. This conduces to economical working and reduces the attention required in the works.

Continuous current motors are more easily started and more reliable in working at present than those constructed for use on an alternating current system. This is of great importance in districts where a large demand for motive power is probable.

It is not necessary to use a dangerously high pressure in any portion of the system, although in some works pressures of 1,000 volts and upwards are employed; still, as the use of these pressures is confined to the feeding cables, and is in no case continued into consumers' premises, there is no danger to the public by their use.

Meters and measuring instruments used with the continuous current system are in general simple, accurate and inexpensive; arc lamps are more efficient and reliable, and, generally speaking, every form of apparatus for using electricity is as economical with continuous current as with alternating, and in most cases the economy is better.

The great disadvantage of the continuous current is its inflexibility. Only one, or at most two, pressures can be supplied from one works, and the pressures cannot be altered without running machinery known as rotary transformers. It is often inconvenient and uneconomical to be compelled to use the current at the same pressure for all purposes, and for this reason the alternating current system is to be preferred in such cases.

Alternating Current.—In the alternating system the current passes through a cycle of changes, reversing several times per second. These alternations may be likened to the motion of a pendulum as it swings first in one direction and then in the other, with the exception that in practice the pulsations, and therefore the effects given out, vary so rapidly that they are not perceptible, and there is no visible fluctuation in the light produced by a lamp when the periodicity or number of alternations is from 50 to 100 per second.

These rapid pulsations make it possible to use what is known as a static transformer—that is, one without moving parts, which will alter the ratio of current and pressure to any extent required, but keeping the product of the two the same.

The great disadvantage attributed to the alternating system is that the machinery must always be kept running, as storage is not directly possible; this means that the staff for attendance must be larger and the coal consumption heavier than with the continuous system.

Accumulators are, however, now being used in the following way in connection with alternating current systems to reduce these costs. An alternating current motor is coupled to and drives a continuous current generator which is used to charge the accumulators. In the daytime and times of small demand the continuous machine runs as a motor from the accumulators, and drives the alternator, thus supplying any demand that there may be. This arrangement has been adopted at several electricity supply works with great success.

It may be taken that the chief advantage of the alternating system is its flexibility. The pressure can be changed as desired with little loss in economy and no moving machinery, but it is not easily and economically stored, and it has not the advantages mentioned previously in connection with the continuous system.

What is known as Rectified current is sometimes used for arc lighting where the alternating system is in use for ordinary purposes. A rectified current is a continuous current in so far as it does not reverse, but it pulsates in a regular manner. The current rises and falls in strength, from nothing to its maximum, periodically. The advantage of this is that it is easily obtained from the alternating current by means of a machine known as a rectifier, and is as efficient as the continuous current for arc-lighting purposes.

The pressure at which electricity is generated or used is not solely dependent upon the question of continuous or alternating current, although it is often assumed that the low-pressure is the continuous system and the high-pressure the alternating system.

The continuous system is generally adopted when the current may be generated at a pressure which will not necessitate being transformed before being supplied. The reason is that if the pressure need not be changed, the continuous system has all the advantages and the alternating system the disadvantages. There are, however, several cases of the high-pressure continuous current systems in operation with good results.

The continuous high-pressure system was first introduced at Oxford in 1892, and is to some extent a compromise between alternating high pressure and continuous low-pressure, inasmuch as it involves the use of pressures up to and exceeding 1,000 volts. The high-pressure continuous current is taken from the works by means of feeders to the various sub-stations in the district, which are either underground chambers built beneath the roadway, or the basement of houses if they can be secured for the purpose. These sub-stations contain rotary transformers or motor generators for converting the small high-pressure current into low-pressure current, the motor generators feeding into a network of low pressure mains. The economy of the system is considerably increased by the addition of accumulators in the works in conjunction with a rotary transformer, which can be employed for converting low-pressure into high-pressure current, or the accumulators can be in the sub-stations feeding direct into the low-pressure mains; it is then possible to stop the main generators during periods of small demand and supply from the accumulators.

One of the greatest advantages of the system is that it permits of the use of continuous current motors, which, as before mentioned, for ease of starting and reliability in working are still better than those obtainable for use on the alternating system.

High-pressure continuous systems are also in use at Shoreditch, Wolverhampton, Chelsea, Walsall and other places with successful results.

The Uses of the Various Systems.—The question as to the system of electricity supply adopted in a particular district is of the greatest importance, and among the considerations which decide it may be mentioned:—

1. Position of available site for the works.
2. Area to be supplied.
3. Character of the district, for example, whether the demand is compact or scattered, and whether motive-power is required.

The site for the works is or should be decided with a view to obtaining water-power or cheap coal, inexpensive land, a free water-supply, if possible, for condensing plant, good foundations and a position where legal action for smoke and vibration nuisance will not be likely. The further away the site from the area of supply the greater is the cost of feeders, and the greater will be the probability that high-pressure will have to be adopted, whereas it might otherwise not have been necessary. A saving of 100*l.* per annum in working expenses will be justified even if so much as 2,000*l.* capital has to be spent in obtaining it.

High-pressure is now seldom used if low-pressure is

financially possible, and as a rule, for reasons previously mentioned, the continuous current system is generally to be preferred to alternating. The usual pressure at which current is supplied is about 100 volts, but in order to save copper in the mains the pressure is now often 220 volts at the lamps. With the alternating system there is no great object in fixing a high-pressure of supply, as the distributors may be supplied at as many points as desired, shortening the length and reducing the loss of pressure. In fact, owing to the great advantages to be obtained by the use of low-pressure lamps in economy, first cost and appearance, 100 volts is the usual pressure with an alternating system.

There is no doubt that the continuous system two-wire is the simplest and most economical to work, and gives the greatest convenience to users as a whole, but the question of capital outlay intervenes. When this occurs it is probable that the adoption of the three-wire system relieves the situation, by reducing the cost of mains to about one-third for an equal amount of power. If the capital outlay is then still too high on the distributors, high-pressure distributors must be considered, and in that case the continuous system is abandoned.

It has been previously explained that the feeders may be high-pressure and the distributors low-pressure, if the site is far from the centre of the area of supply.

In considering the question of high-pressure supply, it depends entirely upon the character of the district as to whether transformers are placed at the feeding points and supply a low pressure distributing network, thus providing large and infrequent sub-stations, or high-pressure distributors are provided with transformers in the houses, or high-pressure distributors are used with frequent transformers supplying low-pressure mains from which the supply is obtained.

In a district where the site of the generating works is not central, or if there are thickly populated yet isolated centres of demand, with comparatively no demand to be supplied between them, then undoubtedly the transformers are placed in sub-stations at the feeding points. This is perhaps the only case where the continuous system is used at a high pressure, as only a small number of large sub-stations are needed, and so the attendance required for the transforming apparatus which for the continuous system must be moving machinery is not prohibitive.

High-pressure distributing mains and house transformers are not usually adopted now except for very scattered districts, as it is often only by employing this system that some districts can be supplied at all. All the cables being high-pressure, and consequently small and inexpensive, a large area and few consumers can be supplied without any considerable outlay. This inevitably develops in course of time into the street-box system, which is carried out as follows :—Small low-pressure distributors are laid all over the area, and at frequent intervals an iron case is sunk in the ground, in which a transformer is placed. At the same time a high-pressure network is laid connecting all these transformers together, and this is supplied by the feeders. When at any time consumers are connected to the mains and in such numbers that the loss of pressure on the low-pressure distributors becomes serious, a new case containing a transformer is placed near the congested part, and the distributor being supplied at another point is relieved, and therefore the drop of pressure is reduced.

This system is excellent in residential districts where houses are near together, but where the demand may be apart for some time.

In both these systems alternating current transformers are used because they contain no moving parts, and the great number of points at which the transformers are placed is no disadvantage, as they do not require attention.

With the alternating system the dynamos generate the current at about 2,000 volts, which is transformed into a current nearly twenty times as large at 100 volts for supply.

It will be seen that the question of distribution of electricity is an exceedingly complicated one, but it is to be hoped that sufficient has been stated to enable it to be understood to some extent, at least, that one system is not the best for every case, and that it requires considerable care to decide the best system for any district. The system decided on should also be applicable for extensions to any outlying parts of a district in the future without any serious alteration. It may be mentioned that this fact is apparently lost sight of in many cases where low-pressure continuous systems are adopted in a restricted portion of the area. It will probably be found that when the mains have to be extended considerable changes will in some cases have to be made in the system, costing perhaps thousands of pounds, which would not have been needed had extensions been considered at first.

EXHIBITION OF LITHOGRAPHS: FOREIGN.

IT is fortunate for the reputation of the English lithographers that the gallery at South Kensington does not allow of a comprehensive comparison of their works with those of Frenchmen. It is not possible to obtain a point of view from which more than a few of the plates produced in London and Paris are visible. The lithographs are hung on frames like clothes in a laundry, and the intervening passages are narrow. On account of the arrangement the inferiority of English work becomes less striking, and most visitors will never take the trouble of comparing it with the French, or indeed with any foreign examples.

Many years ago THACKERAY, who was a great admirer of lithography, because it was "the honest work of hand," explained why the art was in a more satisfactory condition abroad than among his countrymen. As draughtsmen, he considered the French and Germans were superior; then as the foreigners were not rich they could not pay for costly engravings like those produced in England. They were compelled to be satisfied with military scenes dashed off on stone by RAFFET, CHARLET, VERNET, or "clever pictures from the crayon of the DEVÉRIAS, the admirable ROQUEPLAN or DECAMPS." They get, he says, "the *loisirs* of men of genius, not the finikin performances of laboured mediocrity, as with us; all these artists are good painters as well as good designers; a design from them is worth a whole gross of Books of Beauty." There was a further reason—the admiration of the French for caricatures, which lithography might have been invented to serve. It is not yet extinct in Paris, and some of the daily journals have to provide caricatures two or three times in a week. At one time it was expected that a new example would appear nearly every day in the print shops. To supply the demand many artists attempted to produce humorous subjects, and it is needless to say success did not always attend their efforts, but their courage was marvellous. PHILIPON, when brought before the law courts for the notorious portrait of LOUIS PHILIPPE as a pear, went through the process of evolution by which a pear became the king's countenance, for the amusement of judges and jurymen, and in that way gained an acquittal. It was necessary to pass a law by which caricaturists were obliged to keep their pencils and chalks from representing royalty and the Government. The only effect was to oblige the artists to give more attention to social subjects, and in an indirect way to display the effects of the incompetence of the authorities.

Lithography was introduced in Paris as soon as SENEFELDER secured his patent—that was in 1802. There is a small lithograph by the veteran EUGÈNE LAMI, dated 1810, but the art was not turned to much account until the close of the Empire. Then the political transformation gave scope for satirical prints and for battle scenes which had a similar purpose. By HORACE VERNET there are plates which begin with 1815, and they show the skill which in his case was hereditary. In his lithographs we see indications of the facile power which subsequently enabled him to produce such a multitude of paintings of warlike and scriptural subjects. The work by his father, CARLE VERNET, is similar in style and subjects, but reveals more patience. There is a curious series, mostly landscapes, "the joint work of Prince LOUIS NAPOLEON, Grand Duke of Berg and Cleves, and of the Princess CHARLOTTE BONAPARTE," which is up to the usual amateur standard.

GERICAULT'S name will always be associated with the sombre *Raft of the Medusa*. But if he had lived he must have gained more fame as an animal painter. He was one of the earliest revolutionists against the stilted school of DAVID, and his ideal was to be found in nature instead of in sculpture. Most of the lithographs by him which we

find at South Kensington were published in London, which he visited in order that he might be able to study English horses. It may not be generally known that the first encouragement he received was in this country, for his innovations were not appreciated in France. He drew about a hundred plates on stone. There are only eight at South Kensington, but they are of much interest. In those with horses—such as the English Farmer, Racehorse and Jockey, Watering Horses, &c.—we can see a master's hand. There are several by JACQUES DEVÉRIA, consisting of portraits and figure-pieces. They are capital specimens, but the artist was best with costume pieces, and at one time he was expected to hold a place in painting similar to ALEXANDER DUMAS'S and VICTOR HUGO'S in romance.

To have gathered fifty of CHARLET'S plates is a success for the organisers of the exhibition. It is possible, however, they will not be appreciated as they merit. The artist was a worshipper of the army, like many of his countrymen at the present day, and he was no less inimical to all the organisations which civilians directed—diplomacy, law, education, finance, religion. He was the son of a dragoon, and his early ambition was to be a soldier. But LOUIS XVIII. cared only for peace, and CHARLET became a drawing master. A shrewd publisher utilised him to draw figures of the old soldiers of the Empire on stone, and by degrees he became one of the representatives of militarism. He painted an occasional picture, but the works by which his name will live are his lithographs. The great painter, EUGÈNE DELACROIX, with all his misanthropy, was proud to be the eulogist of the designer of plates which were supposed to serve only the most brief interest of the passing hour. He declared that CHARLET had the power of imagination and execution which belonged to the grand artists alone. He pointed out the impossibility of discovering two of CHARLET'S heads which were alike, that in his drawings the grand was united with the natural, and as success was gained the artist endeavoured to become more and more careful in composition and finish. DELACROIX would place CHARLET alongside MOLIÈRE and LA FONTAINE as a describer of characters, and yet many of his finest plates could not attract purchasers. His twelve plates of the ancient French Army were so neglected, the artist rubbed the drawings off the stone, and several others were likewise destroyed. In conclusion, DELACROIX declared he was unable to do justice to the genius of CHARLET. It is well to remember the criticism of the painter, for so many drawings of old soldiers may appear commonplace things to a stranger. The veterans are always genial and childlike, occasionally given to grumbling, but models of obedience to their officers.

RAFFET was a pupil of CHARLET, and his manner can be traced in some of the plates which bear the master's name. He also was devoted to armed men. RAFFET'S plates are more admired outside of France. He possessed marvellous skill in composition. The two plates of *The Midnight Review*, and *The Flight of Arabs from Constantine*, *The Combat of Oued-Alleg*, &c., would have been beyond attainment by CHARLET'S skill. RAFFET was always successful with a crowd, while CHARLET'S most characteristic plates have only two figures—one suggests the individuals, the other the battalions. RAFFET did not confine his attention to the trials and triumphs of French soldiers. He was invited to Russia, and made a roundabout journey through the East of Europe and Turkey. Soldiers of various nationalities were treated by him with uniform interest, and in that way he set an example which M. DETAILLE has followed. In our days, when photography has revealed the manners of all the peoples of the world to the stay-at-home travellers, and when excursions are arranged to remote regions, RAFFET'S Tartars, Tsiganes, Moldavians, Cossacks, Armenians, &c., will not be novel, but it should be remembered they were published nearly sixty years ago, and then they surprised the Parisians.

Among the examples by DECAMPS only one or two suggest that he also was a political caricaturist whose strokes left wounds which time could not always heal. He was considered worthy to co-operate with CHARLET and GRANDVILLE. The plates which expressed indignation against rulers were inspired only by a factitious spirit; the true DECAMPS is not apparent in them. Although a Parisian, he was possessed by the poetry of landscape, and his works are comparable with those of DIAZ and COROT. Eastern landscapes especially captivated him, and he drew figures which could be worthily introduced in them with the accuracy of FROMENTIN or GERÔME. DECAMPS'S plates have therefore an unique interest. Many are studies which were intended for pictures, others are complete compositions which surprise us by the variety which is produced with black chalk alone. For Englishmen his lithographs should have peculiar interest, for it is believed in France that DECAMPS'S mode of treatment was derived from J. S. COTMAN'S etchings.

FRANÇAIS reproduced several of DECAMPS'S drawings, and his plates after COROT, TROYON, ROUSSEAU and other artists are no less expressive. But his own compositions are the most charming. There was no artist during the century who contrived with so much judgment to make amends for the absence of colour in lithographed landscapes. It is to be regretted that more of his original work is not visible at South Kensington. We have marvellous translations, but those who are acquainted with what he has done will agree that his ability is more displayed in the subjects he designed on stone or those which are copies of his own pictures. M. FRANÇAIS was fascinated by the mists which are so often seen in France floating over plains near rivers, and one of the attractions which he found in lithography was, we suppose, the facility which it gave for rendering phenomena of the kind.

There are many other artists whose works merit a lengthened notice. The elder GRÉVEDON, for instance, is represented by a dozen plates, but they are the memorial of a most remarkable career. He was born in 1776, the son of the "officier des gobelets du roi," an officer which recalls the hereditary bootjack of whom we read in "Esmond." As such he had the run of all the studios in the Louvre, and his toys were paints and pencils. As a matter of course he entered the Académie, and in 1789 he carried off a first medal. When the Académie was suppressed by the National Convention he joined the atelier of REGNAULT, and one of his fellow-students, who was more remarkable for talkativeness than drawing, was CASIMIR PÉRIER, the grandfather of the ex-president of the third republic. In 1804 GRÉVEDON exhibited in the Salon a painting entitled *Achilles Landing on the Shore of Troy*. It gained a first-class medal, and NAPOLEON ordered that the artist should be informed of the Imperial satisfaction with the work. The reason for such extraordinary success was that France as well as the emperor interpreted the work as meaning *Landing of Napoleon the First in England*. But the excitement was too great to endure. GRÉVEDON was neglected, and went to Russia in search of patronage. Then he tried Sweden, and afterwards he found his way to London, where he lived six prosperous years, or from 1813 to 1819. On his return to Paris he was, like ISABEY, BONINGTON, MICHALON and many other painters, absorbed by lithography. His portraits were so successful, the publishers were able to pay him 20*l.* for a head, which was then a large price. For twenty-three years he devoted himself exclusively to the art. After 1846 he resumed his work as a painter, and up to 1860, the year of his death, he produced works which showed no signs of failing powers. In his imaginary figures we can see the influence of his age, but his portraits are among the most vigorous in the French collection.

CÉLESTIN NANTEUIL has been called "the COURBET of lithography," and although the plates by him which are exhibited are of small size, they suggest the appropriateness of the appellation. As a painter he utilised colour to add illusions to scenes which might be suggested by dreams, and by his crayon he often produced subjects that were no less removed from common life. LASALLE'S lithographs are too often considered to be mere subjects for imitation by young artists. His *Napoleon* is almost as effective as the original by DELACROIX, and his *Medea*, after DELACROIX, is an undoubted masterpiece, in which, by the treatment of light and shade, the tragic character of the picture is more than suggested. M. ACHILLE SIROUY, who is foremost among the living lithographers who reproduce pictures, is known by plates which will bear comparison with LASALLE'S for draughtsmanship, while he has a versatility that is his own. He can render works by PROUDHON, MEISSONIER, ROSA BONHEUR, TROYON,

SIGALON which will express the style of the originals. For anyone who wished to establish an art gallery on a small scale in a parish or village a collection of M. SIROUY's plates would be almost sufficient to start with.

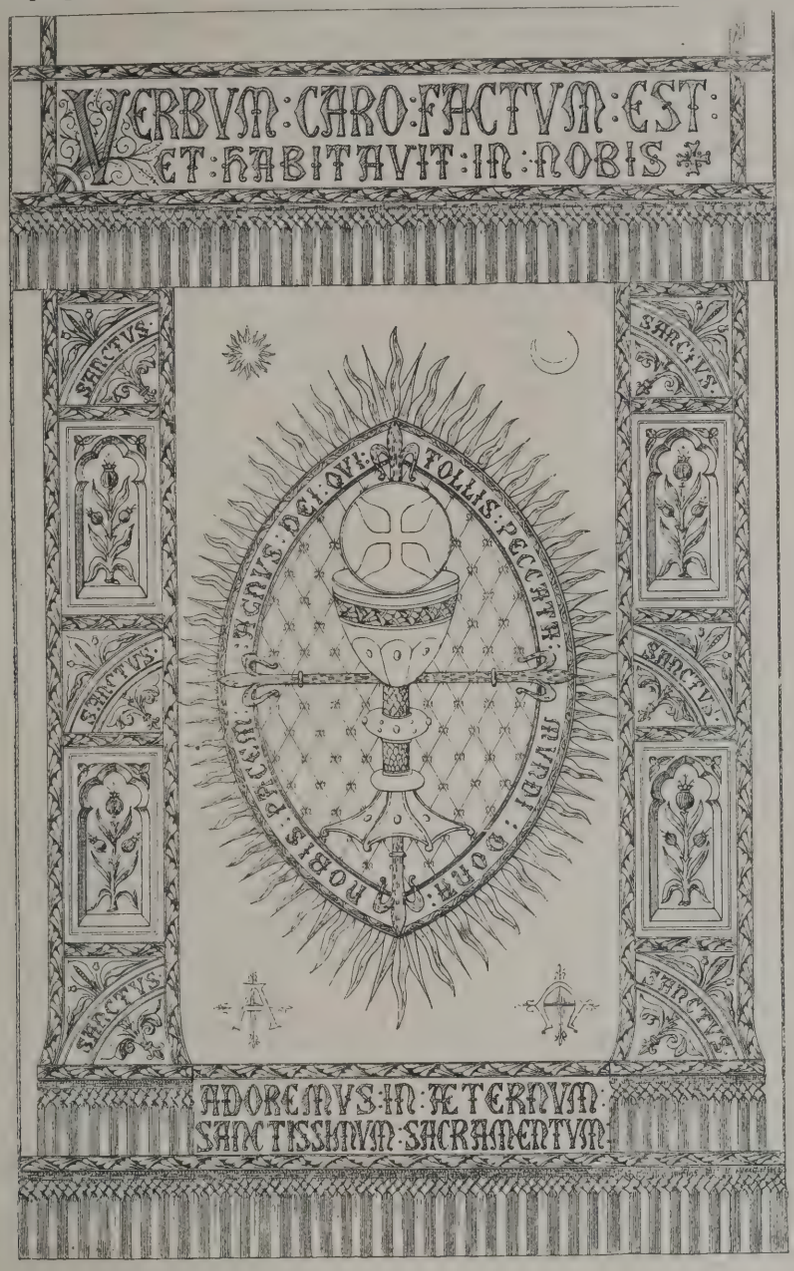
Artists like DECAMPS, FRANÇAIS, LASALLE and SIROUY have considered that a plate which is worthy of the name cannot be produced except slowly by a gradual working out of effects. They know that flatness can only be overcome in that way. There is little or no relief obtainable in etching or line engraving, and to obtain black of a desirable depth, and which will not appear a patch, is no easy task. Some artists consider it is no use struggling against the impossible in lithography. They prefer to treat it as an art which is lyrical in character, and is most suited to express the feelings or thoughts which are suddenly aroused and as suddenly vanish. HONORÉ DAUMIER, who is well represented in the exhibition, is therefore considered to have realised the limitation of the process. He boldly drew the figures he wished to satirise, and if needful made the heads out of proportion to the bodies. He possessed invention, and his subjects are often humorous. His most successful hits now need an interpreter, for even his prominent politicians are now forgotten. GAVARNI also did not care much about elaborating his designs, unless in those which were specially prepared for the English market. But with all their slightness they are likely to live, for they will be accepted as representing types of Paris life who are supposed to be engaged in playing parts in ridiculous farces.

The new school does not neglect the species which yielded so much to GAVARNI and the other caricaturists, but they like to suggest the tragic side of the incidents. It is easy to imagine, for example, the kind of portrait which GAVARNI or DAUMIER would make of PAUL VERLAINE, the poet. He would become an absurdity at which all decent folks were expected to laugh. He would be more hideous than "THOMAS VIRELOQUE," which was one of GAVARNI's creations. But the poet is drawn by M. EUGÈNE CARRIERE with an earnestness that appals. Hunger, disease, drunkenness, insomnia, are all shown to have left their mark on the poet's face; his unrestrained imagination appears to have distorted his forehead, the conflict between his conviction of his greatness and the contempt in which the world held him make him appear as if he were doubtful of his humanity, and believed like Poor TOM that five fiends were in him at once. It is an unforgettable portrait, for which lithography seems the most fitting medium, as we cannot suppose so scared a being could be induced to go through a succession of sittings. A work so expressive was necessarily laborious, but the toil is concealed. In looking at it one is not merely moved to pity for the subject, but the question obtrudes whether FRANÇOIS VILLON did not bear more resemblance to the lithograph than to the smiling statue we see at the Rue Monge?

VERLAINE was not one of the pillars of the vanished cabaret known as the "Chat Noir," but several men of genius were in that position. It seems odd that so strange a place was needed to make Parisians acquainted with a dramatist like MAURICE DONNAY and artists like HENRI RIVIÈRE, ADOLPHE WILLETTE, CARON D'ACHE and FORAIN. RIVIÈRE is one of the forces in the new lithography. Several of his countrymen have endeavoured to demonstrate that landscapes can be subjected to laws of decoration; he has established the fact. In the transparencies of the "Chat Noir" he used to amaze the frequenters by the extreme simplicity of his pictorial elements. He put, as it were, a few suggestions before them, their imaginations created the pictures. They were delighted at their own cleverness, with which they credited the artist. M. RIVIÈRE has now adopted chromo-lithography, the least valued branch of the art, as a means for his necromancy. He is bringing out plates in series which will be excellent aids to decoration. But in his colour pictures there is no need for the forty or fifty paintings which are commonly supposed to be indispensable if a landscape is to look like nature. Every coloured bit used by M. RIVIÈRE is as flat as if it were a geometrical pattern. There is no superimposing or shading. Coloured papers pasted together might produce a similar result. But there is no doubt the general effect is successful and is more decorative than efforts produced at a far higher cost.

M. WILLETTE is another adept in husbanding resources so that a little may go a long way. In the article on CHARLET which DELACROIX wrote praise was lavished on a lithograph which was a scene in the Russian campaign. But it is not so impressive as the *Funérailles*, which is to be seen at South Kensington. The few soldiers and the melancholy dog that follow NAPOLEON over the snow appear as if going to the burial of the Empire, and the most wondrous creation which time saw passes off the surface of the earth like a pauper, who can only count on a share of the common fosse.

M. FANTIN-LATOUR's lithographs do not recall his flower paintings or his portraits. They suggest the difficulty which arises when one artist copies the works of another. If published with a different name on them the plates would be declared to be wanting in M. FANTIN-LATOUR's characteristics. But he does well when he realises that drawing on stone is different to painting on canvas. The shortcomings of the stone are turned to account. In some of the lithographs the figures appear as if seen through a mist, and in the scenes from the operas of WAGNER and BERLIOZ that is not a disadvantage. Germans would prefer more muscular figures for the Nibelungen, such as Germans alone can draw. M. FANTIN-LATOUR's figures have nothing extreme about them. He evidently considers it is not necessary to be restricted to outlines. His contrasts between light and dark are pronounced, but they appear to be accomplished by delicate touches. Scraping is employed for lights, and altogether there is an absence of that expression of mechanical toil which is apparent in so many lithographs. M. FANTIN-LATOUR's plates are among those which must be considered by all who care to understand the tendencies of modern lithography.



The delicacy which many Frenchmen employ and which is a proof of dexterity would, we suppose, be considered illogical by the countrymen of SENEFELDER. Their drawings suggest they consider that stone from its rigidity demands thoroughness and solidity in all work executed upon it. The most interesting plates in the German section are the copies of pictures in the Munich and Dresden Galleries. The lithographers made no efforts to suggest they could have styles of their own, and the impersonality is not without advantages. There is nothing to be acquired from the German lithographs nor from those of Spain and Italy. The Dutch examples, if few, are interesting, and from the studies of Messrs. WHISTLER, ABBEY, PENNELL, SARGENT, the American section gains importance. But the Frenchmen alone appear to have possession of the future of lithography, and it is their drawings which must be studied by all who would emancipate themselves from old-fashioned notions about the province of the art.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT a meeting of this Association, held in the Royal Institution, Edinburgh, on the 11th inst.—Mr. Robert Ross, the president, in the chair—a lecture on "Explorations in Palestine and Jerusalem" was delivered by Mr. A. C. Dickie, of the Dundee Institute of Architecture. The paper dealt with the recent excavation at Jerusalem carried out by the Palestine Exploration Fund, under the direction of Dr. Bliss and Mr. Dickie. Their principal work was the recovery of the southern limits of ancient Jerusalem, and the recent explorations showed, he said, that the city once extended very much further south than the present southern boundary, the addition and the area of the city amounting to over 100 acres. Almost the whole of this area is now cultivated in tiny terraces and plots, the soil having accumulated over the ancient ruins to an average depth of from 25 to 30 feet, and in some places as much as 70 feet. The ancient wall encloses the whole of the western hill down to the verge of the Kedron valley across the Tyropeon, under the Pool of Siloam, on to Ophel, where it joins the wall traced by Sir Charles Warren from the south-east angle of the Temple area. Towers occur at short intervals along the wall, and three gates (two of which show three periods) were found between the Protestant cemetery and the Pool of Siloam. The discoveries illustrated in a remarkable manner the description given in the second and third chapters of Nehemiah of his night ride and survey of the ruined walls, and subsequent apportionment of sections of the work of restoration to the different Jewish families from the "Valley Gate" to the "stairs that go down from the city of David" (chap. iii. 13-15).

CHURCH BANNER.

THE banner, of which we give an illustration, is for one of the wards of the Confraternity of the Blessed Sacrament, a Church of England society founded in the year 1862, and now numbering some 30,000 members, banded together for the purpose of united intercessory prayer. The design is by Mr. HUGH ROUMIEU GOUGH, architect, one of the oldest members of the Society, and the whole of the embroidery has been admirably carried out by Mrs. LOANE, of Ravenscourt Park, W., assisted by other members of the Confraternity.

RUSKIN SOCIETY OF GLASGOW.

THE first meeting of the second part of the session of this Society was held on the 9th inst. in the Society's rooms, 100 West Regent Street, when Mr. Paton, curator of the Corporation Galleries, lectured. The president (Mr. James Borland) introduced the lecturer. Mr. Paton, whose subject was "The Beginnings of Christian Art," first drew attention to the decadence of art in progress at the beginning of the Christian era. He then noticed the prohibition of the use of images in Hebraic worship and the horror of idolatry among the Jewish race. That horror was inherited by Jesus and His followers, and the Apostle Paul, as well as all the early Fathers of the Church, insisted most strongly on the perils of images in the Church. Notwithstanding these teachings and warnings, the art traditions and instincts of the people led them gradually to disregard their warnings. It was in the catacombs of Rome, the earliest burying-ground of Christians, that the first developments of Christian art were to be studied. The nature of the catacomb pictures, their mixture of pagan and Christian motives and symbols, were next dealt with and illustrated. It was shown that the decline of art was not arrested by the spirit of Christianity, and while the painters changed their faith, their art continued the same. The enormous influence of the adoption of Christianity by the Emperor Constantine and of his transference of the capital from Rome to Constantinople were discussed, and the progress of art in the fifth and sixth centuries was illustrated by the mosaics of that era still extant in Rome and Ravenna. Finally, the great iconoclastic war, with its causes and vast consequences, was briefly sketched, and the lecture was concluded with some observations on the relations of art to Christian progress generally. Mr. Paton's observations were illustrated by a series of lantern slides. Mrs. Nelson, in a few remarks, proposed a vote of thanks to the lecturer at the close.

BRISTOL SOCIETY OF ARCHITECTS.

AT the ordinary monthly meeting held at the Fine Arts Academy on the 16th inst., the award was made in the students' competition for measured drawings prizes, the first prize of six guineas going to Mr. C. F. W. Dening, articled to Mr. H. Dare Bryan, the second and third prizes being equally divided by Mr. H. F. Smith, articled to Messrs. Crisp & Oatley, and Mr. E. G. Rodway, articled to Mr. H. Dare Bryan. The subjects drawn were of local and historic interest, and included Kewstoke Church and Cleeve Abbey, Somerset; the cupola of All Saints Church, city; the Mede Tomb in St. Mary Redcliffe, and the interesting little Georgian church on Redland Green. After the general business of the Society had been transacted a paper of much literary and artistic interest on "Rhythm in Design" was read by Mr. F. Bligh Bond, a cordial vote of thanks to whom terminated the meeting.

NOTES AND COMMENTS.

WHEN the county surveyorships in Ireland were thrown open to competition it was found that a higher class of engineers than used to have possession of the appointments sought for them. Englishman and Scotsman who would appear to be competent for more lucrative positions were willing to settle in districts where there was not much scope for an ambitious engineer. The Government are not oblivious of the improvement, and this is seen by the selection of Mr. COWAN, the surveyor for the southern part of the county Mayo, for the chief engineering inspectorship of the Local Government Board, an office long held by Mr. COTTON, who was an assistant to the late W. R. LEFANU, C.E., the author of a most amusing collection of Irish stories. Mr. COWAN's experience is varied enough to enable him to deal with any question that is likely to arise. A native of Dundee, he gained in 1878 a Baxter scholarship. Then he studied in the engineering classes in Edinburgh University, and for a time served as assistant professor. He won the coveted Dunlop scholarship, which is worth 300*l*. After holding appointments in America he tried for an Irish county surveyorship, and was successful. An inspector who is so qualified and energetic can render many a service to his adopted country in the Local Government office, which is now beginning a new era.

A COMPETITION which is certain to attract many designs is that for a chapel and other cemetery buildings arranged by the Urban District Council of Knutsford. The conditions are most unsatisfactory, and in such cases architects become like gamblers who play heavily when the chances are against them. The game has then a novel fascination. There is not a word in the conditions about obtaining the advice of even a local builder. The Council reserves to themselves the right to exclude designs if the probable cost is supposed to exceed the contemplated outlay or be otherwise unsuitable. If all the designs are considered disappointing the Council do not propose to prepare their ideal design, they generously offer to arrange a second competition. They expect architects will be no less self-sacrificing. Whoever is the happy man that gains the favour of the Council will have to supply quantities at his own cost. The moderation of the demand is praiseworthy, for the successful competitor might have been asked to supply the school furniture, if not some of the building materials. Moreover, 5 per cent. on 4,000*l*. will be paid as commission. Such an opportunity does not occur every week, and the Urban District Council may be confident it will be appreciated beyond their anticipation.

IT is allowable, we presume, for Roman correspondents to startle the world with announcements of the discovery of the tomb of ROMULUS or the Niger Lapis which marked the spot where he was not buried. Imagination has had full scope in Roman archæology for many a century. Signor BACCELLI's explorations in the Forum Romanum are only in progress, and until they have been completed and investigated by men who are recognised as authorities in the science, it is premature to come to conclusions respecting them. It is time there was an end to the substitution of guessing for reasoning. Mr. ST. CLAIR BADDELAY's recommendations on the subject deserve to be remembered. He says :—"It may be of use to suggest that statements made concerning both the most important recent discoveries in the Forum should be accepted with considerable caution. The octagonal pedestal of the column erected to JULIUS CÆSAR, in the one case, is made of tufa concrete, a material not employed for such purposes until days very long after his date, while in the case of the so-called 'Tomb of ROMULUS,' in front of the 'Curia,' the material uncovered consists of quadrangular blocks of 'nero venato,' or marble, from Cape Tænarus, sufficiently irregular in size as to suggest work of the third century A.D. They have, it is true, suffered by exposure in ancient times, and still more by the superposition of still later pavement of 'selce' or lava blocks, but they can never have been precisely uniform in size. They measure on an average 60 centimetres by 75 centimetres, and are 19 centimetres to 25 centimetres in depth. That some object of great historic importance will be found beneath we may rest assured, but whether it will prove to be related to FAUSTULUS or to the story of Attus Navius and the Whetstone, none may yet say. As the whole of this portion of the Forum was swept by the fire of Carinus, the pavement probably dates at earliest from A.D. 260. It may originally have been square, it is now about 4 m. by 3 m. 7 cent. ; orientation, S.E.-N.W."

WE have no means of knowing whether the unsuccessful competitors for "The PHŒBE A. HEARST Architectural Plan" are less discontented than those architects who have had an earlier experience of failure, but they cannot say they are the victims of unbusiness-like arrangements. The designs, it will be remembered, were lodged in the Musée Royale des Beaux-Arts, in Antwerp. There they came into the hands of Belgian officials and employés. Photography has been employed to demonstrate to the competitors and others how the designs were kept concealed until the hour arrived when they were to be brought before the jury. The cases containing the drawings were covered with paper, securely tied and sealed with wax bearing an official stamp. It was impossible for anyone to see a drawing without breaking the seals. The door of the room containing them was also effectually sealed. The next stage was to prepare the drawings for inspection. A photograph shows that no less than thirty men and boys were employed to make stretchers and to mount the plans. Every indication of a motto or other clue to authorship was carefully concealed. The plans were then covered with paper, tied and sealed. There was no likelihood of prepossession in favour of any design, or of prejudice against it, when a design came before the jury. Each had to depend on the impression which was made when it was revealed. The order observed was favourable to arrival at a right judgment, for there was no confusion or liability to confound the designs of two competitors. The account by Mr. REINSTEIN, which is printed on another page, is borne out by the evidence of the photographs.

THE Exhibition of Art which was held by the members of the International Society of Sculptors, Painters, and Gravers, at Knightsbridge, during last summer, was too interesting to be without some record of its contents. The catalogue prepared by Messrs. CARL HENTSCHEL & Co. and published by Mr. HEINEMANN, contains illustrations of the principal pictures which are reproduced in satisfactory style. There are over one hundred plates by artists who are representatives of various sections in the modern realistic school. They have as much fidelity to the original paintings as is attainable without the help of colour. Some works appear more suitable for the photographic process than others, but all the plates are deserving of attention, and, we may add, of preservation, for hereafter they will be evidence of the condition of non-academic art in Europe in 1898.

THE Southampton Town Council have shown good sense in declining to approve of any scheme which would cause the removal or alteration of the old Bargate. The middle arch is not sufficiently high to allow of the setting up of overhead wires in connection with tramways, but the difficulty can be overcome by lowering the roadway. Some people have proposed that the Bargate should be made the centre of a circus. That would be an improvement, but the cost of acquiring the necessary property is likely to be an obstacle. At present lovers of antiquity can rejoice in the preservation of the ancient portal ; whether the effect of it is to be enhanced by street improvements is a question for the future. If outside opinion had not been brought to bear on the Council, the days of the Bargate would be few. The precedent is therefore important, and we hope it will not be without influence on authorities elsewhere.

X.

Bourges—Etampes.

OF the *instrumenta ecclesiastica* at Bourges, perhaps the most striking is the great corona lucis, suspended just at the point where the choir begins. Modelled on the celebrated one at Hildesheim, it must form, taken in conjunction with the smaller coronæ of less happy design hung all down the nave, a superb picture when lighted up on dark afternoons, or on the rare occasion of an evening service.

We once had the good fortune to be present in Amiens Cathedral during a late week-night service. It was July 29, and the festival of St. Martha, the patron saint of cooks, a large body of whom were present, and accommodated with chairs in the choir between the two rows of celebrated carved stalls. Anything more impressive in a continental church we do not remember than this service, the ritual being most magnificent, and carried out with the pomp for which Amiens has always been celebrated.

NOTRE-DAME, ETAMPES: SOUTH DOOR AND TRANSEPT.

The music was commensurate, and the manner in which one of the Psalms was sung to the fifth ending of the First Tone will long live in the memory, while the immense building, dimly lighted by a few candles placed at intervals amid the chairs in the nave, with the last rays of daylight struggling through the painted glass in the transeptal roses, the high altar and its surroundings being in a blaze of light, formed a scene which is not presented to the everyday traveller on the Continent.

At Bourges, as in the majority of French cathedrals, the high close screen is absent, its place being taken by a low modern Gothic grille of iron, delicately and beautifully wrought. This runs right across the church, including both aisles, and forms the only visible separation between nave and choir.

Modern French ecclesiologists seem to have no idea of the light open jubé of wood or brass with which our cathedrals of Ely, Hereford, Lichfield, Salisbury and Worcester have been equipped since the Gothic revival, nor of the suspended or elevated rood and attendant figures, modern examples of which have, with the approval of the clergy and to the delight of many a devout congregation, been placed of late years in many of our ancient and modern parish churches.

In France original jubés of stone or marble exist in the Madeleine at Troyes, Notre-Dame de l'Epine, near Châlons; Notre-Dame at Brou, the cathedral of Alby, St. Florentin near Auxerre, and in St. Etienne du Mont at Paris. A very poor pseudo-Gothic screen closes the choir of Amiens from the transepts; the choirs of Tours, Rheims, and St. Etienne, Caen, have tall iron grilles of questionable design; others of a better sort exist at Auxerre and Laon; the highly elaborated ones encircling the choir of St. Ouen, at Rouen, rivalling in richness Tijou's work in St. Paul's, must not be forgotten; while at Paris, Chartres, Coutances, Troyes, Bayeux, Lisieux and Sens, a low grille upon a dwarf wall, although it gives an uninterrupted view of the ritual being performed in choir is but a sorry substitute for the tall, light, open rood, which not only imparts an air of solemnity and mystery to the building, but performs the function of a milestone, by which we may, in imagination, measure the length of a church, and thus in the most legitimate manner make it appear longer.

The high altar at Bourges retains its pseudo-Classical form and ornaments, while, as usual in the French cathedrals, those

BOURGES: CRYPT OF THE CATHEDRAL.

in the radiating chapels have been restored in the Mediæval manner. The presence of a candle burning all by itself in a common crockery-ware candlestick, such as one sees on toilet tables, right in the centre of the carpet before one of these side altars, was not a little diverting. Verily extremes meet.

With regard to the treatment of the chapels in the outer processional aisle at Bourges, it is not improbable that they present us with the same arrangement that Notre-Dame at Paris must have done before its fringe of Early Middle Pointed chapels was projected at the close of the thirteenth century. Here the outer wall of the second aisle has three compartments for every one in the central apse, and from the centre division of each of these a small circular-ended chapel with a triplet of lancets is thrown out. The wall on either side the entrance to these chapels is pierced with a couplet of very broad lancets—one of the finest and most marked features of the early chevets, and one which occurs in that of Le Mans. When we go outside we see that each of these projecting chapels is

bracketed out oriel-wise above the crypt, which is visible externally, is of vast extent and of the most refined thirteenth-century work.

Several of the nave chapels have been Flamboyantised, but with these exceptions few cathedrals in France have remained so unaltered by late accretions and additions as the majestic edifice now under consideration.

It is not often that one visits a world-famed church without disappointment. That of Bourges not only equalled but much surpassed all previously-conceived ideas of it, while its situation at the summit of gently rising streets, whose picturesque houses give scale to its immensity, with the light freely admitted on all sides, and with the archiepiscopal gardens extending the whole length of its south side, is one enjoyed by few other great French churches.

The yellow sunlight of the July afternoon renders the gay parterre of bee-haunted flowers in the unshaded part of these gardens too dazzling to look upon, but it only trickles down in a golden shower through the encircling avenues of lime trees upon picturesque knots of smartly-coiffured bonnes, and upon a happy-looking group, occupied with books and work, gathered round a Sister of Charity, who occasionally hands round a bag of cakes.

Sunday at Bourges.

En dies est Dominica
Summo cultu dignissima ;
Ob octavam Dominicæ
Resurrectionis sacræ.

A still, hot, perfect morning. The cliff-like western façade of St. Etienne towering up against a sky guiltless of clouds. An awful stillness reigning throughout the vast interior, whose eastern portions are glorified by the newly-risen sun, while its western end is as yet cold and grey.

But these hallowed feelings are somewhat rudely dispelled, for on approaching one of the side chapels on the north side of the nave we find two small servers, supposed to be preparing its altar for an early Mass, indulging in a little private pantomime—hitting one another over the head with the elongated silver dish in which the cruets ordinarily repose, thrusting the taper with which the altar candles have just been lighted up each other's noses, playing Teggy Touchwood round the confessional box and so on—performances which, concluding with a mad race to the sacristy, the slamming of whose doors reverberates through the sacred building, are, to an English Churchman with an English Churchman's reverence for holy places and holy things, exceedingly improving and pleasant of course.

At half-past nine the Parochial Mass is performed *sine cantu* in the lady chapel ; outside it, in what they call in France the *Pourtour*, the congregation, a fairly large one, is disposed all over the floor in chairs, the *ensemble* being strikingly picturesque. Their elasticity, if we may use such a term in connection with these great French churches, constitutes one of their greatest charms. You go to the offices of Mass or Vespers and stand about as you please : you do not feel in anybody's way ; are not stared at ; you do not feel obliged to fix yourself in a seat at once for the whole service ; you may take a chair if you please, and where you please—nearer or further from the choir or altar as you like. Should you choose, you may attend the whole or part of the service without sitting down at all, and you fall into a far more easy and natural position than in our benched and closely chaired churches at home.

The Parish Mass concluded, everyone, thinking no doubt his or her duty done for the day, hurries off, a very scanty congregation assisting at the subsequent grandly rendered Chapter Mass at half-past ten.

While sauntering round the choir aisles listening to the solemn roll of the plain chant at Terce we encounter a very benevolent-looking old cathedral dignitary, M. le Chanoine Darrenguet, with whom we had enjoyed a lengthy conversation upon the architecture of the cathedral the day previous, and who had in the most polite manner conducted us round, pointing out its most interesting features, and drawing our attention to such as we should otherwise have overlooked, left to ourselves.

Thus it happens that on Sunday morning we are met with a courtly bow, and an invitation to take "un banc près le maître autel," which, however, we decline. For once at Fécamp we got so unpleasantly near the gentleman who performed on the ophicleide, or some analogous instrument, as to render a repetition of the experiment undesirable. We therefore elected to seat ourselves in the nave, whence a good view could be had of the various ceremonies attendant upon the performance of the highest Office of the day, which, neither ritually nor musically, could compare in point of splendour with that at Chartres.

Subsequently we contrived to visit the Maison Jacques Cœur, where we enjoyed a quiet and leisurely inspection of the numerous objects of antiquity that have been collected therein, and the church of St. Pierre-aux-Corps—one overlooked by Murray, but deserving of notice if only on account of the slope of its floor from east to west. To the architectural student this church presents several features of considerable interest, one of them being the discrepancy between the two nave arcades, referable to a fire which did much damage to the city in 1487. The south arcade of St. Pierre-aux-Corps is an excellent specimen of First Pointed work, with columns of the "compound" type—four slender shafts disposed around a core.

The northern arches belong to the Third Age, and spring from half-shafts attached to a square pier, as in the little church of St. Ethelburga, Bishopsgate. The apse of St. Pierre, with its five acutely-pointed arches, presents, owing to the curious ascent of the floor towards the east, a most imposing appearance from the west end of the church. It has, like the south side of the nave, a clerestory of small lancets, and is vaulted in the most fascinating style of the thirteenth century, recalling, on a small scale, the work in Notre-Dame, Dijon.

There are no transepts here, nor is there any visible separation between nave and choir. A square tower with low stunted spire stands at the west end. The former is open on three sides, beautiful pointed arches of Early Gothic character admitting north and south to a species of narthex, while above that leading into the nave is another arch, affording a view of the interior of the tower, with its western Middle Pointed window gracefully traceried and of three lights.

Our original plan was to return to Paris through Nevers, Vézelay, Avallon and Auxerre, but our devotion of a day more than we had intended to Le Mans and Tours, precluded the carrying out of this part of the programme.

So it came about that at half-past five A.M. on the ensuing Monday we were taking our last look at Bourges from the railway station, *en route* for Paris *viâ* Orleans and Etampes, it having been a "toss up" as to which of the two last-named places we should break the journey at—and Etampes won the day.

We said good-bye to Bourges Cathedral from the window of the railway carriage just as the newly-risen sun was lighting up the cross on the apse and the western towers with gold, and then, as the train carried us across the dreary district of La Sologne, we settled ourselves to finish the night's rest as well as our knapsack and the seat of a third-class French railway carriage permitted.

However we awoke just in time to see Orleans Cathedral rising up white against a cloudless sky from the vast plain. Presently we lost it, and were traversing the more interesting La Beauce, whose village churches, passed in quick succession all seemed to present the same local characteristic, viz. the gabled tower and the square east end. Many of them in case of detention or overmuch leisure would we opine repay examination.

The features just noticed occur in all the four Etampes churches, whose towers rising above the houses in bold architectural masses impart to this quiet old town an air of ecclesiastical opulence gratifying to the eye and soothing to the mind.

Among these churches, in which may be traced a line of demarcation between the Pointed of Northern and Central France, the best part of the morning was spent, page after page of a pott 8vo note-book being filled with memoranda, of which the following are a few excerpts.

Of the Etampes churches the largest and most important is Notre-Dame, one of the most irregularly planned churches we remember ever to have met with.

It embraces a choir with square end; a double north aisle also rectangular, but with its wall and arcade of separation inclining to the south; two south aisles, both apsidal, the outer wall slanting very markedly in a southerly direction; double transepts, *i.e.* two in juxtaposition; nave of two bays with very broad aisles, and a large narthex not at all in the plane of the nave, but sloping from north-east to south-west, and above which is the steeple.

This singular deviation of Notre-Dame at Etampes from the usual rectilinear form is due partly to the nature of the ground and partly to the character of the building, which is at once fortress and church. The structure in question forms by no means a solitary proof of the perils to which religion was exposed in Mediæval times, and the necessity under which Churchmen lay of calling in military assistance for the defence not only of their own lives and property, but of many others' also, who, at the approach of danger, fled to the church or monastery for protection.

St. Cecil, at Alby, is an example of those ecclesiastical fortresses which are of frequent occurrence in the South of France.

Danger appears to have been apprehended chiefly upon the eastern side of Notre-Dame, for here we find the windows placed at a great elevation from the ground, and above the chapels are casemated chambers for troops, with loopholes as in other fortifications, and it was probably with a view to greater security that the usual apsidal termination to the main choir was abandoned in favour of the rectangular one, the projecting apsidal ends of the flanking aisles serving as bastions for the defence of the high altar.

The nave of two bays has a clerestory composed of two wide lancets and a circle with inverted cusps, like those in the apse of St. Etienne at Auxerre. The remainder of the church is unclerestoried, and from the transepts the effect of the lofty arcades, owing to the double aisles on either side of the choir, with their slender clustering pillars and delicately-foliaged capitals, is exceedingly striking. The church is mainly First Pointed, but retains portions of an earlier structure, notably the steeple, whose composition, as regards the spire-lights and pinnacles, is in effect not unlike those met with in Caen and its district.

Generally speaking, the windows in the choir are tall lancets in triplets, the wall space at the apex of the central and highest lancet and between the centre and side one being pierced with a small quatrefoiled circle. The fenestration of the great double south transept is effected in each division by one broad lancet surmounted by a large wheel window. Taken in conjunction with the richly-sculptured south portal, which closely adjoins it, this transeptal façade of Notre-Dame at Etampes succeeds in producing an architectural group of much dignity and interest. Altogether this is a most remarkable church, and deserves the closest attention, whether as regards plan or detail, from the student.

St. Basile, the first of the Etampes churches encountered on emerging from the railway station, is a large cruciform structure with aisled nave, chancel, and chapels to both on the south. The exterior is almost entirely Flamboyant, though Romanesque work can be traced here and there.

The west door, restored in imitation of the original in terra-cotta, is highly enriched Romanesque.

The central tower, very low and massy, is good Transition, and has a roof of the hipped gabled form. The outer aisle of the nave being an after-thought, the transept terminates in a line with the inner one; a screen, therefore, is thrown from the outer nave aisle to that of the choir, the space within it serving as a porch. The general aspect of St. Basile internally is Flamboyant, and there is not a pier capital throughout the edifice, the arch mouldings dying off into the imposts.

In the Renaissance period the authorities appear to have been seized with a desire to classicalise the whole, and by way of commencement turned the buttresses of the south aisle into Corinthian pilasters, but they seem to have progressed thus far when, fortunately, their funds failed. An external inscription runs thus:—"Faxit Deus perficiar. 1559."

St. Gilles, another Flamboyant church with earlier remains, is pleasing from its simple solidity. Here the tower is likewise central, and terminates in a cruciform saddleback of pleasing outline and peculiar construction.

The object of the architect seems to have been the adaption of a square tower, narrower than either the nave, chancel, or transepts. Its base is square, visible above the nave roof, but hidden by the greater elevation of those of the eastern and transeptal limbs.

From the angles rise triangular slopes, as if for an octagon, and on these, as well as on the space left on each of the faces of the tower, stand equal gables—four cardinal and four diagonal. The points of the latter support the angles of a smaller square tower, whose faces fall behind the gables resting on the sides of the base.

The nave has one aisle on the south, each window being surmounted by a gable, as in many of the Belgian and German churches.

There are two aisles on the north, their internal separation being effected by an arcade carried on short Tuscan pillars with rather lofty plinths. In the chancel the vaulting shafts have that peculiar twisted moulding met with now and then in French Late Gothic work. Among the remains of the earlier church are some pier bases and caps and the western doorway, which is Romanesque, and has an arch of three orders boldly moulded with torus and hollow, the two outer orders supported by shafts set in re-entering angles. The label has a kind of large head-nail, forming a rough hexagonal pyramid.

A little distance to the south stands St. Martin's, superior to all the other churches of Etampes, as being purer and freer from Late Gothic alterations. Conceived in a very vigorous mingling of the round-arched and Pointed styles, it may be cited as an excellent model of a large parish church, quite clear of any pretensions to the cathedral type, yet embracing such features requisite for the performance of solemn functions as a procession path and three chapels, an arrangement more common in the Romanesque and Transitional churches of Central and Southern France—the Auvergnat, for example—than in those of the North. The nave and choir are comprised under one line of roof; the tower—an erection of the Renaissance closely following the old local models, and finished with a carefully moulded cruciform saddleback—leans considerably. It stands at the west end, but is detached a few feet from it.

The First Pointed work of this church is unusually fine, and a charming feature is the coupling of the alternate pillars in the apse after the fashion of those at Sens, the eastern part of Canterbury, and the apse of Coutances.

Altogether we were much delighted with Etampes, and at the appointed hour sat down in high good-humour to the *déjeuner*, seen so temptingly displayed through the open windows of the Hôtel du Grand Courrier.

It was not a little amusing after the habitués had discussed their meal to see monsieur and madame, with "la petite" between them, sit down with the whole establishment to the enjoyment of it. Involuntarily one recalled that finest chapter in "Adam Bede," wherein the early supper party at the Hall Farm is drawn with a fidelity that has rarely been surpassed.

With pleasant recollections of this richly churched old town we arrived, after a railway ride of about half an hour's duration, in the brilliant Lutetia.

(To be continued.)

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of British Architects was held on Monday evening last, Professor Aitchison, R.A., president, in the chair.

A vote of thanks was passed to the executors of the late Professor Hayter Lewis for a presentation of several books for the Institute library.

The President then delivered the following address to students:—

It is customary in this month to give an address to students, and it is one of the pleasantest duties the president has to perform.

The world consists of the past, the present and the future. The past is hopeless: it cannot be altered or improved; it can only be studied. The present, of which the practising architects are representatives, is too well known to dilate on; and the immediate future consists of the students, and they allow us to conjure up all sorts of visions, and to delight ourselves with

fancying that their works will be stamped with the perfection that ours have missed.

Aristotle tells us that most things can be equally well or better done by youth than by age; but there is one thing that age can alone give—that is, experience. I think it is a pleasure to all men of some years to convey as much of the results of their experience as they can to the young who are following in their footsteps, or are about to follow. In an art like ours it is very difficult to know what useful experience we have to impart—I mean æsthetic experience—because our views and those of the rising generation are probably different, if not opposed. I give you some remarks of Professor Cockerell to the R.A. students of my day:—"That they should study all styles, for they can never tell how fashion will change, and that the style they have chosen may not be abandoned." This was said when imitation Gothic was all the rage.

I hope for the advancement of architecture which will take every one, and that when it does come it will not be an imitation of some dead style.

At present, at least, we have no means of evoking genius, and the only means that has yet occurred to me to improve our art is by learning principles and by striving. It is true that I was found fault with by one of my hearers on a former occasion for not invoking the aid of the Almighty; but it seemed to me then, as it does now, that my business is to say as far as I can what earthly methods, and what earthly methods only, have the chance of improving us.

There is one thing I have remarked—that all the sciences and arts seem to go in cycles, or, as we should say, are mounted on Fortune's wheel, and, as it turns, one art or science is the top of the wheel while the other is in the mud, and as it goes round the positions are reversed. It is not very easy to trace the cause of these epochs, but we can safely say that, at the present moment, the epoch is that of the application of science, and is on the top of the wheel, while architecture is very low down. When these epochs occur, the whole atmosphere, as it were, is full of the desire for excellence in the particular art or science then coming into vogue, as a knowledge of Roman architecture was at the time of the Italian Renaissance; and at such times men of the most transcendent abilities have an ambition to succeed in the new fashion, even though it promise but little wealth, and very often nothing but the escape from starvation, even if it offer that. Milton's was in England a poetic age, though he got for his "Paradise Lost" little more than the price of waste paper, but he at least got an immortality of more than two hundred years, and we know not how many more centuries he will last and be studied; while poor Otway, the author of the once admired "Venice Preserved," who lived in the same century, is said to have died of starvation, and, though he was popular in his time, I am afraid there are few but professed students of dramatic literature who have ever read a line of his. A great incentive to any kind of study or achievement is that of being thought highly of by your contemporaries, though there is a higher stimulus in the hope of that sort of immortality which mortals can attain.

One of these inducements at the present time is impossible to be looked for—I mean the admiration of your fellow-men, for who knows or cares whether your work is good, bad, or indifferent, except perhaps a brother architect? I do not know if the sort of limited immortality any one can get has ever been obtained by those who have not been admired by their contemporaries; at any rate, it has not commonly been the case. Yet we hear all the unsuccessful votaries of the fine arts saying, that though their works may not be appreciated now, they will be appreciated by posterity. I have admired architecture I have casually seen without knowing the name of the architect, or whether he were alive, and thought this was by a good man, which I hope, if he is dead, may be some satisfaction to his manes. Architecture, at least in good times, does not so much represent the proclivities of the artist as the general aspirations of the people; for though the great artist seems only to portray his own ideas, he must, if popular, do admirably what every one desires to do himself, in spite of Dr. Johnson's attempted refutation of Boswell's remark that "the poet only says what every man thinks and would say":—"Then, sir, according to you, the poet is only the tailor of other men's thoughts." At any rate, architecture must have conveyed to the minds of the people when it was built the sort of effect that they desired, for models were mostly made for approval before the building was done, while to future generations it clearly speaks of the taste and inclination of the age in which it was produced. It shows the genius and knowledge of the architect and the skill and care of the workmen, so that if a ruin is seen, or a considerable architectural fragment is found, we cannot help forming a strong opinion of the taste, skill and proclivities of that age.

I think I have pretty well expressed the indifference of the present age to architecture, so that you cannot expect much honour or reverence on account of your work, or that it will cause much pleasure or delight to the living beholders. It becomes questionable whether there is enough stimulant to attract men who possess the intellectual faculties necessary for producing fine architecture, I mean such architecture as will be admired for two or three thousand years. I hope that my observation has been wrong as to the chances of immortality for those whose works are disregarded by their contemporaries, for if the architect is really before his time, he should be recognised by those that come afterwards. I cannot even give that sort of encouragement to the students that used to be given me when I was a boy—that all men had equal abilities, and the great man was merely distinguished by greater perseverance and industry, although it is quite clear that extraordinary industry and perseverance are the concomitants of genius. I think I understate the case if I say that one considerable architectural genius is to be found among 100,000 of the inhabitants of any highly civilised country. To be a great architect involves a capacity for acquiring the higher branches of mathematics and to be able to use them; to comprehend at least that branch of natural philosophy that is called statics, and even to advance beyond the point at which it has then arrived; to so arrange a building as not only to fit it for its purpose, but to put it in a shape that will command the admiration of skilled and cultivated beholders, and to invest the finished structure with a capability of exciting emotions that are proper to its use. Architecturally this is brought about by simplicity, perfection of proportion, by outline, by the proper disposition of light and shade and by size and mass. To the former qualifications of the architect must be added the capacity of knowing what additional interest can be given to important parts by sculpture, and how colour can be properly applied to the whole structure. Of course it would be infinitely better for the architect to possess the whole of these qualifications; I do not know whether this was ever the case, though Sir Christopher Wren very closely approached it. We know that in whatever excellent qualities the Renaissance architects were deficient, they were mostly sculptors or painters. Where they were deficient was in construction, in invention and in the proper expression of their buildings. According to Mr. Ruskin, all the architects of the world since the early Greek times were sculptors, and the sculptors thought, like Mr. Ruskin, that pure architecture was ridiculously easy, or came naturally to all men. I think that he was conversant with the history of the Renaissance architects, who were undoubtedly sculptors or painters, and applied these qualifications to the Greek and Mediæval architects; but as far as I can find out, there is not the slightest ground for believing it true of the Mediævals. His Excellency M. Jusserand tells us of a monk who was allowed to have a nude model to make studies from for a crucifix, but we have not the slightest hint that he was an architect as well, and the note-book of Wilars de Honecort, whom we know to have been an able architect, does not impress us by his sketches with the idea of his being a competent sculptor or painter. Some profound students of Greek literature would probably be able to confirm or deny the hypothesis that all the Greek architects were sculptors; but considering that we do not know that Phidias was an architect, it seems unlikely that the great architects were sculptors or that the great sculptors were architects. Aristotle was a great admirer of architectural art, and anyone bent on knowing whether the architects were sculptors as well might find indications of it by reading through his voluminous works to that end. Plato was evidently conversant with the craftsmen of his time, but I do not recollect any suggestion of his that the Greek architects were sculptors. We know from Trajan's letter to the younger Pliny that the Roman architects were mostly got from Greece, but we do not know whether they were sculptors as well.

Most of you probably know that Pascal considered architecture a progressive art, and we all know that it did progress most rapidly in constructive skill from the end of Romanesque days through Gothic times almost to the very end, and it also changed its æsthetic expression several times.

I think all of us desire to see architecture progress, more especially in æsthetic expression.

Since the application to building of cast-iron, wrought-iron and steel, the engineers have surpassed even the wildest imagination of sixty years ago. The Britannia Tubular Bridge is, as far as I recollect, 500 feet span, but Sir Benjamin Baker has made a span of the Forth Bridge over 1,700 feet. It is very unlikely that any architectural work would require a span of more than a tenth of that bearing, and that supposes an extension of more than double the span of the largest groined vault of the Romans, which was only about 80 feet. Still we must to a certain extent look for the advancement of architecture in a nicer adjustment of the mass to its height and to the weight to be carried, and to the form to be given to the supports for the weights and strains that come on each particular piece. In the use of iron and steel architects are very much handicapped, first on account of the slenderness of proportion which, as a rule, renders them unfit to compose with the weaker material, but mainly on account of the little resistance these materials offer to the action of fire, unless they

are protected by fireclay and terra-cotta, and when they are so protected they very nearly assimilate in size to the supports of old-world structures. Still, as I have so often said before, I think if the Mediæval architects had possessed these materials and been able to work them as we can, they certainly would not have abstained from using them, as architects of the present day have mostly done. What visions does the use of cast-iron raise in our minds as to the possible size and height of buildings? What new forms and shapes does not cast-iron suggest when we know that it will take any form we please and any ornaments that can be cast? What visions of colour does it not evoke when it may be made resplendent with enamel?

No one can say that convenience in planning is not greatly studied in the present day, but this convenience has mostly been of the purest utilitarian sort; it has been a question of how the accommodation wanted can be packed anyhow, which should not be the aim of architectural planning, which now, alas! is hardly thought of. The other thing to be aimed at is to give expression to the thoughts, cultivation and aspirations of the present day, a subject that requires the deepest study and a perspicacity that is rare, for though we are quite certain that many buildings have not got the proper expression, it is not so easy to say how the proper expression should be got. We have ransacked all the civilised architecture of the past and made collections of it for use, but we have certainly not applied the examples with discretion. The delicate ornaments and suggestive sculpture that were applied to the embellishment of the boudoirs and pleasure-houses of Renaissance beauties is now lavished on oyster-shops, public-houses and clothiers' warehouses, on which fluttering cupids are out of place, and the magnificence and stateliness of the palaces of great nobles now deck stores or hotels. We can at once pronounce these to be absurd, but we can hardly lay down a rule for the right expression which should be applied to the immense variety of buildings that are erected, for although we are familiar with the term "playful" applied to some buildings by the architects of two generations ago, we hardly know in what that playfulness consisted.

We must not forget the effects of association. Pediments were only foun t on temples during the Roman Republic, and Cicero expected to see them in heaven. Gothic with us is mostly associated with cathedrals and churches, and is therefore looked on by the public as a holy style. This, of course, is absurd, for the style in vogue was always used indifferently for all sorts of structures when there was a style; but the architects did not bestow the same character on a coal-store or a tinker's shop as they did on a cathedral, and when the outside of a building shows what is wanted in the inside, the cathedral and the tinker's shop will not be quite alike, nor should it be decked with the same enrichments.

You know that architecture is the most difficult of the visual fine arts, yet there is much more labour spent on learning painting and sculpture than there is on learning architecture, and the votaries of these fine arts commonly have more natural aptitude to start with. We know the painful years students of painting and sculpture devote to getting the ground-work of their art, while from three to five years spent in an office, mostly in tracing, is thought enough for an architect.

Although I do not think that the test of examination is a very complete one, it is better than nothing; but yet the profession generally think even this too much, and utterly declines to start a more complete one for Fellows, being afraid that a knowledge of the elements of architecture may damp the ardour of genius or clip its wings; while almost all the other professions have examinations for the two classes, and have consequently advanced at a much more rapid rate.

There are two points to which I beg to draw your particular attention—first, that architecture is a structural art, and that all an architect can do, as an architect, is to build; in his structures he has to show his knowledge, taste and skill, his learning, morals, cultivation and aspirations. The Mediæval architects in their ecclesiastical buildings showed their hopes and adoration by lanterns, towers and spires, by lofty naves, daring construction and intricate patterns. When we have arrived at their pitch of knowledge and skill we must show our parts, inventions and aspirations in similar ways—not as they did, with almost pure geometrical figures, but in more graceful, refined and daring work. Secondly, to point out the comparative scarcity of the use of coloured and glazed materials for external facings where the greatest beauty of colour and form may be used. It is refreshing even to think of London and other manufacturing towns presenting to us beautifully coloured fronts that do not want painting every year, and would render such towns cheerful, if not delightful, to look on, in the place of the dingy, sooty and depressing houses faced with stone, brick or plaster; and this would not only raise our spirits under our leaden skies and perpetual drizzling rain, but be more healthful, for glazed pottery absorbs but little moisture, and is easily cleansed from dust and soot.

I am glad to see that we have admitted ladies to the Associateship, for that allows us to avail ourselves of the abilities of at least another half of the population, and, if you will pardon the bull, the larger half, as well as to offer a small meed of justice to the fair sex.

Reports on the drawings were read by Mr. A. Beresford Pite and Mr. H. H. Statham. The prizes were distributed by the President to the successful students. We have already published a list.

THE CALIFORNIAN UNIVERSITY COMPETITION.

WE have received the subjoined official report of the reception, preparation and judgment of the plans submitted in competition for the "Phœbe A. Hearst architectural plan for the University of California":—

One hundred and five packages for the Phœbe Hearst architectural plan for the University of California arrived at the office of the United States Consul General at Antwerp. There each case was marked with a number and the date of arrival, and insured for 5,000 francs for a period of six months. Many of the packages arrived much damaged; all of the large unsealed cases and the letter belonging to one of these had been opened at the Custom House. On July 10 all of the packages were transferred from the Consul's office, and stored in a room at the Musée Royal, where they were under the protection of the city of Antwerp. The Musée Royal is fireproof, and contains some of the most valuable examples of Dutch and Flemish art.

From August 17 to 22 the plans were measured for framing. At the same time the mottoes on the plans and on all the documents connected therewith were covered and the letters of identity were placed unopened in the safe deposit vault of the National Bank of Belgium. The average time required to measure each set of plans was six minutes. Cases found damaged were replaced by new ones. One package contained a pamphlet of photographs with a typewritten description. To exhibit this scheme it was necessary to soak the photographs off the pages of the pamphlet. Later it was found that the pamphlet was only a complement to a set of plans which had arrived at an earlier date.

During the month of September the plans were mounted on stretchers. It took about thirty minutes to mount each set of drawings. From September 26 to 29 the No. 3 envelopes were opened (Nos. 1 and 2 remained closed); the mottoes on the plans were compared with those on the envelopes and the addresses on envelope No. 2 were written down. This operation lasted about ten minutes per competitor.

After the judgment the plans were cut from the frames, laid in piles, covered and sealed. The designs of the chosen authors were photographed and the others were returned to their cases, which were put into wooden boxes lest the tin tubes be damaged in transport. By October 15 all of the plans were boxed ready for shipment. Each case was insured for 2,500 francs and sent to the address given on envelope No. 2, to be delivered only against a receipt. The railway companies refusing to be responsible for the cases beyond the boundaries of Belgium, it was necessary to correspond with shippers in the various towns to which the plans were to be sent in order that the committee might be assured that each competitor had received his plans. This caused a delay of several weeks in the delivery of the plans.

It was understood that the authors of the plans wished their work to be seen by no one but the jury and their names to be unknown. Every effort was made to respect this wish. It was taken for granted that the address on envelope No. 2 gave no clue to the authorship of the plan to which it belonged. An officer of the secret police of the city of Antwerp was always present while the plans were being handled. He put his seal on everything, closed or covered and kept an account of the time the plans were being worked with. The brigadier, or chief of the guardians of the museum, was made responsible also. At night watchmen were on guard, and the Fire Department furnished firemen whenever and wherever there was need of them. While the plans were exposed special care was taken; policemen guarded all entrances, and extra men were present at night.

The doors and windows of rooms where plans were stored were kept locked and sealed, and no seal was broken without the officer and witnesses being present. Before being opened the cases were examined to see if they had been tampered with. When they were closed a band was pasted over the joint between lid and box and tied with a tape, both ends of which were fastened with sealing-wax. Before the box was reopened the seals were examined. While a drawing was on the table for measuring or for mounting the officer kept it covered, that no employé might see the composition. As soon as a design was fastened to its frame it was covered with a double thickness of paper held down with ribbons tacked down at the corners. A seal covered the tack and joint between the

cover and the frame. When a motto under cover was to be inspected one corner of the covering was raised and then re-sealed. The mottoes on the descriptions were covered in the same manner as those on the drawings.

The envelope No. 3 was opened before the jury meeting, but as soon as the address was taken and the motto noted, the letter was put into a new envelope and sealed. This sealed letter was attached to the plan to which it belonged, and remained so during the jury meeting. The book of the addresses was seen by no one except the employé who wrote them. In short, the employés of the Phœbe A. Hearst architectural plan for the University of California did what they could to merit the confidence of the authors of the plans.

The first meeting of the jury for the Phœbe Hearst architectural plan was held at Antwerp in the Royal Museum of Fine Arts. The meeting began at 9 A.M. September 30, and continued in daily session, except on Sunday, until the evening of October 4.

The jury was composed of Mr. R. Norman Shaw, Mr. J. L. Pascal, Mr. Paul Wallot, Mr. Walter Cook and Mr. J. B. Reinstein. At the beginning of the first session Mr. Pascal was made president and Mr. Wallot vice-president. Before seeing the plans the jury decided a number of questions regarding the competition and discussed the programme in detail. With regard to the plans which had arrived after July 1 the following resolution was adopted :—

Resolved:—That the jury has studied the question from various standpoints, taking into consideration the various methods of transport used by competitors, the hindrances occurring from rules and laws, varying in different countries, with regard to the bulk and weight, method of covering, &c.; the confusion arising from improperly executing the details as required by express companies, parcel services, steamships and other causes tending to retard the arrival of the packages within a reasonable time, and the fact that the express companies do not guarantee delivery within stated time. After a long and careful examination of these questions with a view to the greatest fairness, the jury concludes that all designs which arrived at the consulate within the two days after July 1 are to be exhibited, and if any plan arriving later be among those chosen the cause of its late arrival shall be investigated.

The jury decided to make its choice by elimination as indicated in the programme.

With regard to the examination of the plans, it was decided that all the designs should remain in the exhibition halls until the final decision, because the discussions arising in the final elimination might suggest merits in plans previously eliminated that would entitle them to a place among those finally selected.

On the first and second elimination all of the jury worked together, and no plan was eliminated if any one juror objected.

On the first elimination forty-four plans were retained, fifty-four rejected.

During the second elimination one plan that had been retained in the first elimination was rejected, and two that had been rejected in the first were retained. These last two, however, were not among the twenty-one which remained after the second elimination.

On the final elimination, each juror separately chose of these twenty-one such plans as he thought worthy of being retained for the final concours, and made a list of the numbers he preferred. These lists were then compared and the numbers occurring on the majority of lists noted.

After discussion of the plans receiving no votes or a number of votes less than the majority, no plan was eliminated if any one juror objected. Before making a final choice the jury re-examined all of the plans previously eliminated.

Upon the final vote, four plans received one vote each, and eleven plans received the unanimous vote of the jury and were declared the choice for the final concours. The letters corresponding with them were opened and the authors notified of their success. The jury then adjourned.

Upon receiving a verbal report of the proceedings of the jury, Mrs. Hearst expressed a desire that the authors of the four plans receiving one vote each should receive some reward, which matter was naturally left to the trustees for consideration.

The people of the city of Antwerp did all in their power to make their guests comfortable and to insure the competitors against indiscretion and harm. They deserve the gratitude of everyone interested in the competition. Special thanks are due to Mr. Van Reijswijck, the burgomaster, Mr. Van Kuyck, echevin of the Fine Arts, M. Koch, conservateur of the Fine Arts, and to the echevins, Mr. Van den Nest, Mr. Desguin, Mr. Goemaere and Mr. Verspreeuven.

To the authors of the designs is due something more than gratitude. Men who can with enthusiasm give their trust, time and work to an enterprise of a distant country are the makers of history.

The following are the names of the eleven authors invited for the second concours :—

MM. Barbaud & Bauhain, 2 Boulevard Henri IV., Paris.

M. E. Bénard, 29 Boulevard Péreire, Paris.

Herr Professor F. Bluntschli, 4 Stockgasse, Zurich.

Messrs. D. Despradelles & Stephen Codman, 6 Beacon Street, Boston, Mass.

Herr Rudolf Dick, 99 Josefstâdterstrasse, Wien VIII.

Mr. J. H. Freedlander, 24 West Twenty-second Street, New York.

MM. G. Héraud & W. C. Eichmuller, (Arcueil) 3 Rue des Tournelles, (Paris) 18 Rue de l'Odéon.

Messrs. Howard & Cauldwell, 10 and 12 East Twenty-third Street, New York.

Messrs. Howells, Stokes & Hornbostel, 46 Cedar Street, New York.

Messrs. Lord, Hewlett & Hull, 16 East Twenty-third Street, New York.

Mr. Whitney Warren, 160 Fifth Avenue, New York.

The following are the names of the four authors mentioned above as recommended to receive some reward :—

MM. Joanny Bernard & Robert, 58 Rue de Rome, Paris.

M. Charles des Anges, 66 Rue Ampère, Paris.

Mr. Ernest Flagg, 35 Wall Street, New York.

Mr. Fred Skjold Neckelmann, 21 Kriegsbergstr, Stuttgart.

J. B. REINSTEIN,

Chairman of the committee of the Phœbe A. Hearst architectural plan for the University of California.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. G. H. Fellowes Prynne, president, in the chair.

The following were elected members of the Association :—Messrs. B. E. Crockett, L. W. Grace, C. B. S. Shepherd, E. E. Shrewsbury, Montagu White, R. E. Peach, A. Potter and C. C. Thompson.

It was announced that the first spring visit was fixed for February 4 to the Carlton Hotel, Haymarket, by permission of the architect.

Mr. Beresford Pite delivered a lecture entitled—

Ancient and Modern Buildings in Palestine.

Mr. Beresford Pite said it would be impossible for him to deal with the subject in a thorough way in one lecture. He could only relate what had struck him most when he visited Palestine. The lecturer then showed how the architectural interests of Palestine began with caves and rock tombs, cisterns and oil and wine presses, and then the buildings. The variety of influences which passed over the land in its early history had its effect on the people and their work. Beginning with Egyptian influence, they came to periods when Phœnician, Assyrian, Græco-Roman and Roman styles could be traced. Then the history of the country became obscure as they passed through dark ages to the Arab period. The years of crusading followed, dotting Palestine with interesting examples of Mediæval art. Turkish sway, too, had left its memorials, and as landmarks of modern work and travel some buildings presented the strong characteristics of the Gothic Revival. Apart from the artistic and historic periods there was the material to be considered. The building material most ready to hand was a hard limestone, difficult to work and offering little opportunity for ornamentation. The soil of the land was poor and yielded but scanty crops of coarse grain, so that when seeking to copy from nature the native imitated the heaviness of his surroundings. The country was also the seat of endless wars and disasters, so that durability and not beauty was the great aim of those engaged in architecture. The lecturer then gave some practical hints to those who might have to design for buildings in Palestine. The consideration of aspect was most important. It was always well to avoid an eastern aspect, and near Jerusalem itself it was advisable to turn the building away from the road because of the quantity of dust, which was terrible during the hot months when there was a drought of water. There were only two wells in Jerusalem, and the city was wholly dependent on the rainfall for its supply of water. In the absence, therefore, of a water supply the cost of water had to be seriously considered. If water ran out during building operations it meant an increase in the cost of construction. It was therefore necessary to begin building operations by constructing and excavating a cistern for the season's rainfall, thus providing against the drought which would certainly arise during the hottest months. There was an absence of any system of drainage, and no kind of cesspit could be properly adopted because of the hardness of the rock and the small depth of earth which covered it.

When designing a building the arrangements for heating had hardly to be considered. Fireplaces resembling ours were not generally used. In buildings established for the protection of Russian subjects Mr. Pite said he noticed more attention had been paid to the heating of the building, and stoves had often been adopted. The carriage of materials was a most

important item when doing work in the East. The railway could only carry coal, so that it was impossible to send up heavy material in large quantities. Camels were the beasts of burden. In order that foreigners might erect a building of any size a royal firman from Constantinople was necessary, and even when this Imperial permission had been obtained the local authorities had to be pacified and a liberal amount of backshish expended before operations could be commenced. If mosques were in the vicinity of the site the permission was more difficult to obtain, the religious traditions and superstitions of the case bearing an important part in the negotiations. There seemed to be no builder, and consequently no contractor, in Jerusalem; but still the lecturer, with the assistance of a German architect resident in Jerusalem, had overcome such difficulties. Plans made in London had been carried out with the utmost accuracy. The workmen would only recognise one master, and thus the man who gave the orders must also have the paying of the men engaged on the job. There was an entire absence of sand for building purposes, but a good supply of lime was to be obtained.

Mr. Pite then gave a list of the prices charged for work in Jerusalem :—

Roofing.—Tiles came from Marseilles and cost 25 francs per 1,000. The work was wired to battens; rewiring was necessary every ten years.

Bricks.—The best were foreign, the native ones were worth nothing. Bricks cost from 7 to 12 francs per 100 (*i.e.* 4*l.* to 5*l.* per 1,000).

Paving Tiles cost from 6 to 8 francs per square metre.

Timber.—About five times the cost paid at home.

Building cost for cubing about 12 francs per cubic metre, about 10 francs for foundations, and cisterns 10 francs.

Lime costs about one-twelfth of whole building; lime costs about one-fifth of cost of wall, including probably plastering; for girls' school (not plastered), one-seventh to one-eighth.

Walling.—Stones for inner side 1 piastre each, for outer side, hewn, 2 piastres each. Lime, 5 to 6 piastres. Wages and hauling, 10 piastres, or in all, 12½ francs per square metre. Foundation walls, 10 to 11 francs, above ground, 14 to 16 francs; partition walls, 10 francs; dolma walls, *i.e.* wooden framework filled with framing, 6 francs; vaulting, 8 francs—all per square metre.

Various details.—Façade stone, 100 pieces, from 10 to 14 francs. External pointing, ½ franc per square metre. Corner stones or quoins, 2 francs each. Lintels and cornices, 3 francs per lineal metre, or 40 francs per door and window opening. Plastering, 1½ to 2 francs per square metre. Cementing new cisterns, 3½ to 4 francs. Plastering ceiling, 2½ francs. Tile roofs, including wood, labour, nails, &c., 12 francs; with heavier woodwork, 15 francs. Carpentry for window, glazed, painted and fixed, 50 francs. Per internal door complete, 50 francs; per pair of shutters complete, 40 francs. Iron bars fixed, ½ franc per kilo. Girls' school, Jerusalem, including boundary wall, gate-house and cistern, and clearing site, about 12 francs per cubic metre. Not plastered.

About fifty lantern slides were shown on the screen, the lecturer giving a short description of each.

Mr. A. C. Dickie, who proposed a vote of thanks to Mr. Pite for his interesting lecture, said he had listened to the remarks with the greatest possible enjoyment. The more modern Jerusalem had really few attractive features as regarded the construction of buildings. New settlements were springing up outside the walls of the old city, and German shops were being opened. One of these settlements or villages had become famous, inasmuch as old and empty petroleum tins had been largely employed in its construction. The Kaiser's visit to the Holy Land would long be remembered by those interested in the antiquities and beauties of Palestine. Prior to the Kaiser's visit to Jerusalem, when the authorities were trying to improve the look of streets, &c., several acts of vandalism were committed. Although the streets were then said to present a cleanly appearance, it was hardly true, as the refuse and dirt of the principal streets were merely swept into the smaller and less frequented ones. Where old gilt-work in mosques had become dull, a little yellow paint was used to restore (such was the taste of the Turk) its first charm.

Mr. Alexander Payne, who seconded the vote, said that although Palestine possessed attractions peculiar to itself, yet it was a disappointing country in some things. The tourist had to be well prepared for emergencies, as travel was expensive and really slow. The "squaring" of officials in order to travel in safety was tremendous, but long journeys were out of the question unless backshish was freely given.

Mr. R. Phené Spiers, who supported the vote, said different dates were often given to the buildings. The dates of them had, however, been clearly shown in the work of the late Professor Hayter Lewis on the Holy Places of Jerusalem. In some instances where an old building had been demolished it had been rebuilt with the old material. The immense stones used in the construction of older buildings showed Roman influence, although contrary to their method. The Romans had recourse to the labour of the country, and they believed in monolithism, two facts which help to prove the theory.

The President summed up the discussion and put the vote, which was carried unanimously.

Mr. Pite, in returning thanks, advised students to study more deeply the subject he had but touched upon.

On the motion of the chairman the following resolution was passed :—"That this committee, recognising and appreciating the efforts made by the London County Council for the embellishment of London, views with the utmost concern the manner in which it is proposed to rebuild Vauxhall Bridge, and desires to express its sense of the unfitness of the design for a work of such architectural importance."

THE DUMBUCK CRANNOG.

AT the monthly meeting of the Glasgow Archæological Society on the 19th inst., Mr. W. A. Donnelly, Bowling, read a paper on the crannog which he discovered at Dumbuck, on the Clyde, in July last. He stated that immediately after the discovery he intimated it to Dr. Anderson, of the Society of Antiquaries, and as a result Dr. Munro visited the crannog. He made a number of incisions within the circuit of what appeared to be the boundary line of the crannog. These excavations revealed the presence of timber, and Dr. Munro expressed the opinion that the structure had all the features of a crannog besides others hitherto unknown to him; in fact, that the find was unique. On the following day Mr. Bruce and Mr. Miller, of the Helensburgh Society, and a number of friends visited the crannog, and made a more extended examination and excavation. Mr. Bruce was fortunate in discovering the presence of osseous remains. Several stones showing signs of human labouring were found, particularly a hone, which showed that some other materials had been ground upon its surface. Subsequently operations were conducted under the auspices of the Helensburgh Society, and these had resulted in the discovery of the objects which had excited so much interest. Dr. Munro made a second visit to the crannog and emphasised the high opinion he held of the find at the beginning. The structure was a pile dwelling. As to its probable antiquity, it was notable that in all the hundreds of tons of débris carefully excavated not a single trace of either pottery or metal of any kind had been found. That pointed to a period long before a Roman galley appeared on the silver waters of the Clyde. The paper was illustrated with numerous limelight pictures from original drawings by Mr. Donnelly, and a large number of the articles discovered were exhibited.

Mr. John Smith said that the question had been raised in the newspapers as to whether this was or was not a crannog, but nobody in his senses could say it was not a pile structure. There could not be the slightest doubt that it had been inhabited. The individual who said that this was not a crannog did not know what a crannog is. He hoped Mr. Donnelly would continue and complete his investigations to the satisfaction of all intelligent archæologists.

Mr. Neilson was inclined to think that what had been found represented a period well into the dividing line between geology and archæology. With regard to the allegations that some of the articles discovered were forgeries, he felt sure he expressed the opinion of the meeting when he said that they entirely repudiated all sympathy with such statements so far as Mr. Donnelly and his friends were concerned. They were sure that they would be above that sort of thing. The crannog was one of the most important archæological discoveries of recent years.

Mr. Bruce said that the charges that had appeared in the newspapers had caused Mr. Miller, Mr. Donnelly and himself some concern. The visitors to the crannog, however, believed them rather than those who cast suspicions upon the articles discovered. He had dug out several of the articles in dispute, and he could assure them of their genuineness. It was quite impossible that anyone could have taken advantage of them.

Mr. Donnelly, replying to a question, explained that the bones discovered had not been examined by an expert, but that it was proposed to ask Professor Clelland's opinion regarding them.

Mr. J. Dalrymple Duncan expressed regret that observations had been made in the daily press calculated to hurt not only the feelings of the investigators, but also to discourage other workers on similar lines in other parts of the country. He had the pleasure of spending a day at the crannog with Mr. Munro on the occasion of his second visit, and he was rather surprised that Dr. Munro, after what he then said, should have altered his opinions. Dr. Munro did not on that occasion indicate any of the views which he had subsequently expressed in the newspapers except those with regard to the shale ornaments. Both at the crannog and in returning from it in the train, Dr. Munro spoke to him as if the discovery was

of very great interest, and he was sorry, because all of them must have great respect for Dr. Munro as a very great authority on the subject, that he should have been led into writing the letters which he had written. However, Mr. Donnelly would have the consolation of knowing that the great mass of those who had both seen the crannog and heard the accounts of these discoveries recognised that he had made a most important find, and that there was not one person in a thousand who had the slightest doubt as to the thorough honesty of himself and of those who had worked with him.

The chairman (Dr. Murray), in moving a vote of thanks to Mr. Donnelly for his interesting paper, said he was sorry it should have been thought necessary that anything should be said with regard to the suggestion of forgery. He thought that was a question to which prominence should not be given by discussing it. The discovery of the crannog was a matter of very great interest. The shale articles found were proof of the genuineness of the discovery. Similar articles had been discovered in the valley of the Clyde, and that had a good deal to do with the age of the structure, which, he thought, would take them back to somewhere about the period of the Roman occupation. He thought it was utterly out of the question to say that the articles were palæolithic, but undoubtedly they might be neolithic.

TESSERÆ.

Architecture and Criticism.

ALTHOUGH educated men generally have a fair knowledge as to the facts of architecture—that is to say, as to the styles in vogue at various periods and the history of the rise and fall of the various styles—they very rarely attempt to exercise their critical faculties or to form any definite opinion as to why one building is admirable, another blameable, one noticeable for the perfection of the art displayed in it, another for the imperfection. It is impossible to doubt that the exercise of active criticism is essential to the healthy progress of all the arts. Without it the artist falls asleep, makes no progress and finally becomes uninterested in his work. With it each appreciative criticism spurs him on to fresh efforts, and his work is of necessity a continual advance. Now this sort of criticism is impossible if attempted with nothing but a dry knowledge of the history of architecture, it has no life in it, no power of affecting the artist. For this it is necessary that the critic should have mastered the artistic principles developed in the style to which he attaches himself, and be able to define and distinguish clearly what is right and what is wrong in each, and so to appreciate the subtle difference between work which marks the great artist and that which only shows the patient truthful workman. It is far too much the custom to assume that all ancient art was equally good; that men wrought under such rules, possessed such traditions and adhered so carefully to the same grooves or channels in art, that there is no choice to be made between the works of one old architect and another, all being equally admirable and equally deserving of imitation. If this were so we should be obliged at once to wipe out architecture from the list of the fine arts altogether, knowing this very well, that no art can be practised under such conditions, and that without personality and individuality of character no artist—whether painter, sculptor or architect—can ever impress any great and lasting value on his work.

The Picturesque in Ireland.

Travelling in England awakens less of the springs of dramatic interest, will engage the passions less than travelling in Ireland, where the dark bleak bog and moor contrast with the vivid green of her beautiful fields; the lofty mountains, the lesser undulating hills and sequestered valleys—the intermixture of severest sterility with tracts of pasturage, which, in native strength of production, fattens an ox to the acre—the wild woods too scantily relieving the heathery sides of the mountains, the clear and sparkling streams, the generally respectable and often noble rivers, pastoral all, and the numerous lakes, diverse and multiform in size and shape and beauty, cast over the surface of Ireland. Then the Danish raths or forts, crowning almost every eminence; the relics of old chapels mocking calculation of their dates, and surrounded by the tumuli of a race who seem destined never to find repose but in death; the round towers equally mocking antiquarian conjecture of their uses; the proud monastic ruins that, relatively to the state of society, still proclaim the gorgeous temporalities of the Church before the period of the Reformation, and in the rich and happy choice of their sites tell of the superior wealth, power and worldly enjoyments of the priesthood through all its orders. At various points of view the high lonely castle and quadrangular towers, within whose strong and gloomy walls the rude chiefs or toparchs of ancient days lived in reciprocal fear and hatred, snatching their physical enjoyments from the steel grasp of danger, and maintaining their feverish and hazardous existence—their constantly disputed and barbarous dominion—by international warfare. Such inanimate memorials of the barbaric ages can scarcely be said to meet the eye of a traveller in England.

International Competition.

The most superficial glance at the present condition of European states shows that those nations which linger in the race cannot hope to escape the partial diminution, and perhaps final annihilation of their resources. It is with nations as with nature, which, according to a happy expression of Goethe, knows no pause in ever-increasing movement, development and production—a curse ever cleaving to standing still. Nothing but serious occupation with chemistry and natural and physical science can defend a state from the consequences of competition. Science and information are the joy and the justification of mankind. They form the springs of a nation's wealth, being often, indeed, substitutes for those material riches which nature has in many cases distributed with so partial a hand. Those nations which remain behind in manufacturing activity, by neglecting the practical application of the mechanical arts and of industrial chemistry to the transmission, growth or manufacture of raw materials; those nations among whom respect for such activity does not pervade all classes, must inevitably fall from any prosperity they may have attained. This result follows the more certainly and speedily as neighbouring states, instinct with the power of youthful renovation, in which science and the arts of industry operate to lend each other mutual assistance, are seen pressing forward in the race.

GENERAL.

Mr. Walter Emden has been placed by the Board of Trade on the list of surveyors and umpires, from which selections are made by the Board of Trade for appointment in cases of disputed compensation for land.

Mr. Stanhope Forbes, A.R.A., has completed the mural decoration, "The Great Fire of London, A.D. 1666," which he has been commissioned by the Sun Insurance Office to paint for the ambulatory of the Royal Exchange.

M. Cormon, the latest member of the Académie des Beaux-Arts, has been presented by his pupils with a sword of honour, which is part of the official uniform of all members of the Institut.

The Late T. Hayter Lewis has bequeathed 100*l.* to the Architects' Benevolent Society out of a fortune of 88,789*l.*

M. Léon Charvet, architect and inspector-general of instruction in design, has been awarded a gold medal by the Société d'Architecture du Rhône for his book on "The Architects of Lyons."

M. Waltner, the French etcher, has been promoted to the rank of commander in the Legion of Honour.

The Bishop of Bath and Wells presided over a meeting of citizens at the Guildhall, Bath, on Tuesday, to consider the question of restoring the west front of Bath Abbey, in connection with the four-hundredth anniversary of the edifice to be celebrated this year. The Bishop said they aimed more at the repair of what already existed than at restoration with a free hand.

A Series of Lectures will be delivered in the Lecture Theatre of the South Kensington Museum on the following Saturdays, at 3.30 P.M.:—January 28 and February 4, Dr. Lockyer, M.A., F.R.A.S., "Astronomical Instruments"; February 11 and 18, Mr. J. H. Pollen, M.A., "Furniture"; February 25 and March 4, Mr. William Burton, "Pottery." Admission will be free.

Mr. T. Butler Wilson, architect, of 72 New Bond Street, W., and Harrogate, Leeds, informs us that he has taken into partnership Mr. Robert P. Oglesby, who has been associated with him for the past fifteen years, and that in future the style of the firm will be T. Butler Wilson & Oglesby.

Major-General T. Kelly-Kenny, C.B. (Inspector-General of Auxiliary Forces), will present the prizes to members of the Artists' Rifle Volunteers at the annual distribution on Thursday, the 2nd proximo, at 8.30 P.M., at the Headquarters, Duke's Road, Euston Road, W.C. A regimental concert will follow.

The Applied Art Section of the Society of Arts will commence the meetings on Tuesday evening, January 31, when Mr. Edward F. Strange will read a paper on "The Centenary Exhibition of Lithographs." At subsequent meetings during the session papers will be read on "Vitreous Enamels," by Cyril Davenport, February 21; "Craftsmanship and its Place in a National Scheme of Art Culture," by Sir William Blake Richmond, K.C.B., R.A., March 14; "Modern Changes in Taste relating to Domestic Furniture," by George Lock April 18; "Maiolica," by William Burton, May 2; and "Wrought-iron Signs," by J. Starkie Gardner, F.G.S., May 30.

Messrs. T. Cook & Son have organised a series of tours to Italy and Rome which are well adapted to meet the requirements of students of art.

THE
Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London W.C., not later than* 2 P.M. *on Thursdays*

NEW READING CASE

To Librarians of the Public Libraries and Reading Rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s. by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITION OPEN.

BRADFORD.—April 14.—Designs will be invited for the erection of the Bradford Corporation Cartwright Memorial Hall, at a cost of 38,000*l.* Three prizes will be offered, value 150*l.*, 100*l.* and 50*l.* respectively. Particulars will be found in another column.

COMPETITION DECIDED.

CREWE.—For erection of a clubhouse. The designs of Messrs. Wm. Sugden & Son, F.R.I.B.A. (submitted under motto "Forward the Light Brigade"), have been placed first, and the work will be carried out by them.

CONTRACTS OPEN.

ABERGAVENNY.—For erection of the Abergavenny new joint cottage hospital and dispensary. Mr. E. A. Johnson, architect, Abergavenny.

ANGLESEY.—Feb. 1.—For erection of a school for the Rhosybol School Board, Anglesey. Mr. Richard Davies, architect, 125 High Street, Bangor.

ANGLESEY.—Feb 6.—For extensions to the Welsh C. M. chapel at Benllech. Mrs. Jos. Owen, architect, Menai Bridge.

BANBURY.—Jan. 31.—For improvement of the public swimming-bath in the recreation-ground. Mr. N. H. Dawson, borough surveyor, Town Hall, Banbury.

BARNSLEY.—Feb. 3.—For erection of a school for infants at Staincross, near Barnsley. Messrs. Senior & Clegg, architects, 15 Regent Street, Barnsley.

BELFAST.—For erection of premises, Old Lodge Road and Hanover Street. Messrs. E. & J. Byrne, architects, 4 Waring Street, Belfast.

BEN RHYDDING.—For erection of two pairs of semi-detached villas at Ben Rhydding. Messrs. Isitt, Adkin & Hill, architects, Prudential Buildings, Bradford.

BERWICK-UPON-TWEED.—Jan. 31.—For erection of lock up and police station in Church Street. Mr. R. Burns Dick, architect, 55 Northumberland Street, Newcastle-upon-Tyne.

BIRMINGHAM.—Jan. 30.—For erection of nurses' messroom and other accommodation at the workhouse infirmary. Mr. R. H. Ward, architect, Paradise Street, Birmingham.

BOOTLE.—Feb. 1.—For erection of a technical school in Balliol Road. Mr. Edward Reid, surveyor, 7 Westminster Chambers, Crosshall Street, Liverpool.

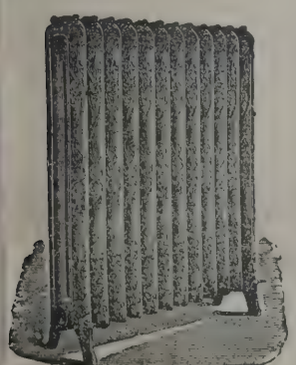
BRACKENTHWAITE.—Feb. 3.—For erection of two bridges over Hope Beck. Mr. J. B. Wilson, Court Buildings, Cockermouth.

BRADFORD.—For erection of a combing-shed and warehouse at Dudley Hill. Mr. Fred Holland, architect, 11 Parkinson's Chambers, Hustlergate, Bradford.

BRANSCOMBE.—For erection of a Wesleyan chapel and school Rev A. Martin, Budleigh Salterton.

BURNLEY Feb. 1.—For extension of central stores, Hammerton Street. Mr. Thos. Bell, architect, 14 Grimshawe Street, Burnley.

BURTON-UPON-TRENT.—Feb. 1.—For widening the bridge crossing the Midland Railway, Horninglow Street, and alterations to existing buildings adjoining thereto Mr. George T Lynam, borough engineer



CAMBERWELL.—Jan. 31.—For construction of a [illegible] ground convenience in Rye Lane. The Surveyor, Vestry Hall, Peckham Road.

CARDIFF.—Jan. 31.—For extensions to the electric-lighting station, Eldon Road. Mr. W. Harpur, borough engineer, Town Hall, Cardiff.

CARDIFF.—For alterations at the Royal Hotel. Messrs. J. P. Jones, Richards & Budgen, architects, 18 St. Mary Street, Cardiff.

CARDIFF.—Feb. 11.—For extension of the mortuary at the workhouse. Mr. Edwin Seward, architect.

CARLTON.—Feb. 4.—For erection of a classroom to Carlton Board schools. Mr. W. E. Richardson, architect, 28 Bond Street, Leeds.

BERRY, CAMPBELL & CO.

WARMING & VENTILATING ENGINEERS,

62 WATLING STREET, QUEEN VICTORIA STREET.

Heating by Hot Water, or High or Low Pressure Steam, expeditiously carried out on the most approved principles. Special attention given to Private Residences.

ESTIMATES FREE.

CHATHAM.—Feb. 2.—For erection of stables for the Corporation. Mr. Charles Day, borough surveyor, Corporation Offices, Military Road, Chatham.

CHORLEY.—Jan. 30.—For erection of buildings at pumping station near Grimeford Mill, Anderton; construction of storage reservoir near Roscoe Low Quarry, Anderton; and construction of sewage purification works at Coppull. Mr. Alban Jolly, surveyor, 9 High Street, Chorley.

CHURWELL.—For erection of a 14-chamber kiln, chimney and brickwork. Mr. Frederick W. Rhodes, architect, Upper Wortley.

COVENTRY.—For erection of classrooms at the West Orchard Chapel. Messrs. Geo. & Isaac Steane, architects, 22 Little Park Street, Coventry.

DALTON-IN-FURNESS.—Feb. 2.—For additions and repairs to Low House Farm, Ayeside. Messrs. W. Butler & Sons, Dalton-in-Furness.

DEWSBURY.—Feb. 3.—For erection of two houses in Lees Road, Thornhill. Messrs. Holtom & Fox, architects, Westgate, Dewsbury.

DONEGAL.—Feb. 1.—For alterations to premises at Cross-Roads, Killygordon, co. Donegal. Mr. J. Crawford, secretary, Crossroads, Killygordon.

DUBLIN.—Feb. 8.—For erection of six labourers' dwellings as follows:—two to be erected in the townland of Blanchardstown, and four upon a plot of ground at Ballycoolen, all in the electoral division of Blanchardstown. Mr. John O'Neill, clerk, Board Room, North Brunswick Street, Dublin.

DURHAM.—For erection of branch store, recreation-room, and cottages at Chopwell, Durham. Messrs. Liddle & Browne, architects, Prudential Buildings, Mosley Street, Newcastle.

DURHAM.—Jan. 31.—For erection of an additional classroom and other works proposed to be executed at Windy Nook school. Mr. H. Miller, architect, Board Offices, Felling.

DURHAM.—Feb. 3.—For erection of a five-roomed house, with attic in Bridge Terrace, Annfield Plain. Mr. Jas. Norman 24 Bridge Terrace, Annfield Plain.

EXMOUTH.—Jan. 31.—For erection of engineering and smiths' shops at the docks, for the Devon Dock, Pier and Steamship Company, Limited. The Secretary, Dock Office, Exmouth.

GATESHEAD.—For erection of a nurses' home, Coatsworth Road. Mr. L. H. Armour, 16 West Street, Gateshead.

CARDIFF NEW TOWN HALL.

ON Friday last a special meeting of the town hall committee of the Cardiff Corporation was held at the Town Hall, Alderman Ramsdale being in the chair. Mr. Lanchester, one of the architects of the new Town Hall, was present, and the revised plans for the new Town Hall were discussed. They show several rather important alterations. The elevation of the main building has been raised 6 feet, an alteration which has the effect of bringing the whole into much better proportion. The front elevation shows an increase in width of some 20 feet, which thus allows of the addition of several small rooms inside. These alterations, however, will necessitate an additional expenditure of 30,000*l.* to that decided upon in the first instance. Councillor Veall called attention to the fact that in the Law Courts a room had not been set apart for the use of members of the Press. The architect said that there was one more consultation-room than was needed. On the motion of the chairman it was resolved unanimously that one of the rooms marked in the plan "consultation-room" be set apart for the use of representatives of the Press. The amended plans were adopted on the motion of Alderman D. Jones.

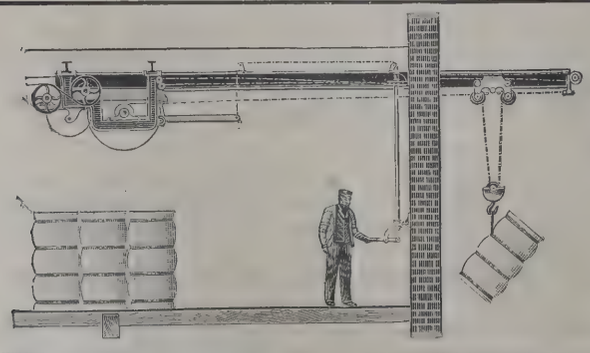
NEW CATALOGUE.

WE have received a copy of the new 1899 Catalogue issued by the Thornton-Pickard Manufacturing Company, Limited, which is in every respect worthy of the high reputation this company enjoys for first-class work. Amongst the many excellent appliances referred to, we notice mention of a new "Ruby" convertible lens, new luggage carrier, new "Ruby" cameras in the quarter-plate and 5 by 4 sizes, as well as improvements in the plate-holders. The catalogue is profusely illustrated by reproductions of many of the photographs which secured prizes in the recent competition held by the company; and, doubtless, the 25,000 dealers, professionals and amateurs, to whom we understand the catalogue is posted every year, will consider this to be one of the good things that come to them gratuitously through the post, and which is worth preserving for handy reference.

ELECTRIC NOTES.

AT a meeting of the Grimsby Town Council last week, it was decided to apply to the Local Government Board for consent to borrow 43,500*l.* for the carrying out of necessary works for the production and supply of electric light and power in the borough.

PROFESSOR RAY LANKESTER, director of the Natural History Department of the British Museum, South Kensington, writes to the *Times* that arrangements have been made by the trustees for the supply of electric lighting to the Museum. The electric light will be gradually introduced into the various parts of the large building—first of all into the offices and studies of the staff and the workshops in the basement, then into the various public galleries.



IT is stated that the promoters of the two Lancashire electricity schemes intend to ask the assent of the Standing Orders Committee to the suspension of the Orders. Even if the committee decides against them, they can proceed with regard to the other districts which have not opposed at the preliminary stage. Members of Parliament are being actively canvassed to support the second reading of all the measures, and to let the matters at issue be fought out in committee, and both promoters and opponents express the utmost confidence at the result. About 700 different places in Lancashire and Cheshire are still affected by the mutilated measure.

AT a special meeting of the Burgh Commissioners of Fort William held last week the following resolutions were carried:—That the establishment of industrial undertakings throughout the Highlands of Scotland by utilising the vast water power at present lost for the development of electrical power ought to be supported by all desirous of seeing the Highlands again peopled, and that under more prosperous conditions; that if the Highland Water Power Bill at present before Parliament be passed, permanent employment will be given to hundreds of people who are at present compelled to leave the country to seek employment in other lands; and this meeting, realising the importance of the scheme from that point of view, resolves in every way to support the Bill; and that the meeting earnestly hopes the whole of the proprietors of the lands concerned will give the scheme their hearty support, as it must not only be beneficial to the district but also to the whole of the Highlands; that the meeting is convinced that this scheme is the pioneer of many other similar schemes, and that therefore it is not merely of importance to the Highlands of Scotland, but of national importance that the Bill should be passed.

IN the Manchester Town Hall on Tuesday a meeting was held of the executive committee which was appointed at the recent conference of municipal corporations in Lancashire and Cheshire on the subject of the proposed Electric Power Bills. The chair was taken by the Lord Mayor (Mr. W. H. Vaudrey), and the Corporations of Liverpool, Manchester, Salford, Oldham, Blackburn, Bolton, St. Helens, Stockport, Bury, Wigan, Southport and Chester were represented. It was resolved that communications should be made with all the municipal corporations in the area of the conference, urging them to adopt resolutions for opposing the second reading of the following bills:—General Power Distributing Company, Lancashire Electric Power Company, South Lancashire and Cheshire Electricity Company, Leicestershire and Warwickshire Electric Supply Company, and the Midland Electric Power Distribution and Lighting Provisional Order. It was also decided to ask the Corporations concerned to affix their seals to a petition against the Lancashire Electric and South Lancashire and Cheshire Bills, and that the secretary of the Association of Municipal Corporations be authorised to act as the Parliamentary agent of the conference.

THE Lancashire Electric Power Company's Bill was before one of the examiners of proofs of compliance with standing orders in the House of Commons on Tuesday. Petitions had been lodged against it by the Warrington Corporation and the

Vol. LX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

Ormskirk, Lathom, Burscough, Stretford and Dunkinfield Urban District Councils, alleging that standing orders had not been complied with. By the measure it is proposed to obtain powers to supply electricity for all purposes over an area practically covering the whole area of Lancashire south of the Ribble, and only omitting a very small portion on the Yorkshire border, where there is no population. The area also extends into Cheshire as far as the estuary of the Dee. The boundary then branches off directly east to the estuary of the Mersey, and in a rather zigzag fashion to Macclesfield, which borough is also included. The examiner decided that standing orders had not been complied with, the promoters having in their notice referred to a map instead of describing the area of supply.

A BILL to provide for a central electrical generating station for the supply of electricity within certain portions of Leicestershire, Warwickshire and Derbyshire has been deposited for introduction into Parliament next session. The Bill proposes to incorporate and confer powers upon the Leicestershire and Warwickshire Electric Supply Company to acquire about 35½ acres of land at Hinckley, in Leicestershire, on which to erect a huge generating station for the distributing of electricity direct from the company or in bulk to any Corporation within their area of supply, "provided that notwithstanding anything shown upon the deposited map this company shall not supply any part of the county of Nottingham." The share and loan capital of the company is to be 1,000,000*l.*, of which 250,000*l.* may be raised on mortgage. The profits of the company are to be fixed at 10 per cent., but subject to an increase of 5*s.* per cent. for every one-tenth of a penny per unit at which the "energy" may be supplied below the standard price of 2½*d.* per unit. The Bill further provides that "Nothing in this Act shall be construed to confer upon the company the exclusive right to supply energy within the area of supply, or to hinder or restrict any other body, company, or person from supplying or increasing their present supply of energy within the said area, nor shall the company at any time hereafter by reason of any competitive supply be entitled to any compensation for alleged vested interest in respect of any of the powers conferred upon them by this Act."

IT is proposed to erect a Sunday school in connection with the Ebenezer Congregational Church, West Bromwich, at an estimated cost of 2,500*l.*

BUILDING AND BUILDERS.

THE Grimsby Town Council decided at a meeting held last week to accept the tender of Messrs. Hewins & Goodhand to carry out drainage work in Eastgate for 460*l.* 8*s.*

CONTRACTS for the building of a large new hotel in Guild Street, Aberdeen, adjoining the offices of the Great North of Scotland Railway, have been accepted. The hotel will cost over 12,000*l.*

THE erection of the chancel to Holy Trinity Church, Aberystwyth, will be completed by May, when it will be consecrated by the Bishop of St. David's. The cost of the chancel will amount to about 2,400*l.*

THE Church people of Blaenau-Festiniog, Merionethshire, are making a great effort in the way of Church extension. There are at present in this parish of 13,000 inhabitants two churches and two chapels of ease, but the parish church is quite unworthy of its name. It is intended to entirely rebuild the latter, and erect a vicarage and a church house, at an estimated expenditure of 6,000*l.*

AN alarming escape from instant death has occurred to a Leeds plumber. The man for the past few days has been engaged upon a house in course of construction off Johnson Street, and slipped on the roof-board. He slid down the slates with great rapidity, and fell a distance of more than 30 feet. Below was a large tank containing several feet of freshly washed lime. The man plumped head first into the mess, which was splashed half-way up the side of the building. When hauled out he was found to have been badly burned about the face, and particularly the eyes, but beyond that and the shock he was apparently uninjured.

AN old workman named Alfred Crowther, while repairing the roof of the Rev. R. J. Campbell's church in Queen Square, Brighton, last week fell some 20 feet to the ground. He was picked up unconscious, and on being taken to the hospital was found to have sustained injuries to his chest and ribs, necessitating his detention.

THE School Board are about to erect schools in Earle Road, Wavertree, for the requirements of the district, and the provision of a public clock in the building has been suggested. The site is in the centre of a very large area which is at present without a public timepiece nearer than the Picton clock or Edgehill Church. Colonel Morrison, vice-chairman of the Board, has interested himself in the matter, and it is

to be brought before the building and sites committee at the next meeting.

THE scheme to extend Leith Hospital in commemoration of the Queen's Diamond Jubilee is likely to take practical shape in the course of a few months. The directors of the hospital have now matured a scheme to meet the views of the commemoration scheme committee. The extension is to take the form of an addition to the King Street pavilion, whereby the wards in the south end will be incorporated into the new building, and the present ward of six beds on each flat will be made wards of twenty beds. Day-rooms, bath and lavatory accommodation and lifts will be provided at the ends of the wards. The present north wards will be utilised for the administrative offices, doctors' and nurses'-rooms, kitchen, &c., of the new wards. The extension will allow of an increase of twenty-seven beds in the King Street pavilion, and on completion the hospital will contain in all 102 beds, besides three isolation-rooms. The elevation of the building shows a frontage to King Street on the lines of the existing elevation to that street, but it is treated in a less severe style, and terminates with an ornamental gable and oriel window, with balustrading. For some time past the kitchen and laundry accommodation and nurses'-rooms have been found insufficient for the requirements of the hospital, and the need for new buildings for these purposes has also occupied the attention of the board of directors. The proposal to increase the number of beds has brought the question to a point, as without such isolated administrative accommodation the extension proposed could not be utilised. The kitchen was originally constructed for a hospital of forty beds. Fortunately, the directors secured, a few years ago, ground on the other side of King Street, opposite the hospital, more with a view to preserving the amenity of the buildings than for extension purposes, but the ground has been found to be of value, and it is now proposed to erect on it a new kitchen, laundry and nurses' home. Plant for steam-power will be put down for the kitchen and laundry, and it is intended to provide an installation of the electric light and motive power for lifts, &c. The nurses' home will provide accommodation for nearly thirty nurses. The buildings will be connected with the hospital by a subway under King Street, permission to construct which has been granted by the Town Council. The total cost of the new buildings, including machinery and plant, is estimated at between 17,000*l.* and 20,000*l.* The plans have been prepared by Mr. W. N. Thomson, architect, Leith.

TRADE NOTES.

THE new Board schools, Ferrybridge, are being warmed and ventilated by means of Shorland's patent Manchester grates.

IN the ventilation of the Cunningham Memorial Free Church, Glasgow, now in course of erection (Messrs. H. & D. Barclay, architects), Cousland's "Improved Climax" patent direct-acting invisible roof ventilators are being used, supplied by the Climax Ventilating and Heating Company, 93 Hope Street, Glasgow.

THE following buildings are being ventilated throughout on the "Grahtryx" system of ventilation by the well-known firm of ventilating and heating engineers, the Grahtryx Ventilating and Engineering Company, Limited (successors to Baird, Thompson and Co., Limited), 23 Sutterton Street, Caledonian Road, London, N., and at Glasgow. The new schools, Blackford, Wedmore, near Weston-super-Mare; Emmanuel Church, Little Drayton; Penygroes Congregational Chapel; and Muswell Hill Congregation Church.

THE public hall which Lord Pirbright is generously erecting at Pirbright for the use and recreation of the inhabitants will stand in the centre of the village, adjoining the fountain which he gave in commemoration of Her Majesty's Jubilee. The hall will be erected in red brick, and will measure 60 feet by 30 feet, and 22 feet in height. It will be panelled in oak, and the flooring will be of the same wood. There will be a sliding partition in the centre, making two square rooms when the entire hall is not required. There will also be two smaller rooms, measuring 15 feet by 10 feet each, one to be fitted with a cooking-range, the other with a lavatory.

FIRE AT THE WORKS OF THE ANAGLYPTA CO., DARWEN, LANCASHIRE.

The door we fitted in these works, although subjected to a heat intense enough to melt brass taps and fittings near it, withstood the heat perfectly, and can now be inspected at our works in Manchester, fit for duty. The metal sheets have expanded without becoming detached, whilst the wood is simply charred to a depth of about ⅛ of an inch.

FULL PARTICULARS AND ESTIMATES FREE

VARIETIES.

A KURSAAL on the continental plan is to be erected at Folkestone. It will be built in a sheltered position under the cliffs, with a road leading down from the famous Leas.

THE building operations at Hertford House are fast approaching completion owing to the mild winter and absence of frost, and it is hoped that most of the Wallace collection bequeathed to the nation will be on view this summer.

THE new Union Infirmary at Wakefield was opened on the 19th inst. The building, which also includes a laundry, adjoins the workhouse. It has been fitted with all the latest improvements, and the estimated cost is 37,000*l.*

AT the monthly meeting of the Mytholmroyd Urban Council it was resolved to apply to the Local Government Board for powers to borrow 12,423*l.* for the carrying out of the proposed sewerage scheme. This does not include the cost of the outfall works.

THE new bridge (erected on the site of an older structure), which spans the Don at the bottom of Marchgate, and connects Doncaster with the country, was opened on the 19th inst. The new bridge is 12 feet wider than the old one, and the watercourse has been increased by one-third.

THE Queen is to visit Ryde for the purpose of formally opening the new Diamond Jubilee Wing of the Isle of Wight County Hospital on Wednesday, February 8. Her Majesty will be accompanied by Princess Beatrice and by the members of the household in waiting.

INVERUGIE CASTLE, Peterhead, the home of the Earls Marischal, and one of the old historic ruins of Scotland, has had to be pulled down, it having been rendered dangerous by the recent storm. The structure dates as far back as 1380, and part of it was even of earlier origin.

ANOTHER misfortune has befallen the parish church of St. Nicholas, Strood. At Christmas the tower was burned out and the turret and bells destroyed. During the recent gale, in the early morning, a portion of the tower was blown down. A heavy piece of masonry crashed through the roof and fell on the floor of the church, narrowly missing the font.

THE second portion of the scheme for the interior decoration of St. Andrew's parish church, Halstead, Essex, has just been completed. The north chancel wall has been painted and decorated with an elaborate diaper and appropriate texts; also a large-sized painting of a figure of David, standing under a canopy in the fifteenth-century style. The south wall has been treated in a corresponding manner. The fine oak roof has been partially gilded, and the chancel arch has been redecorated with elaborate monograms and emblems of the patron saint.

THE new bridge erected over the Cart at Millbrae, between Glasgow and the district of Newlands, at a cost of 4,353*l.*, by the Corporation of Glasgow and the County Council of Renfrewshire jointly, was opened on the 20th inst. for traffic. The bridge is of one span, of Locharbriggs sandstone, with the facing of the arch and the parapets in grey granite, and a width between the parapets of 50 feet.

IT is intended to construct a tunnel through the Quirinal, Rome, a measure which is shortly to be accomplished under the all-embracing formula of municipal improvement. The Quirinal Tunnel is to be about 20 yards wide, and will serve as a thoroughfare for pedestrians, carriages and a new electric tram line. The execution of the work will, it is estimated, take some seven months to accomplish, and the municipality of Rome will place it in the hands of private contract. The Quirinal Tunnel is not to be a horizontal cutting; it will have an ascent through the Quirinal Hill to the higher ground of the Viminal and the Esquiline, uniting by tramroad and footpath the higher parts of Rome with the town districts lying in the plain. The new Quirinal electric tramway will start from outside to Porta del Popolo to the north of the Imperial City and end at the Porta San Giovanni in the south.

HOUSE REMOVALS IN AMERICA.

AN extraordinary piece of house-moving was successfully carried out in New York a few days ago, says the *American Architect*. In consequence of the widening of a street it was necessary to remove a block of four five-storey brick houses. The street was to be increased in width 40 feet on each side, and the most available new lot to set the houses on was at some little distance, so that it was necessary to transport them 115 feet; but the only alternative was to pull them down entirely, and as they cost 64,000 dols. to build, the owner decided to take the risk of trying to move them. Under the direction of a clever architect, a plan was devised for transferring them on greased ways, instead of the usual rollers, and the scheme was carried out with complete success. The first step was to insert 375 jack-screws successively in

openings made for the purpose in the foundation walls. By means of the jack-screws the whole block was then raised 4 feet, and the ways, of heavy timber, well lubricated with soap, were placed beneath, and the houses lowered upon them. As soon as the weight rested firmly on the ways the jack-screws were taken out and applied to pushing the building laterally. In this way the block was pushed back 40 feet. The ways were then shifted to a position at right angles with their former direction, and the houses pushed 75 feet in the new direction, until they reached the new foundations which had already been built to receive them. It was then an easy task to lower the block on the new foundation walls, reconnect pipes and flues, and make the houses ready for occupancy. It is said that the work was done without causing a single crack in any of the houses, and, as the cost of the whole operation was only 10,000 dols., a considerable sum of money was saved. Although the celebrated moving of the seashore hotel on Long Island by means of a gang of locomotives was a more picturesque performance, it was hardly so serious as that of shifting a block of brick houses, and the operation attracted much attention. The inspector of buildings actually concluded that the experiment was too hazardous to be allowed, and ordered the work stopped before the moving had fairly begun, but an appeal was taken from his decision to the Supreme Court, and after six weeks' delay the Court reversed the inspector's action.

INLAND NAVIGATION IN ENGLAND.*

IN all the countries which have been considered a considerable inland navigation traffic exists, but the large traffic is confined to certain waterways suitably situated for securing a large traffic in bulky goods. Also in all these countries, with the exception of England, after a period of indifference on the advent of railways, strenuous efforts have been made in recent years to improve, render uniform, and complete the main waterways of the country, thereby securing a benefit to the trade of the country, providing a useful automatic check on the railway rates, and serving to relieve the railways of somewhat burden some traffic.

* From the paper read by Mr. L. F. Vernon-Harcourt, C.E., at the meeting of the Society of Arts on the 18th.

In the early days of canal enterprise, the waterways of a country formed the chief routes of economical carriage, but on the introduction of railways the scope of waterways became necessarily restricted. Where the population is scattered and there is an absence of minerals or manufactures of bulky goods, and especially where the country is also somewhat rugged, a railway which can follow more nearly the irregularities of the surface, by gradients in place of level reaches, and can adopt a more direct course, serves more suitably the requirements of the district, and has better prospects of a return on the expenditure. Old waterways in such situations might advantageously be maintained, at a moderate cost, to serve the immediate district they traverse; but a large improvement of such waterways would not be economically justifiable.

In the present day, in face of the competition of railways, the primary requirement for a waterway is the existence of bulky goods which it may convey to large towns, or from inland mining or manufacturing centres to a seaport. Without such traffic a very commodious waterway will languish; whereas with minerals or bulky manufactures even a waterway of very inadequate width and depth may maintain a good traffic, as evidenced by the Birmingham, the Leeds and Liverpool, and other English canals. The second requisite to enable a waterway to compete successfully with railways and enlarge its traffic is uniformity of dimensions along the whole course of its main line, with a good depth and width and ample size of locks, so as to afford a passage for large barges, and expedite their transit. Great differences of level on a waterway are prejudicial to its prospects of traffic; for not only do such conditions greatly increase the cost of first construction and subsequent enlargement, but unless inclines are adopted, or costly hydraulic lifts, there is a great delay in the passage through flights of locks and a large expenditure of water. Canals, under these circumstances, which might be expected to form useful links between important navigations, fail to attract trade—such, for instance, as the Ludwig Canal, connecting the Rhine and the Danube; whilst a second-class waterway, with a more moderate summit-level, may be preferred to a first-class waterway, as in the case of the Loire lateral Canal, which secures the greater part of the traffic between the Saône and the Seine, though there is a shorter and larger waterway by the Bourgogne Canal. Every improvement in the main waterways of Germany has been accompanied by a large increase in traffic; and the enlargement, extension and progress towards uniformity of

the main lines in France and Belgium has been attended by a remarkable growth of traffic.

The experience gained from a review of the traffic returns of all the countries for which such statistics are available shows that the improvement and unification of dimensions of English waterways should be confined to those waterways included within the zone of the mining and manufacturing centres, or leading from them to the Mersey, the Humber, the Thames and the Severn. These waterways should form the subject of a careful and thorough inquiry, in order that the improvements needed, their extent and their cost may be accurately ascertained as portions in each case of a complete scheme. England does not possess the magnificent natural waterways of North America, the large rivers of Germany, or even opportunities for such long artificial waterways as France; but it possesses in an eminent degree the requisite traffic, within a limited region, in bulky goods, which even the neglect of about three-quarters of a century has not sufficed to drive away from its antiquated waterways; and it is evident that the enlargement of these waterways, if feasible within reasonable limits of expenditure, would even at this late period, judging by the experience of the Weaver, the Aire and Calder, and the principal waterways of Europe, be attended by most satisfactory results to the waterways themselves, the trade of the country and the population in general. If the future water-supply of London is considered of sufficient importance to engross the attention of two Royal Commissions, it cannot be too much to ask that a Commission may be appointed to hold an inquiry on the best means of promoting inland navigation in the industrial centres of England, a subject which has been considered worthy of the cordial support of the Governments in the other foremost countries of the world, and which has an important bearing on the trade of the country and the general prosperity of the community. In the meantime, considering that the statistics of the canals and navigations of the United Kingdom are already ten years old, are acknowledged to be incomplete, and do not afford any indication of the distribution of the traffic on the several waterways, the Board of Trade might be urged to collect a fresh set of complete statistics to assist the labours of the proposed Commission, to indicate the growth or decrease of traffic on the waterways since 1888, and to afford suitable statistics as to the distribution of traffic on the waterways, as furnished by the Governments of the United States, Germany, France and Belgium. Ways of communication are to a country like the arteries to the body; and the waterways which affect the central and most flourishing and industrial portion of England cannot, any more than the arteries near the heart, be suffered with impunity to be paralysed by neglect.

LEEDS BUILDERS' EXCHANGE CLUB.

THE seventh annual meeting of the Leeds Builders' Exchange Club was held on Wednesday evening, in the club rooms, Boar Lane. Mr. S. Blunt presided over a numerous gathering of members. The report contained the following:—"The finances of the club are still far from satisfactory. The fault lies not with the merchants connected with the club, who do their utmost for the welfare of the building trade in Leeds, but with the builders themselves, for whom your committee have done so much good. Anything appertaining to the building trade has been taken up by them in earnest, and they therefore ask for the support of every builder. During the year the Yorkshire Building Trades Federation has been put on a firm basis, and a branch has been formed in Leeds. The whole of the members of the club had been enrolled, and their subscriptions paid out of the funds of the club. All builders or builders' merchants who now became members of this club will be enrolled as members of the Federation, without additional cost of subscription. The objects of the Federation are well known by every business man, and the builders of Leeds will be able to appreciate the labours of the executive of the Federation in case of any unreasonable demands being made upon them by the various unions of workmen, or in case of a strike." There was a lengthy discussion on the report. Mr. W. Nicholson expressed the hope that the committee would be strengthened, and the club and its finances conducted in a more business-like spirit. He urged that the speculative builders should support the club better than they appeared to do. His desire was the welfare of the club and the trade, and the speculative builder was likely to be in a position during the present year to appreciate the benefit that combination would confer.

The chairman, replying to a question by Mr. Nicholson, said that, so far as his memory served him, they were not losing members to any considerable extent, and as a matter of fact the receipts during the past year had been greater than in 1897. The committee would be glad of guidance and assistance, and would welcome the co-operation of the Master Builders' Association.

Size No. 8. Diameter ¼-in.
Will outwear a hollow-braided line twice its diameter.

TOO LITTLE ATTENTION is paid to the quality of Sash lines. The rough hollow-braided cords generally used are not durable and do not run smoothly. ***THE SAMSON SOLID BRAIDED SASH LINE*** has ***TENFOLD*** the durability and smoothness, ***at practically the same price.***

STANLEY BROS. Ltd., NUNEATON.

It was urged during further conversation that it was extremely important to get better premises for the club—premises which would afford them a good commercial room and committee-rooms for each section of the trade. It was also pointed out that in matters connected with the building by-laws the committee had done good work for the speculative builders. The report and balance-sheet were adopted.

The officers were then appointed as follows:—President, Mr. Wm. Bower; vice-presidents, Messrs. C. F. Wilkinson, W. H. Vickers, J. Matthews, George Burnell, and J. Wilby; committee, Messrs. E. Umpleby, W. Lolley, I. Rishworth, J. N. Smith, A. Wheater, A. Lambert, and W. Nicholson; treasurer, Mr. Arthur Mountain; secretary, Mr. J. Jackson; and auditor, Mr. F. A. Holdsworth, chartered accountant.

THE CARPENTERS' COMPANY.

A COURSE of lectures on matters connected with building will be given at Carpenters' Hall, London Wall, on Monday next and the four succeeding Mondays, at 8 o'clock. On January 30 the lecturer will be Mr. J. Mansergh, and the subject "The Bringing of Water to Birmingham from the Welsh Mountains." The Master of the Carpenters' Company will preside. On February 6, when Cardinal Vaughan will take the chair, Professor Banister Fletcher will lecture on "Ornament." On the 13th, under the presidency of Sir Arthur Arnold, Mr. Basil Mott will describe the building of an underground railway. On the 20th Professor Roger Smith will speak on "Terra-cotta, its Nature, History and Use." Mr. Walter Crane will preside. On the 27th Mr. William Poel, director of the Elizabethan Stage Society, will lecture on "English Playhouses in the Sixteenth, Seventeenth and Eighteenth Centuries" Sir Squire Bancroft will be the chairman. Each lecture will have lantern illustrations. Admission can be obtained gratuitously by ticket to be obtained at Carpenters' Hall.

SHREWSBURY AND DISTRICT MASTER BUILDERS' DINNER.

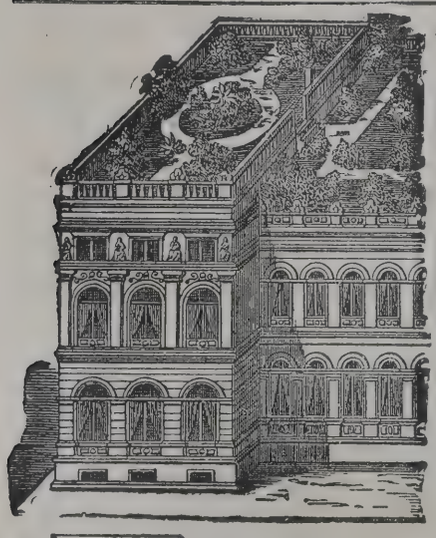
THE annual dinner of the Shrewsbury and District Master Builders' Association was held at the Lion Hotel, Shrewsbury, on Wednesday evening. The President, Mr. W. T. Williams, was in the chair, and the Vice-President, Mr. H. Price, in the vice-chair. Supporting the President were Alderman Blockley and Councillors J. Gethin and H. Farmer.

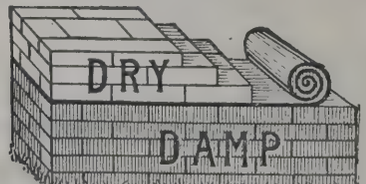
After the dinner the President proposed the loyal toasts, which were duly honoured, and Alderman Blockley proposed the health of the President and Vice-President, to which those gentlemen responded.

The toast of "The Visitors" was proposed by the Vice-Chairman, and responded to by Mr. H. Payne, Baschurch.

Mr. Rhys proposed "Success to the Shrewsbury Master Builders' Association."

The President, in reply, said though the Association had been in existence for a number of years, it was still practically in its infancy. They all knew the troubles and trials they had to contend with from their workmen, though he did not wish to say a word against their employés. The masters, however, had had some very hard battles to fight, and they could only win their battles by sticking together. They had had in that a great lesson from the recent strike of engineers. In some towns the master builders had to put up with great tyranny from the men, and were therefore bound to do something to protect themselves and the interests of their customers. Their erring brothers, he hoped, would come into the fold, and so help in securing fair play. As masters, they were quite willing to pay the men fair wages, and all they wanted in return was fair treatment. He considered their Association was deeply indebted to their secretary, Mr. C. E. Morris; for its present high position was in a great measure due to his exertions.





Mr. H. Mudd proposed the health of the hostess, and Mr. Jones, on Miss Rudkin's behalf, responded.

During the evening songs were contributed by Messrs. Charles Jones, R. Price, Alf. Morris, H. Mudd, Rhys and Harris. Messrs. F. J. Rowlands and Allen were the accompanists.

STREET HOARDINGS.

THE attention of the works and general purposes committee of the Vestry of St. Margaret and St. John, Westminster, having been called to the risks to which the public have been exposed during the recent high winds by reason of the excessive height to which hoardings upon the public highway are carried, the committee will bring the matter before the Vestry at its meeting on Wednesday. In their report on the subject the committee state that several cases have been brought to their notice in

PATENT
VULCANITE ROOFING

Since the introduction of the patent Vulcanite Roofing into this country it has been adopt by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospita Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and sumn than under any other roof. When properly laid repairs are never required, and all roofs guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGE TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower a quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 sup ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

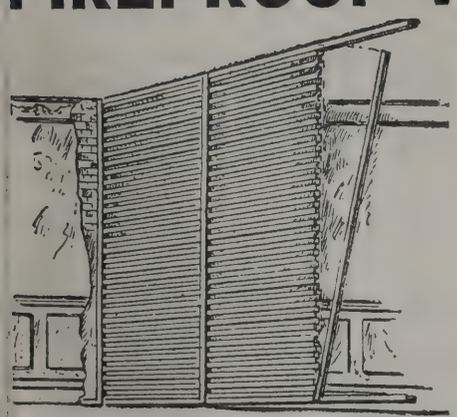
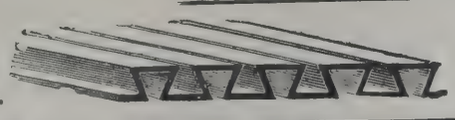
which hoardings were brought down and the débris carried about the public highway by the gale on the 12th inst. The licenses issued by the surveyor in certain of these cases properly limit the height, but the committee say they are informed that the limits prescribed are frequently disregarded by the licensees. They will submit a recommendation to the effect that it be a standing order of the Vestry that no hoarding upon or over the public highway be sanctioned under any circumstances of a greater height than 12 feet without the previous sanction of the works committee; that every hoarding be required to be surmounted by a sufficient "fan," of such width and at such angle as will insure the public safety, and that proceedings be forthwith taken against licensees in all cases of infringement of conditions and regulations upon which the licenses are granted.

THE DISPUTE IN THE BUILDING TRADE.

THE lapse of a few days has effected nothing in the way of improving the position in the building trade, writes a special correspondent of the *Times*, although it is, no doubt, true that the public realises more thoroughly than hitherto the main facts with which the employers of the eight classes of men employed in the building trade have long been sorrowfully familiar. It is now admitted and well known that the plasterers at the three establishments selected as fields of battle struck simply because their employers would not compel their foremen to become members of the National Association of Operative Plasterers. It is also notorious that this body, which will be called for the future the Plasterers' Union—the phrase is short and the word "operative" is likely to be inapplicable very soon—is a fiercely aggressive union addicted to narrow restriction of apprentices and audacious enough to fine employers who break union rules which they have had no share in enacting. It is also known that this strike, which was declared by the union officials, or some of them, is reprobated by those persons who are, as a rule, thick and thin supporters of strikers, and that the officials are said to have been forced into action against their wishes by their followers. If this be so, then, as the attempt to inaugurate a piecemeal campaign calls to mind the opening of the engineering dispute, so these leaders who ask against their better judgment for that which they think there is no chance of getting occupy in January 1899, and in London, much the same position which Mr. William Abraham, M.P., and his colleague occupied in March 1898 Meanwhile it is certain that no step has been taken in the direction of peace or conciliation by the officials of the men's union.





But the employers have not been idle. The battle has been forced upon them as clearly as battle has ever been forced upon any employers, and, as becomes prudent men, they are arming themselves and collecting a special war fund. I say "war," because there is no manner of sense in mincing words or in talking of peace where, to all appearance, there is no peace. The master builders and other employers of plasterers in the metropolitan district held a private meeting at St. Martin's Town Hall on Tuesday. I was not present at that meeting, but I am able to give some account of the proceedings. The meeting was largely attended, it was enthusiastic in tone, and its tone was that of men convinced that firm resistance to aggression was imperative as a measure of self-defence. Moreover, it was a meeting thoroughly representative of the substantial firms engaged in the metropolitan building trade. The persons present agreed by unanimous resolution to adopt and carry into effect at the earliest possible moment the policy pursued by the Central Association of Master Builders in London. That policy, as has been stated before, is to lock out all the members of the Plasterers' Union in London first, and probably in the country later, unless the union is prepared, not only to drop absolutely the preposterous demand that the foremen shall be enrolled on its list, but also to relinquish sundry other pretensions which, to one who is not a plasterer, seem outrageous. It is quite likely also that there may be other trouble, for there is news of murmuring among the carpenters, and the bricklayers, with their restrictions upon the amount of work a man may do in a given time, run the plasterers hard in point of aggressive tendency.

Also, it is to be observed, the master builders and others opened a large special fund on the spot, and subscriptions came in at Tuesday's meeting with a rapidity which demonstrated the mood they were in. The pocket is less readily stirred than are the emotions, and the rapid growth of that special fund is significant. They mean business; but they will not act precipitately. "The earliest possible moment" would be one hour after work should begin; but the lock-out will certainly not begin until after the National Association of Master Builders has met on January 31. There appears to be no probability that the National Association will disapprove of the policy of the metropolitan builders. Rather is the

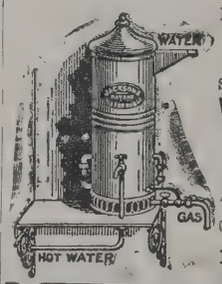
contrary probable, for the provincial builders suffer more severely, if possible, than their brethren in London from the tyranny of the unions, of which the plasterers' is the worst. A decision to lock out plasterers all over the country is the most likely outcome of the meeting of the 31st, unless things change much in the interval. Nor can the situation be described as hopeful. But there is a ray of hope, or at any rate a possible path towards peace. In the spring of 1896 the Master Builders' Association had a tussle with all the unions. At the end of May a deputation of provincial tradesmen (in the Scotch sense of the word) visited London. A ballot was taken. The carpenters and joiners came to terms with the employers; the bricklayers followed suit. The plasterers, who were said to be in a "truculent mood" when the other trades had agreed to a *modus vivendi*, had to yield at last and the strike ended. The point is that provincial influence was exercised in favour of peace. It is at least permissible to hope that it may be exercised in the same direction again, and that some 8,000 men in the provinces—I divide the 13,000 plasterers roughly—objecting to be locked out, as they are likely to be, may succeed in persuading the London plasterers that their claims are untenable, and that, by persisting in them, they will impair not only their own position, but also that of others. Thus, a second time, provincial common-sense may come to the rescue of metropolitan hot-headedness.

THE LONDON WORKS DEPARTMENT.

AT the meeting of the London County Council on Tuesday the finance committee presented the half-yearly statements of works executed by the Works Department up to September 30. They showed a balance of loss of 21,000*l.* on the twelve estimated works reported upon. Of these works four were commenced before the reconstruction of the department in February 1897, and they exhibited a balance of loss of 24,720*l.* On the remaining eight works, which were commenced under the present management, there was a saving or balance of cost below estimate of 3,720*l.* The chief loss, amounting to 22,924*l.*, was made on one work—the construction of the Lewisham sewer.

Mr. White said that since its commencement the department had made a loss of between 40,000*l.* and 50,000*l.* The question now was, were they going on losing money at the same rate or at an increasing rate? There was a loss of 22,000*l.* on the Lewisham sewer. That loss was not made on the cost of materials, but in wages and charges, and he should like to suggest that the workmen were lax in the way they discharged their duties to the Council. The Council were a good deal to blame for that, because when they initiated the Works Department they clearly gave the workmen to understand that they would not be required to exert themselves or put themselves about very seriously, and that the Council were going to improve the conditions of labour by requiring less work from the men than was the case with the ordinary employer. Had the Lewisham sewer gone to a contractor they would certainly have got it executed within contract price. A number of works which had been refused by the department had subsequently been carried out by contractors for less than the engineer's estimate. Only a short time ago an expert had been employed to report on the comparative quality of the work done by the Council and that done by contractors. That expert had reported in regard to selected works, that as far as brickwork was concerned there was nothing to choose between the two, but that the joinery work of the department was distinctly inferior to that of contractors, and that in regard to certain work carried out by the Council at Colney Hatch Asylum, on which there was a loss of 5,000*l.*, it was the worst work he had ever seen.

Mr. John Burns, M.P., said that one reason for the loss on the Lewisham sewer was that the work was originally taken by the department at too low a price. Mr. White forgot to tell the Council that the loss on the Lewisham sewer took place at the time when the department was in a state of utter anarchy. In the case of the Clerkenwell Fire Station the estimate was 6,200*l.*, and the contractor's bill was just coming in for 11,089*l.* He (Mr. Burns) complained of the money spent in the department on what he thought was needless supervision of works. If they had a manager with 1,500*l.* a year, surely he ought to be entrusted to carry out the works without a crowd of clerks about him. This over-supervision had been the cause of the men doing less work than they otherwise might have done, because they had felt that if the Council could afford three or four clerks of works on small jobs they were rich enough to allow them to do less work or to be longer over it.



Mr. Cohen, M.P., said the management of the department by the finance committee was little less than a deception. What he desired was to put an end to the present method of control, which from its beginning had been nothing less than a lamentable and crass failure.

VOLUME LX. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered, price 12*s.* 6*d.*
Office: 175 Strand London.

Dr. Collins said he always thought that they were using ords very idly in speaking of profit and loss in connection ith the works carried out by the department. It might seem aradoxical, but the real test of the value of the Works Depart-ient was one which could never be applied, namely, what ould have been the cost of carrying out the works by con-actors if the Council had not possessed the means of stepping , when it knew that inflated tenders were going to be sent in, nd saying, "We will do the works ourselves."

Mr. Ward pointed out that in regard to jobbing works the epartment had all along shown a profit, and in regard to the ther works there were more favourable conditions apparent r the future, and he thought it probable that the department ould be able to make considerable profits.

Lord Welby (chairman of the finance committee) said that Ir. White had mixed up the results of the department under ie old and the new management. He might call attention to ne single figure illustrative of the manner in which the new anagement carried on its work. On works estimated to cost 2,000*l.* the actual expenditure had been 33,000*l.*, showing a aving of 9,000*l.* That was a significant indication of the anner in which the department was now carrying on its usiness. In the case of the Lewisham sewer the amount of ie deficit chargeable to the new management was very small, mounting to only between 2,000*l.* and 3,000*l.* Even if they ent further back and examined the whole management of the epartment, the expenditure of something like 750,000*l.* ex-eeded the estimate only by something like 40,000*l.* Upon the hole range of work the expenditure had exceeded the estimates y only about 5 per cent. He admitted that the establishment harges were high, but he hoped to lay before the Council esults which would convince members that they were not nfair.

The statements were received and adopted, and excess votes o cover the losses shown were agreed to.

THE LABOUR PROTECTION ASSOCIATION.

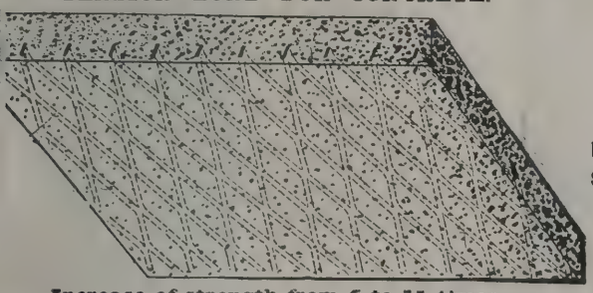
HIS Association, which has for its principal objects—

"1. To test systematically the efficiency or otherwise of the existing laws for the protection of workmen, and, if necessary, to obtain an amendment of such laws;

"2. To watch all strikes, and insure the observance of the law in all disputes between employer and employed; and

"3. To oppose all legislation injuriously affecting the trades and industries of the United Kingdom,"

has just issued its report for 1898. The name of the Association has hitherto been the "Free Labour Protection Association," but to obviate the confusion existing in some quarters with regard to its constitution and objects, it has been decided to adopt and use henceforth the name "Labour Protection Association," dropping the word "Free."



A full account is given of the strikes and labour disputes in regard to which the Association took action during the year. The principal of these was a strike of porters, shunters, signalmen and permanent-way men on the Cork, Bandon and South Coast Railway, which took place in January of last year. Application was made to the Association, and men were at once obtained and despatched to Ireland in charge of "emergency men." The report calls attention to the outrages of various kinds which accompanied this strike, including the attempt to wreck a train and the brutal assault upon a party of military recruits who were supposed to be "blacklegs" from London. After being out for some months the men gave way, and those for whom there were vacancies returned to work on the old terms.

The Association also provided workmen and "emergency men" in connection with a colliery strike at Shirebrook in Nottinghamshire, the bone brush makers' strike in London, moulders' strikes at Mansfield and Clerkenwell, a strike of tailors at Limerick, and a number of smaller disputes.

A large amount of Parliamentary work was done during the Session. A summary of "Objections" to the Mines (Eight Hours), Workmen's Houses Tenure, and other Bills injuriously affecting trade and industry was sent to members of Parliament and the press, and, by the assistance of several members of Parliament, the Bills were "blocked" on every occasion they appeared on the Orders of the Day, with the result that not a single one of the measures made any progress.

A most important step was taken by the Council of the Association in calling a meeting of representatives of all the industries of the country with a view to the formation of a Parliamentary Council for the purpose of opposing or amending any Bills injuriously affecting the interests of trade, or which seek to violate the principles of free contract or free labour. As a result of the meeting, which was held on November 15, the Employers' Parliamentary Council—a body now entirely

THE PROBLEM SOLVED.
ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.
HE BRITISH NON-FLAMMABLE WOOD COMPANY, LTD., who have recently introduced into Europe the process now being so largely used in America, have erected large works in this country, and are now taking orders for the supply of their NON-MMABLE WOOD. The whole of the Carpentry and Joinery in the following notable buildings in New York, amongst others, consists of -FLAMMABLE WOOD:—The COMMERCIAL CABLE BUILDING, The QUEEN'S INSURANCE BUILDING, and the R. G. DUNN BUILDING.
NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large orders have been given by H.M. Government.

ndependent of the Labour Protection Association—has been formed, and arrangements have been made for carrying on the work which this new body has undertaken.

Attention is called to the change of feeling both on the part of the public and of the magistrates in regard to intimidation during trade disputes, which is attributed in great measure to the wide circulation of literature by the Association and to the Association's action in counter-picketing pickets. The report concludes with a strong protest against the charge of "union-smashing," and reference is made to the opinion of Mr. James Mawdsley, the well-known representative of the textile workers of Lancashire, who wrote in the public Press in September 1897 that the Association expresses "no intention of any description other than that of doing work which is well known appertains to all employers' associations." In conclusion, attention is called to the fact that the chairman of the Association (the Earl of Wemyss) was himself a member of the Trade Union Commission which reported in favour of the legalisation of trade unions. This should be a sufficient guarantee that an Association of which he is the head will not embark on a "union-smashing" policy.

BACK-TO-BACK HOUSES.

THE town clerk of Leeds (Mr. Jno. Harrison) has received a lengthy communication from the Local Government Board refusing to sanction the erection by the Corporation of back-to-back houses in the York Street insanitary area. This decision, says the *Leeds Mercury*, comes as a great surprise, as the deputation who recently waited upon the Board's representatives in London returned to Leeds feeling confident they had made out such a strong case that the Local Government Board would make an exception in their favour and grant their request. But the Local Government Board have preferred, it seems, to stick to their general rule and prohibit such structures. The matter, it will be remembered, has reference to the clearing of the York Street insanitary area. In that part of the city the Corporation have received permission to demolish property which now provides shelter for 3,800 people on condition they provide new and conveniently situated dwellings to accommodate 2,000 of the displaced tenants. The sanitary committee, after lengthy deliberation, came to the conclusion that through houses could not be built to let at anything like the small rental the displaced tenants have been in the habit of paying. Further, they objected to the construction of flats, as they thought such premises were too much like barracks and too little like homes. They felt they had but one course left, namely, to provide the accommodation required by the erection of well-ventilated back-to-back houses. The Local Government Board's decision naturally places the committee in a dilemma. The expense of building through houses would be considerably beyond their anticipated expenditure on the scheme, even if they could obtain the necessary land for their requirements, which is doubtful. Their only way out of the difficulty seems to be the provision of flats. The deputation who recently inspected such structures at Glasgow came away with a very poor opinion of them. The resources of architecture, however, are by no means exhausted, and possibly some more acceptable dwellings may be devised than those at Glasgow.

THE MANCHESTER INFIRMARY.

ON Monday Mr. F. Brocklehurst, one of the representatives of Harpurhey Ward in the Manchester City Council, addressed a meeting of his constituents. He said the question of the Infirmary site was a very important one, and a crisis had been reached in the history of the negotiations. He moved, "That, subject to the acquisiton of the Infirmary site at a reasonable price, this meeting of the electors of Harpurhey endorses the scheme propounded by Councillor Brocklehurst, whereby the Infirmary will be placed in healthier surroundings, the hospital work in Manchester perfected and simplified, and the literary and artistic needs of the community met and supplied." He contended that it was one of his most important duties as a public representative to awaken the keenest possible interest in all that concerned the affairs of the city, whether commercial, or literary, or artistic, or the back-door drains, or sewage, or the provision of newspapers or light. As negotiations had to be continued with regard to the purchase of the Infirmary site, he wished to avoid the possibility of creating friction in the matter. He submitted that the basis of the reopened negotiations was on the lines he suggested last May. He was glad to see the scheme had received so much public support, and believed it would receive increased support. It involved the transference of the Infirmary from the present site. He considered they had the opportunity of a century to carry out a much-needed hospital reform. There was great confusion in the public mind as to

where and when to go to the out-patients' departments connected with the various hospitals. By the transfer of the Infirmary from its present position, the sale of the site and the consequent acquisition of funds provided a most excellent opportunity for correlating all these scattered out-patient departments, bringing them under one roof, where all manner of diseases might be treated on every day of the week, and forming an institution that would, as it were, be known as a medical clearing-house for the whole of the Manchester poor. He did not say it should supplant the hospitals for special complaints. The public money was not spent as wisely as it would be if it were spent to pay the rent of this large central building. He did not suggest that the out-patients' building should be erected on the Infirmary site, though he did not think it would be too large, but he was anxious it should be in the centre of the city. If the clearing-house was erected on the Infirmary site the Infirmary authorities would be without any source of income for building their new Infirmary, and would have to appeal to the public. The sale to the Corporation would provide them with more than enough to build a palatial Infirmary on the outskirts of the city, and at the same time it gave to Manchester an opportunity which it had never had before of putting up a decent building where it might be seen. He admitted it was largely a question of cost, and it might amount to three-quarters of a million or a million sterling. He did not wish to forestall the negotiations, but he would point out that this was a great public question between two public authorities. They were two sets of trustees, neither of which had a selfish interest in obtaining or giving more than was necessary. Neither of these bodies in his judgment ought to make a profit at the expense of the rates. He believed he voiced the wishes of many people in saying that a desire existed that the Infirmary authorities should in regard to the price of the site deal if anything generously with the Corporation. They were not hampered for funds. They had money in hand, and they had a site offered in Stanley Grove on which to build a new Infirmary, and therefore would not have to spend money on the acquisition of a new site. They would require money to erect the new building, to arrange the out-patients' department and the accidents and emergency ward, and so long as these things were secured the Infirmary authorities would not in his judgment be traitors to the future if they accepted a sum which would enable them to carry out those projects with ease. And yet on the most favourable computation, granted that the site was obtained for a reasonable price, there was a great problem to be faced and a considerable burden to be put upon the rates. It was for them to say whether they were prepared to make the sacrifice. If they were not, the movement, so far as he was concerned, was at an end.

The resolution having been withdrawn, the meeting shortly afterwards terminated.

MASTER PLUMBERS' ASSOCIATION.

THE annual dinner of the Glasgow and West of Scotland Master Plumbers' Association was held in the Windsor Hotel, St. Vincent Street, on the 19th inst. The president, Mr. J. T. Renfrew, occupied the chair, and Mr. William Mackie (vice-president) and Mr. J. M. Symington (treasurer) were croupiers. Bailie Dick gave the toast of the evening, "The Master Plumbers' Association," and in the course of an able speech remarked on the importance of the Association as representing the craft in Glasgow and the West of Scotland. The Chairman, in responding to the toast, stated that the Association at present was in an exceedingly flourishing condition; that in the past year no less than twenty-two new members had been added to the roll of membership. He stated that while originally the Association's bounds were confined by the suburbs of Glasgow, it had of late years extended throughout the whole of the West of Scotland, and that there was at the present time a movement on foot to reach the whole of Scotland. Mr. William Rattray afterwards gave "The Lord Provost, Magistrates and Town Councillors," to which ex-Bailie Primrose responded. Parish Councillor Hendry gave "Kindred Associations," and Messrs. Jas. Ferguson (president Master Wrights' Association) and James Goldie (president Master Brickbuilders' Association) replied. An excellent programme of song and story was introduced between the toasts.

COPLAW HILL ELECTRICITY STATION.

AT a meeting of the electricity committee of the Coplaw Corporation there was submitted a report by Mr. W. A. Chamen, the electrical engineer, and Mr. Andrew Myles, the architect of the new generating station at Pollokshaws Road. The report states that the plans, which had already been before

ondon Showrooms—11 BARTLETT'S BUILDINGS, HOLBORN CIRCUS, E.C.

the committee, comprised complete engine-house, boiler-house, coal stores and battery-room, and also sundry offices, workshops, covered-in yard and delivery yard and stores. The roof of the boiler-house was constructed of strong steel girders supported by heavy cast-iron columns, designed for the purpose of carrying large open water-tanks in which the condensers or cooling towers would afterwards be placed, and there were similar columns and girders for carrying the overhead coal tanks. Two chimneys, each 11 feet in diameter inside and 20 feet outside, and 200 feet in height, were also included in the plans. The total cost of all the buildings, including engine foundations, boiler foundations and boiler settings for the whole plant which might ultimately be put into the station, and which would amount to about 15,000 horse-power, would probably be 49,051*l.*; but this estimate did not include the cast-iron tanks over the boiler-house, nor did it include a new line of railway siding which would require to be run from end to end of the buildings, nor certain hoists for coal trucks, sundry rails, coal tanks and appliances for dealing with the fuel supply over the top of the coal stores. These accessories would in all probability cost a further sum of about 10,200*l.*, thus bringing the total for buildings and condensing and coal store facilities up to 59,251*l.* In Mr. Chamen's report, dated April 26, on the proposed extension of works for supplying current within the whole municipal area, a provisional sum of 16,000*l.* was allowed for the first section of the Pollokshaws Road buildings. At that time no plans had been prepared, and it was impossible to say what the ultimate and most advantageous arrangement of the buildings would require to be. It was now evident that the workshops and offices which were included in the present designs, and which were situated at one end of the site, were required very urgently; while, on the other hand, it was necessary that the battery-room and delivery yard, which were situated at the other end of the site, should be got ready with the least possible delay. It was also extremely desirable that the first instalment of engines, boilers and dynamos should be put down near the centre of the buildings for the sake of convenience in extending and for a proper and symmetrical arrangement of plant when the whole was ultimately completed. If the committee decided not to authorise the construction of the whole buildings and coaling facilities now, the following parts of the work might be dispensed with in the meantime:—(1) One of the chimney stalks, except the foundations to ground level; (2) nine sets of double boiler settings; (3) part of the columns and girders to carry water tanks, including two of the tanks themselves, and part of the roof over the boiler-house; and (4) a portion of the concrete of the engine foundations. The items which might thus be left over in the meantime would amount to a reduction of about 14,000*l.*, but if the committee proceeded in this way it would be necessary for them again shortly to give instructions to proceed with the remainder, and this remainder would probably then cost more than if the whole was proceeded with now. In these circumstances Messrs. Chamen and Myles recommended that specifications and schedules for the whole work should be at once prepared and tenders advertised for at the earliest moment. The works would of necessity take some considerable time to complete, say from two to three years, and possibly, judging from the experience connected with the buildings at Port Dundas, even longer; and they did not think that, in view of the enormous and rapidly-growing demand for electric supply, any risk should be run of being further hampered, as the department had been up till now, for want of the necessary buildings. Although the completion of the whole buildings might take from two to three years, sufficient progress might be made to allow of the first portion of the plant being erected, though perhaps under temporary covering, within a period of nine months from the date of acceptance of tenders.

PATENTS.

WALTER E. HEWITT, A.R.I.B.A., Architect.

The Architect.

THE WEEK.

THE death of Mr. HARRY BATES on Monday is a loss to English art which architects can more easily understand than the public in general. He was one of those sculptors in whom there was faith that he would always loyally co-operate with architects in adorning a building with such work as they contemplated. He was in the prime of life, for he was born in 1850. A great many of his years were spent in feeling his way, and his whole career as a sculptor was confined within a term of sixteen years. Twenty years ago he entered the Lambeth school as a student. There, fortunately, he came under the influence of M. DALOU, who was driven to London by his politics. Afterwards HARRY BATES was admitted into the Academy school. He carried off the Gold Medal and Travelling Studentship in 1883 by his *Socrates Teaching*. He spent the greater part of his journey in Paris under M. RODIN. In his studio he executed the three small panels from the Odyssey, which, under the Chantrey Bequest, were at once purchased on their exhibition. As, however, they were not executed in England, the money could not be paid. In succeeding years he exhibited reliefs, for which his skill as a decorator qualified him. But the work he exhibited in 1892—*Hounds in Leash*—demonstrated that he was no less competent to deal with the round. The group gained for him his Associateship. The trustees of the Chantrey Fund compensated for their misadventure by purchasing his *Pandora*. His immense equestrian statue of Lord ROBERTS when placed in the courtyard of Burlington House was a triumph for the sculptor. It will bear comparison with FOLEY'S *Lord Hardinge* and *Sir James Outram*. It was so successful that a commission was given to him for a similar memorial of Lord LANSDOWNE. The pursuit of sculpture is in this country followed with difficulty, and for a man like Mr. BATES it was a victory to make his expenses correspond with his income. In such cases an artist's family can look to the Royal Academy for support, and a stronger claim could hardly be presented than that of the widow and child of HARRY BATES.

THE decision of Mr. PAUL TAYLOR, the magistrate at the Southwark Police Court, will not please metropolitan vestries. The surveyor of roads to the Newington Vestry was summoned because he did not give notice respecting two underground inspection chambers which were constructed in Newington Causeway. The chambers were to be used in connection with the electric light which the Vestry had undertaken to supply. The Building Act says, "That for every building or structure or work about to be begun a notice is to be served on the district surveyor." The question then was whether an inspection chamber came under one of those categories. The Vestry submitted that if notice was required in the two cases in question they would also have to be given for each sewer inspection chamber. The district surveyor replied that there was a difference between the two classes of inspection chambers, and those for which the summons was granted had a roof beneath the footway. The magistrate came to the conclusion that the chambers were included among the building or structure or works of the Building Act, and a nominal penalty was imposed of 1*s*. and 2*s*. costs in each case. He also declined to state a case.

IT is to be hoped the London County Council will endeavour to comply with the request conveyed in the memorial of London architects which was presented at the meeting on Tuesday. Illuminated advertisements are not only a nuisance and degrading to streets, but they are sources of danger to many people. They help to make darkness more intense by the contrast they offer, and people whose eyes are weak become more exposed to the risk of accident from vehicles. While there is no question about their character, it will be allowed that in London, at least, they arise from what must be admitted to be a defect in building. Blocks which are intended to be occupied as offices are, in general, too high. The exteriors may have a grandiose effect, but that does not prevent the upper storeys from remaining without tenants. In residential flats a top floor has advantages which are recognised sufficiently to preserve a tenant from being considered a poor man should he dwell there. But there is no allowance of that kind made for the occupant of a topmost office, unless he should follow a business which needs peculiar light or air. The rooms in consequence are to be obtained at a nominal rent, and owners prefer to take all the risk of depreciation from garish advertisements rather than allow a part of their property to remain vacant. There are always people to take advantage of unsuccessful property, and the illuminated lettering is only one case. Years ago Paris set the bad example, but in London we have gone beyond the practice of that city. If the County Council will take up the subject with zeal the evil is sure to be overcome. The sky-signs were not more of an eyesore, and they vanished as soon as it was ascertained the Council had resolved to oppose them. The illuminated signs are not likely to offer more resistance to Spring Gardens if the authorities will act with resolution.

THE National Society for Checking the Abuses of Public Advertising propose to meet the difficulty by a process of minimising, viz.:—"(*a*) A limit of height to be prescribed, above which there should be no exhibition of letters or other speaking emblems. (*b*) A limit to the size of letters in any position. (*c*) A rule that the space occupied by advertisement placards or letters should not exceed a certain ratio to the size of the building to which they are affixed." Doubtless, if the upper parts of buildings could not be obtained, the illuminated signals would not be used, for in those parts alone is the space to be granted on economical terms. But the danger to people would be increased in proportion as the signs were brought nearer the street level. Limiting the size of letters and insisting on a fixed proportion between them and the size of the building would also be fatal to that method of advertising. People do not wish to see an abuse put down by indirect means. It would be more straightforward to say certain signs are not adapted to uphold the amenity of the Metropolis, and that ground should be a sufficient justification for their removal.

OUR readers may have some recollection of the *fiasco* connected with a competition for a State Capitol in Harrisburg, Pennsylvania. The building which served that purpose was burnt down two years ago. The architects who succeeded in the competition were supplanted, and, after a series of lawsuits, it was decided they were without any rights. The building which was erected was opened a few weeks ago, or rather, we suppose, a part which will suit temporary needs. The Governor, at the inauguration, said there were scores of barns in the country which were far more attractive in appearance, for it looked like a hastily-erected factory building, and was repulsive to the eye. The financial arrangements are as strange as the design. The expense was fixed at 550,000 dols., which, according to the commissioners, was a sufficient sum to erect a building for the Legislature and its employés. The Governor says a sum of 2,500,000 dols. must, according to one estimate, be spent on the building in addition to the money already laid out on it. But he believes that twice the sum will have to be provided. The Governor considers the commissioners had no right to foist upon the taxpayers of the commonwealth an incomplete structure, which will require an expenditure of at least a million of dollars to make it habitable under their present plan, and millions more to add the wings as set out in their drawings. They had not the right to expend the money appropriated in such a way as to compel the legislative branch of the Government either to tear down and render comparatively valueless all that has been done, or to add millions of dollars to carry out their ultimate design. Finally, the Governor recommends, for the sake of economy, that every part above the foundation walls should be demolished, for in the end it will be better to sacrifice the amount already wasted than to continue the system which was adopted by the commission. In the whole history of competitions, there is not a more curious chapter than that relating to the Pennsylvanian Capitol.

THE STRENGTH OF MATERIALS.*

WHEN we find it requires ten years to exhaust the first edition of so important a work as Professor Unwin's on "Testing of Materials," it is evident that the subject is one of those which architects and engineers leave to specialists. Although they might be desirous to be assured of the strength of the stone, brick, concrete and metals which are employed in the structures they design, yet they cannot spare the time or possess the apparatus required for experiments. An enthusiast like Tredgold can at all times contrive to gain knowledge about materials, although living in a state of poverty; but martyrs to science of his class are likely to be few. Besides, such experiments as he engaged in would not satisfy modern needs. They were inspired by an aim that differed from that of the earlier investigators of the subject, for Tredgold wished to be useful to practical men, while his predecessors were more anxious to exhibit some phenomena of matter. Eaton Hodgkinson was able to operate on larger specimens than Tredgold, for he had Fairbairn at his back, who allowed him to employ the appliances which were in the Manchester works, and constructed others specially for the testing. Yet when a novel structure like the Britannia Bridge was proposed, it was necessary to institute a costly series of experiments in order to determine anew problems of tensile and transverse strength of which solutions could be deduced to some extent from the information which was already in print. During the last half-century experimenting has not ceased, and yet, if we may judge by what is being done every day in America and Germany, it becomes evident that more reliance is placed on a special test by means of one of the latest varieties of machines than in all the recorded results which can be produced from books.

In cases like the Britannia and the Forth Bridges, where novelty of construction is desirable, testing is indispensable. For the cloud-capped layers of offices which are being raised in America it is always wise to ascertain what weights are required to crush the materials that have to sustain the greatest load. It is also well to discover whether some new kind of material, natural or artificial, has as much strength as ordinary materials which resemble it. But at a time when parsimony inspires many of the arrangements for building, it is hardly desirable that materials should be strained under the warrant of science to a degree that approaches danger. Get a reasonable amount of work out of a steel or a timber joist, but do not make it a scientific marvel in order to exemplify how far it is possible to go without a collapse. That seems to be a not uncommon practice in America, for the love of risk which at one time gave interest to journeys in steamers is now seen in buildings and other structures, which occasionally collapse when a slight additional weight comes upon the materials. The desire for saving is so general in some classes of construction, if it were not for Building Acts and by-laws the loss of property and of life would occur more often than is now recorded in newspapers. The practices dignified by the title of "economical building" are too often dangers to the State, although they are supposed to be sanctioned by science. The Tay Bridge, for instance, was the work of a mathematician, and was supposed to comply with the conditions which theory as taught in universities demanded, but it was no more adapted to the needs of a material world than those lines which have length without breadth.

What surprises may be devised in engineering nobody can foresee, and for the engineer experiments in testing must accordingly become suggestive. The fact that undoubted changes sometimes leave no outward or visible sign, only incites to further inquiries. For example, we are told by Professor Unwin that "a bar subjected to so many repetitions of loading that it is known to be on the point of breaking, or a piece of a bar already broken in an endurance test, gives in the testing machine no indications that the strength or ductility has been altered." That sort of anomaly will not be taken as an obstacle to research; new machines will be devised to deal with it, and observations with more powerful microscopes or other means will be employed to explain why there is such a variation from what appears to be an universal law. To the engineer, many of whose structures are subjected to dynamic force, it is important not only to know that iron or steel can be fatigued, and become less capable of performing its allotted task, but it is well to have the knowledge verified and confirmed in several ways. Iron or steel as employed in buildings does not undergo the toil which is common in railway bridges, although if what is called the "safe load" is much exceeded, as is too often the case, fatigue is as inevitable as in the case of girders over which locomotives pass several times in an hour. The architect has not, therefore, continual interest in the fracture of bars. He works on a small scale, and has not those "perils which environ the man who builds with naught but iron."

But the architect can hardly fail to remember that at one time buildings were erected of a very complicated sort, and he must ask himself by what process was the strength of materials in novel forms determined. Was it by means of repeated failures? Viollet-le-Duc tells us: "It was necessary to rebuild all the flying buttresses in the early Gothic monuments some years after their construction; and then men either contented themselves with raising the summit of these buttress-arches, or they doubled them by a second arch." It is evident, however, that at an early period of Gothic they were able to realise not only the resistance which had to be offered by a mass of masonry, but the part which every course had to sustain. Sometimes they preferred small stones with thick mortar to large stones. As Viollet-le-Duc says, when they used soft stones for points of support height was given; hard stones were kept to be used for ties or lintels. He points out how "a Burgundian architect in the twelfth century did not build at Dijon as at Tonnerre, for if we find in the same province the influence of the same school in the execution of the masonry, we remark considerable difference resulting from the nature of the stone employed. But as in each province there is one prevailing kind of material, the architects adopt a method of building in conformity with the nature of those materials. Burgundy, so rich in stone of a superior quality, furnishes us with the most proof of this fact."

The only machines and apparatus existing in Mediæval times which bore any resemblance to those now employed for testing materials were the appliances for torturing men in feudal dungeons, and it might be imagined it was from the operations on the human body that the pulling, twisting and compressing of materials in engineering laboratories were derived. The common-sense of the builders inferred from the evidence afforded by the examples of masonry they saw around them, principles of construction which could not be easily improved by the assistance of testing machines. In engineering structures of steel, or sometimes even of timber, it is possible to anticipate the work which has to be done, and experiments on specimens become, therefore, indications of what will occur. With masonry, on the contrary, preliminary trials are not of much use in revealing the future effects. Professor Unwin acknowledges this when he says, "It is quite impossible in any actual structure to secure a simple condition of crushing stress. Settlement, imperfect bedding, unequal compressibility of different blocks, and other causes introduce unforeseen and incalculable straining actions." It is well to bear these facts in mind, for of late years there are exaggerated notions abroad concerning the advantages which science can confer on architecture. As yet chemistry has not done much to encourage architects to devote their attention to it, and there is more likelihood of ensuring the erection of buildings that will endure from a study of ancient examples than from crushing large or small specimens of stone and cement. The pedant in the ancient comedy who expected people to judge of the character of his house from a single brick was not considered to be a wise man. But he is hardly as ridiculous as the young man who, from seeing a few bricks succumb beneath pressure, poses as a representative of the new school of architecture which, like an old-fashioned Adelphi farce, is to be based on the smashing of things.

It is right, however, to have bricks and other materials smashed to pieces. At a time when science enables men to make worthless products appear to have the qualities

* *The Testing of Materials of Construction: a Text-book for the Engineering Laboratory and a Collection of the Results of Experiments.* By William Cawthorne Unwin, F.R.S., &c. Second edition. (Longmans, Green & Co.)

which are most desirable, it is well to employ science as a detector. To know how a brick, a piece of stone or timber, or a part of a girder, will conduct itself when operated on by a testing machine, is desirable information for an architect. The result is not a guarantee that all the materials which are represented by a few victims taken at random are satisfactory; but there is, at least, the satisfaction of knowing that an effort was made to arrive at the truth. The tests, however, should be left to experts. Pupils would, of course, be glad to have occasional opportunities of discovering what the breaking weight of a building material is, but an ordinary office is not adapted for the efforts required to overcome cohesion. A trustworthy machine is, moreover, costly, and only in cases of large works is the expenditure on one to be recommended.

The book by Professor Unwin will have most value for those who make testing their life-work. In the pages will be found not only a record of his own wide experience with a variety of materials, but of the results obtained by other experimenters. It would be wrong to suppose that only professional testers can turn the pages to account. Herschel long ago pointed out the difference between the notion which the word "iron" suggests to the gaoler and to the electrician. To one it is an obstacle to movement, whereas the other accepts it as the freest channel of communication. In the same way, after having experience of the behaviour of materials in testing machines, one cannot help always realising that the strongest substances are frail, and endurance is merely a question of degree. War, too, is always going on, and it is only by mutual checks that stability in structures is guaranteed.

The chapters at the beginning of Professor Unwin's book could be introduced in any treatise on construction. The "mechanical properties of bodies," the "plasticity and hardness of materials" are subjects which can be considered by themselves. "Testing machines," "measuring instruments," "autographic recording apparatus," "procedure in ordinary testing" are of another character. In a third class we can place those on "elastic constants for metals," "cast-iron," "iron and steel," "timber," "stone and brick," &c. In the last division more especially the architect and engineer will find matter which interests them. The results of many investigations are given in the pages, and the differences between the figures are perhaps most instructive, although they are occasionally inexplicable. For instance, it is allowable for anyone who has witnessed the process of iron making to conclude that a plate is homogeneous, and that a strip can be cut from any part to serve as a test-piece. But there can be variations in the strength and other qualities of a plate. The Professor says:—

> Some experiments seem to show a more or less considerable difference of quality in pieces cut from the same plate. No doubt in some of these cases the differences are due to errors in testing. If the testing machine is not itself inaccurate, still imperfect centring of the specimen in the machine, or imperfect gripping of the specimen in the shackles, may give rise to considerable apparent differences of strength. But in other cases there appear to be real differences in the quality of the material, and the limits of such differences are not at present determined. Sir B. Baker has stated that entire bars, 16 feet long, 10 inches wide, and 1 inch thick, gave an average tenacity of 19 tons per square inch; while ordinary test-pieces cut from the same bars broke at a stress 35 per cent., and even in some cases 75 per cent higher. An iron plate was cut up in the workshops of the Compagnie des Chemins-de-fer de P.L.M. into thirty-two test-pieces. The strength lengthways varied from 20·32 to 29·21 tons per square inch, and crossways from 20·32 to 23·50. The stretch varied from 12·5 to 21·5 per cent. lengthways, and from 7·0 to 14·5 per cent. crossways.

The figures are remarkable and important as showing that uniformity in the quality of a building material is assumed rather than proved by experience. What is true of iron is exemplified in a stronger degree in other substances. It is, therefore, well to realise that testing, like other processes gone through in pursuit of truth, has its limitations, and when all is discovered we have gained no more than will enable us to strike an average. As Stuart Mill says, the practical knowledge of mankind is composed of approximate truths. Those who are sanguine that science is to lead them to a new and nobler architecture than the world has seen will do well to remember that fact. And here it may be well to mention a curious circumstance. A piece of Scottish iron deeply corroded was found on the shore of Loch Maree where in the sixteenth century iron forges were in operation. It was tested, and the tenacity was found to be 25·4 per square inch, or as much as is now attainable with scientific processes and costly machinery. The co-efficient of elasticity was 13,600 tons per square inch.

A tree grows under such variable conditions of wind and weather, it never answers to be dogmatic about the powers of timber. We are informed that "the deflections of timber are never quite regular, and, strictly speaking, timber has no elastic limit; it is not a homogeneous material, and different parts give way differently." With a material that is so irregular there should be allowed a large margin for safety, and the proportions adopted in structures that have stood well should not be abandoned in haste.

At the present time people are often heard to say that additions can be made to Portland cement which increase its value as a building material while diminishing the cost of production. Professor Unwin does not adopt that view. He offers the following remarks on the subject, which deserve attention:—

> Adulterants are in some cases added to Portland cement in order to cheapen its cost. Of these, blast-furnace slag is one of the commonest. Although certain qualities of slag have, when ground and mixed with lime, a considerable value as cement, and might under proper conditions be added to Portland cement without danger; nevertheless, as commonly used, slag is a mere adulterant of little more value than an equal quantity of sand, and it contains ingredients likely to be dangerous. In the opinion of some manufacturers, the addition of Kentish ragstone to Portland cement increases its strength. The inquiry carried out by Messrs. Stanger & Blount shows that a perfectly sound cement is weakened by an addition of ragstone. Cement not perfectly sound may be temporarily improved by the addition of a proportion of ragstone. But if the cement is rendered sound by aëration this advantage disappears.

Any one of the extracts we have reprinted will give an idea of the spirit which inspires Professor Unwin. He does not attempt to exaggerate the advantages of testing or to conceal its shortcomings. The pages are judicial in tone, and the conclusions are not arrived at without impartial consideration of evidence. The book is, therefore, adapted to be a standard with which any new facts that further experiments can elicit should be compared, although it is not likely any of the inferences of the Professor will be set aside.

SYSTEMS OF DISTRIBUTING AND GENERATING ELECTRICITY.

By F. J. Warden-Stevens.

(*Continued from page* 60.)

In considering the generation of electricity the question of the motive power has to be dealt with. Now, there are two practical sources of power—water and coal—and it is certain that only capital outlay, cost of working and reliability, should be allowed to influence the decision as to which is adopted. The motive power which will give the best return consistent with reliability is required.

Water Power.—Wherever water power, of whatever quantity, is available, it should be dealt with carefully. It is not necessary that the power should be sufficient to supply all the probable demand, neither is it necessary that it should be absolutely reliable, in order to make it worth while to consider its adoption.

The chief characteristic of water power is that the coal bill is removed, usually at the expense of the capital outlay. The total saving in the cost of working by adopting water power wholly or partially must, in every case, be more than sufficient to pay the capital charges involved. If it is, then the extra capital outlay will be well advised.

The total capital outlay must be ascertained for two schemes—one with the water power, and the other without—using the most favourable site for each scheme, and the cost of working in each case must be obtained. It is then easy to see which scheme insures the largest return.

The use of water power may make it worth while to take the site of the works outside the town, and so increase the cost of mains and perhaps machinery; it may make it worth while to go to the expense of erecting a building on expensive land, and perhaps to expend a large sum on foundations for buildings owing to unsuitable ground, or a large amount on earthworks in order to utilise the water power. It is evident that this question can only be decided by an expert.

There are two points of view from which water power may be considered—(1) as a primary source of motive power, (2) as a secondary and auxiliary. For instance, it might be quite economical, where the alternating system is to be used, to run the day demand from a small amount of water power, which may be easily obtained, while it may be impossible to erect a water-power plant to supply the whole of the demand at a reasonable expenditure, especially if the supply of water is in any way uncertain.

Should the supply not be equal to the maximum demand, it is quite sufficient if it is fairly proportional to the demand—that is, more should be obtainable in the winter than in summer, or at least a slight scarcity in the summer will not be so serious as a stoppage in the winter. However, even if floods are fairly frequent, it may be economical to erect a water-power plant with a reserve, assuming the cost of earthworks is not too high.

The essentials of a reserve are that the plant shall not be expensive, but it must be reliable; and in this connection it may be of interest here to suggest that where the gas supply is in the hands of the local authority or in that of a friendly company a satisfactory and inexpensive reserve are engines supplied from the gas mains, as the cost of plant is very low, power is available at any moment, and as it is not used for many days in a year the cost of working will be low. The gas undertaking benefits to some extent at least, whereas if it is suspected that the supply cannot be relied upon because of opposition, the gas authority will lose some revenue and will gain little in any way, as gas plant is not essential to a gas supply from the mains. Cheap "producer" gas is an exceedingly good and cheap substitute for the town gas, and the reserve plant is not even then so expensive to erect as an ordinary steam plant would be; in fact, the saving is about equal to that of the cost of the chimney-shaft. If steam turbines are used there will be little, if any, difference in cost.

After preliminary investigation, if it is decided that water power by itself, or in combination with a reserve, is available and will be financially successful, it is then worth while to discuss the necessary arrangements for utilising it.

Where the maximum power available continuously is less than the maximum required, it may be utilised in two ways—(1) by storing the water day and night, and then by letting it run through rapidly in the evening when the light is required; (2) by keeping the machinery running day and night, and storing the electrical energy. In case (1) a large turbine plant, large earthworks, &c., will be needed; and in case (2) the plant will be small, but a large battery of accumulators will be needed. It is not necessary that water should be turned into the river after use; for instance, it may be practicable to deflect water from a river and turn it into the sea by a short cut when the river does not reach the sea for miles. Again, it may be feasible to turn water from a river into a canal or into another river. The important point is that the water shall fall as great a height as possible. The power available from a given flow of water is directly proportional to the height through which it falls. It is usually a condition that when power is obtained in any large amount from a river the water shall find its way back to the river again after use. If this were not insisted upon, the bed of the stream might be dried up for miles. It is, however, often possible to take a small proportion of the water from a river entirely without doing much harm.

In considering the question of storage, it is, of course, necessary to dam the stream in order that the water shall run into the reservoir, and in many cases the stream itself is used as a reservoir in this way. The only object or use of a reservoir is to enable the user to obtain a larger power for a shorter time than is normally available continuously from the flow of water. It is in many cases very necessary that the water should be so used as not to interfere with the use of water lower down the stream, and in this case, of course, storage is of little use. It is then better to pass the water through the turbines when required, and allow it to run over the weir at other times. The result will be that the use of water lower down the stream will not be affected. The question of water *v.* electrical storage is best settled for each case. It may be said that it is a question of capital outlay and attention required in each case.

Water Races.—Too much attention cannot be given to the earthworks for utilising water power. It is very necessary that the races be large enough to allow of the largest quantity of water flowing with as little loss of head as possible. The loss of head can be reduced to any extent by the expenditure of capital, and in each case the exact amount to which it is desirable to reduce the loss can be calculated. It must be remembered that if there is a fall of 10 feet, and 1 foot head is lost in the races, 10 per cent. of the power is lost. If now there is the same quantity of water, but a 40-feet head is obtained, the same race will, roughly speaking, carry four times the power, but the loss of head will only be 1/40, *i.e.* 2½ per cent. It is therefore evident that the races must be very much larger for small heads than for large, and in a greater proportion than that in which the head diminishes. For half the fall, then, for a given power, twice the quantity of water flowing is required, and the loss is double the percentage of the whole power. The races should be four times as large at least. It is as necessary with modern machinery that the tail-race (that leading the water from the turbine) shall be as large as the head-race. This means in most cases that the tail-race must for a long distance be cut to the depth of the fall, and also in addition a distance equal to the depth of the head-race. For this reason a long head-race and short tail race are advisable.

Open races are used for falls up to, say, 30 to 40 feet, but for higher falls than these it is usually cheaper to provide closed ones. In this case the laws are just the same, except that the pipes may be laid on the surface of the ground and need not be level. The height of the turbine cannot be more than about 24 feet from the lowest point of the closed tube, otherwise the water will form a vacuum, and the head will be lost.

It is essential that the water shall enter and leave a turbine slowly, otherwise there will be loss of energy.

The race walls should be as smooth as possible, free from bends (every bend means loss of head, due to the friction and eddies caused by the change of direction), and should be of the same size all along, as whenever the speed of water is changed there is a loss of energy. The bottom should be kept free from weeds, and a proper grating must be provided to prevent any refuse, weeds, &c., from entering the turbines.

It is necessary that the type of turbine be chosen before the shape of the flume is decided. Turbines are now universally used for large power works, and there is no need even to discuss the water wheels of antiquated construction.

Turbines.—Turbines are really scientifically designed water wheels, and are constructed on two principles—the action and reaction type. In the action turbine the water is allowed to impinge on suitably arranged vanes under atmospheric pressure, and the power is transmitted to the wheel by the energy of motion, or kinetic energy, of the water. In the reaction turbine the wheel is under pressure and the pressure of the water is used to cause rotation of the wheel.

The action turbine is usually used for high falls, while the reaction turbine is more applicable for lower falls owing to its high speed of rotation.

A high speed, if it can be obtained without loss of efficiency, is preferable to a low speed for electrical work as both the turbines and dynamos are less costly if made to run at a high speed. There is, however, a limiting speed above which it is not desirable to run dynamos of any size, namely, about 1,000 revolutions per minute for small, and 400 revolutions per minute for large units; so for the high falls an action turbine is more suitable.

The question of the variation in the quantity of water available is also a factor in determining the type of turbine, and if it varies greatly the action turbine is preferable, as its efficiency is not altered by the quantity of water flowing. On the other hand, reaction turbines are more applica

for low falls and for situations where the tail-race varies in level, as they work well if placed some distance above the tail-water, and run at a higher speed with a given head than action turbines.

The very low falls which prevail in England are not generally utilised, owing to the difficulty of obtaining turbines which will run at a fairly high speed, and also at a constant speed with the varying heads met with. The usual requirements are turbines which will run at a constant speed with heads varying from, say, 10 to 3 feet, which will give the highest efficiency at the highest head, and will give constant power at all the heads.

There is one type of turbine, in which the water passes through the wheel parallel to the axis of the shaft, which meets with these conditions fairly. The best speed of a reaction turbine is that at which the periphery of the water inlet is running at an absolute velocity equal to that of a falling mass when the distance through which it has passed is equal to half the head of water available. The speed thus increases with the head. In this turbine there are one or two rows of passages at different diameters round the wheel. If there are two, the inner ones are closed gradually when the fall rises, and thus the wheel is one of large diameter and slow speed. As half the turbine is closed, it takes little water, and is efficient. At the lowest head the whole turbine is in use, the average diameter is small, and the speed is consequently high for that head. As the whole of the turbine is open a large quantity of water can be passed, and so both the speed and power are kept up to that available at the highest head. As a rule the head is lowered in flood time, and consequently there is plenty of water available to make up for loss of head and efficiency.

It certainly appears that this class of turbine should enable many water-power plants to be erected where they would otherwise be impossible.

Gearing for Water-power Plant.—In this country, as before mentioned, the majority of the water-power sites are so situated that the falls available are low and vary considerably. It is essential in such cases, where there is a possibility of the power proving insufficient, that a turbine be laid down which can be used with as little gearing as possible, to reduce the losses.

As dynamos are essentially high-speed machines, for low falls turbines of as high-speed as possible must be erected. Wherever practicable, direct coupling should be adopted, in which case a horizontal shaft turbine is usually erected. Even for falls too low to allow of the turbine speed being sufficient for direct coupling, it is preferable to adopt the horizontal shaft type of turbine for all falls where the dynamos can be driven by a belt from the turbine shafts.

For lower falls than the above (about 10 feet) the horizontal shaft type of turbine becomes impracticable, and the vertical shaft type has to be adopted. When these are used, it is usual to adopt bevel gearing and a countershaft; but toothed gearing is to be avoided as much as possible, as it is expensive and inefficient, and often the cause of trouble through noise.

It is a matter of the greatest importance that the best turbines for the special conditions to be fulfilled are adopted, and it is not advisable to make a point of cost in this case. The most expensive turbine may be the cheapest; several otherwise promising water powers have been unsuccessful because of unsuitable arrangements.

The largest electricity supply works utilising water power in this country is at Worcester. The water here utilised is that of the river Teme, a tributary of the Severn, the site being about 2½ miles from Worcester. The power normally available is 480 horse-power, the fall being 10 feet; the proximity of the Severn, however, causes this fall to be considerably reduced at flood time; the turbines are worked down to a fall of 3 feet, and then shut down when the fall is less than that. As there is no large reservoir, the works also suffer from drought; for these reasons auxiliary steam power is provided, so arranged that the dynamos can be driven from the steam engines or from the turbines, or both simultaneously.

There are four turbines, mounted on vertical shafts geared to countershafting, from which the dynamos are driven by ropes; the steam engines can also be coupled to the same countershaft as auxiliaries, or to drive the dynamos alone when the turbines are not working.

The speed is kept constant with varying load by raising or lowering the admission gate, and so varying the quantity of water. The capital cost and the cost of production are increased considerably by having a reserve steam plant, but in most cases this has to be provided.

On the west coast and in Ireland there is much more water power available, owing to the regularity and amount of rainfall. Several water-power stations are at work, including Galway, Carlow, Killarney, Fort William, Windermere, Keswick, and Lynmouth.

The water supply at Galway is so regular that no reserve plant need be used, but gas plant has now been erected for extensions.

(*To be continued.*)

THE BRENTWOOD INDUSTRIAL SCHOOL.

At last week's meeting of the London School Board the works committee reported upon a question of drainage in connection with the Board's Brentwood Industrial School. The report stated that the whole of the drainage at the school was reconstructed under the supervision of Mr. H. Bradfield, then superior officer for repairs, at a total cost of 503*l.* 17*s.* 8*d.* During last summer an outbreak of illness occurred at the school, and the medical officer of the Board, who was requested to inquire into it, submitted reports, in the course of which he stated:—"It would be well to take the opportunity to have the drainage system thoroughly examined and tested by a competent person; and if it could be arranged for the soil-pipe, which I have already mentioned, to be removed to an external situation, so much the better. I would also advise the committee to take steps to obtain a thorough examination of the drainage system of the school, as in many respects this requires alteration." On these recommendations Mr. Bradfield, assistant architect for repairs, was instructed by the sub-committee on repairs, sanitary works, &c., to make inquiry and to report, and on November 15 last he submitted the following report:—"I have carefully examined and tested the drainage and sanitary arrangements, both with testing-tubes, smoke, and water, but fail to find any defects or leakages. The whole of the drainage was reconstructed under my supervision some five years ago; the pipes are all laid in concrete and jointed in cement. Inspection chambers are provided at all important points. There is a proper and efficient system of inlet and extract ventilation, which I find to be in perfect working order. All wastes are disconnected and discharge over outside gullies, and the whole system is disconnected from the main drainage by a proper intercepting chamber and interceptor. I cannot see that any alterations are required. The medical officer and sanitary surveyor are arranging, I believe, to visit the school this week, and make another inspection and test." The medical officer of the Board, however, was not satisfied, and requested that a further investigation should be made. Thereupon Mr. Peacock, the Board's sanitary surveyor, was instructed by the industrial schools committee to examine the drainage system, and on November 22 he reported serious defects in the drainage. This report was so inconsistent with that of Mr. Bradfield that the works committee determined to consult an independent sanitary expert. Mr. G. A. Pryce Cuxson, F.S.I., A.R.I.B.A., was called in, and the two reports of Mr. Bradfield and Mr. Peacock were submitted to him without names, and he was requested to make an independent inquiry. This was done, and the report of Mr. Cuxson confirmed that of Mr. Peacock. The committee asked Mr. Bradfield for his explanation, but he adhered to his former statement. The committee, believing they could no longer repose the necessary confidence in Mr. Bradfield as their adviser, accordingly called upon him to send in his resignation. Mr. Bradfield, however, had declined to take this step, and it became necessary therefore to recommend the Board to confirm the action of the committee.

The medical officer of the Board reported that, after a careful consideration of the whole of the facts of the case, he was of opinion that the outbreak of illness at the school was to be ascribed to the defective drainage arrangements, aggravated by the overcrowded condition of the school, whilst the school provision for the water supply was not altogether free from suspicion. He suggested that the whole system of drainage should be remodelled under proper skilled supervision, and, pending such a revision, that the boys should not be allowed to return to the school. He also recommended that a material reduction be made in the number of boys at the school, and that more efficient ventilation be afforded in the dormitories. He thought it right, however, to point out to the committee that, in view of

the fact of the school being situated at the bottom of a valley, a ditch receiving the sewage from the houses in the upper part of such valley running immediately beneath it, that the soil upon which the school was erected was doubtless much polluted, and that this unhealthiness of site must necessarily continue, whatever expense was incurred in rectifying the drainage arrangements, and that consequently the wisdom of the retention of the building at all as an industrial school should be considered.

Professor Corfield also reported upon the matter. He stated that he had examined the sanitary arrangements and had read the reports of the sanitary surveyor and Mr. Cuxson and the remarks of the assistant architect for repairs on those reports. At the end of his report Professor Corfield says:—"In conclusion I consider that the drainage and other sanitary arrangements have been well planned and carried out, although certain minor improvements might no doubt be made, as is always the case in buildings where the sanitary arrangements have been carried out so long as seven years ago, and especially where some of the old fittings have been left, in order to save expense, but the alterations required are in my opinion few and inexpensive, and there is no reason why this school should not be a perfectly healthy one. I see no reason at all for any reorganisation of the drainage arrangements, which I consider quite unnecessary."

Lord Morpeth (chairman of the works committee) moved: "That the Board confirm the action taken by the committee in calling upon Mr. H. Bradfield, assistant architect for repairs, to submit his resignation." He went at considerable length into the facts of the case, and said that after a consideration of those facts the committee had arrived at the conclusion that they could no longer have any confidence in Mr. Bradfield. As to his previous service they had no fault to find, and Mr. Bradfield had been a satisfactory officer; but in the matter before the Board he had committed a grave error of judgment. The Board were responsible for the lives and health of the children and for the sanitary condition of their school buildings, and the committee felt that they could take no other course than that recommended.

The Rev. William Brown moved as an amendment that the matter be referred back to the committee for further consideration and report He referred to the qualifications of the experts who had been called in and to the nature of the various reports, and said that the case was surrounded by doubt. There was a great conflict of testimony on very important matters.

Mr. Barnes seconded the amendment.

The discussion was adjourned on the motion of Mr. Costelloe, who said he had never seen a case in which there was a clearer conflict of testimony.

LORD LEIGHTON'S HOUSE.

IN a letter to the *Times* Mrs. A. Orr and Mrs. A. N. Mathews the sisters of the late Lord Leighton, write:—

Three years have now elapsed since our brother Lord Leighton's death, and during this period the atmosphere has never been free from absurdly mistaken reports concerning him. We have hitherto refrained from public notice of these, because we trusted to the energy of our friends and the good sense of the majority of the public to ensure their ultimate extinction; but the climax which they have reached in their latest form makes further silence impossible. According to it the 10,000*l.* which our brother on his death-bed bequeathed through us to the Royal Academy represented no gift at all, but simply the payment of a debt incurred by him during the building of his house. Will you grant us the publicity of your columns for an emphatic denial of this assertion? Our brother was in debt to no man. How often and for what amounts he remitted debts to himself is perhaps irrelevant to the question.

We take this opportunity of contradicting another arbitrary statement which to our knowledge was current up to a recent time—that he would have objected to the preservation for national purposes of his house, and that in supporting the project we were, if not wilfully opposing his wishes, allowing ourselves to be persuaded into doing so. May we assure those of your readers whom it can in any way concern that we are not amenable to this kind of persuasion, even supposing that those who are working in pure regard for his memory could be considered capable of applying it? We have never on any essential point surrendered the duties or the rights of our executorship, and those friends whose assistance in the first stress of our work and sorrow we have always gratefully acknowledged did not ask us to do so. In so far as these rumours affect our brother himself, they are almost beyond the pale of discussion. He had built his house, as it now stands, for his own artistic delight. Every stone of it had been the object of his loving care. It was a joy to him until the moment when he lay down to die. When that moment had come, he bowed to what seemed to him the necessity for its sale. A conscious regret for it at such a crisis would have proved him a smaller man than he was. But to declare that he would rather have seen it thrown into the market than reverently preserved for the use and pleasure of lovers of the beautiful like himself is to put forth an unredeemed paradox, and surely a most foolish one. Whoever first promulgated the idea may have had some fancied reason for its conception. We are all at times subject to impressions which we cannot logically defend. But in matters of business such impressions can have no part. There is in our brother's case no room for them. For the spirit, as for the letter, of his unwritten instructions there exists but one authority—ourselves; and if the person who knew us best thought us competent to the duties of the trust he was laying upon us, no misgiving need be entertained as to their fulfilment. If these simple facts could have been more generally realised some irritation would have been spared to us, some wearing obstruction to the friendly labours of the Leighton House Committee.

A series of lectures is to be given in February and March for the benefit of the fund which is being raised for the maintenance of the house by the Leighton House Committee. "The Art of Floral Decoration in Japan" will be treated by Mr. Kajima, of the Japan Society; "Chinese Architecture," by Mrs. Archibald Little; "The Art of Lord Leighton and Sir John Millais," by Mr. Whitworth Wallis, director of the City of Birmingham Museum and Fine Art Galleries; "Some Literary Associations with the Lake District," by Canon Rawnsley. Miss Wakefield will also lecture on "Schumann," illustrating her discourse by songs. Lady Strachey will give a reading of "The Broken Heart," by Ford.

HEVER CASTLE, KENT.

THE Society for the Protection of Ancient Buildings has had many inquiries as to the alterations to Hever Castle now being carried out by Captain Sebright, the present owner. Hever Castle was built in the fifteenth century by Sir Geoffrey Boleyn, great-grandfather of Anne Boleyn, the hapless mother of Queen Elizabeth, and thus appeals in a peculiar manner to the feelings and sentiments of Englishmen. It must not, however, be forgotten that it is now private property, and, in approaching Captain Sebright, the Society could do no more than entreat a reconsideration of some rumoured intentions, such as the removal of the guard-house, and offer to make a survey of the building and a report upon its condition in the same way as it had lately done in the case of Haddon Hall. Captain Sebright has evidently devoted much study and research to Hever Castle, but it was pointed out that as several of the members had spent years in endeavouring to preserve all that is valuable in such buildings, while at the same time adapting them to present needs, a union of their experience with his knowledge might be the means of solving the difficult problem of saving the old while providing for the new more completely than either party could do alone.

This offer has been declined. No amount of knowledge and research can alone, says the secretary, afford a guarantee against the real interest of our historic buildings being swept away by even the best-intentioned restoration, as was abundantly proved by the restoration of the Château of Pierrefonds by Viollet-le-Duc, the French architect, who had spent his life in the study of Mediæval fortification, and whose works upon the subject are of such absorbing interest.

ARCHÆOLOGICAL EVIDENCE.

ON Saturday a lecture was given in Glasgow by Dr. David Murray, under the auspices of the Corporation. He said that our knowledge of past times is derived primarily from history, the written memorial of human activity, of the events and incidents which make up the lives of nations and of individuals. Such record is necessarily limited in time and in scope. Tradition, the handing down of verbal communication from father to son, from generation to generation, of the recollections of what they have seen and heard, to some extent supplements the written record, but it is obviously less reliable. A more trustworthy source of information is to be found in the monuments which our forefathers have left. The buildings they erected, the works they constructed, the tools they used, the coins and medals that they struck, the figures they carved, the inscriptions they cut, are witnesses of facts which they will faithfully communicate to those who have the skill to interrogate them. Referring to the past as seen by the archæologist, Dr. Murray said, like the poets, archæologists have divided the past into ages—long periods of uncertain duration following each other in a more or less marked sequence. With the poet the ages marked the steps of decline; with the archæologist they indicate the growth and development

human culture, steps in the progress from a lower to a higher civilisation. With both poet and archæologist the last is the iron age, and its predecessor was the age of bronze. But these agree only in name, while in lieu of the golden age the archæologist finds an age of stone. The foundation of the division is the use of stone, bronze and iron for utensils. There was a time when the use of the metals was unknown, and stone alone was employed for tools and weapons. Stone was gradually superseded by bronze, and bronze by iron. This, generally known as the three-age system, is an arrangement of the stages of culture-history which has been placed on a scientific basis only comparatively recently. Thereafter the lecturer dealt with the geological record, the advent of man upon the earth, and the relics which have been discovered of the river-drift men, cave-men, &c. In conclusion, he said that Palæolithic man was not confined to France and England, as might be supposed from the fact of what has been said being founded on material drawn from these countries. On the contrary, his remains are found over great areas of the world; in Europe from Spain to Greece, in Africa from Morocco to Egypt, and in South Africa, in Palestine, in Arabia, and in India. He wandered all over the peninsula from Madras to the Valley of the Nabara, and lived alongside of animals now extinct. From what point man set out upon his wanderings, it is impossible to determine; but it is perhaps probable that it was from Central Asia, and that he gradually spread westwards from India to Palestine, and along both shores of the Mediterranean, and eastwards to China. The period occupied in this dispersion must have been very great, and it is not unreasonable to suppose that man may have set out on his journey to Europe long before the glacial period had closed with us, and that Neolithic man had appeared in the east and in the south, whilst the Palæolithic still occupied Central Europe. The lecture was illustrated with lantern slides.

YORKSHIRE ARCHÆOLOGICAL SOCIETY.

THE thirty-fourth annual meeting of the Yorkshire Archæological Society was held on Thursday in last week at the Society's rooms, Park Street, Leeds.

The annual report stated that owing to deaths and resignations, partly compensated for by the addition of twenty-five new members, the membership had been reduced from 598 to 585 during the year. Three parts of the Journal, Nos. 56, 57, and 58, the last two being the first two parts of Vol. XV., had been issued. It was intended that one of the excursions this year should be to Bolton Priory and Skipton. Of the Record Series two volumes had been issued, namely, Vol. XXIII., being the second volume of the Yorkshire Inquisitions, and Vol. XXIV., another instalment of the Index of the Yorkshire Wills. Another volume of the Index would be issued in the course of a few months. The second volume for 1898 would soon be ready. It was the "History of some Early Yorkshire Schools," by Mr. A. F. Leach, F.S.A., and would comprise copies of charters and other documents relating to St. Peter's School, York, and to some or all of the following schools:—Archbishop Holgate's, Leeds, Ripon, Beverley, Rotherham, Sedbergh, Giggleswick, Hull, Bradford, and Wakefield. The first of two volumes of the Chartulary of the Cluniac Priory of St. John at Pontefract would probably be ready for issue about midsummer; it was under the editorship of Mr. Richard Holmes.

The Chairman (Mr. E. Wilson), in moving the adoption of the report, spoke of the need of an increase of members and the infusion of additional life into the Society. They had 585 members, but that was not sufficient, and if they could increase the number by one-half they would be able to do a great deal more printing than they were now able to do. They should aim at issuing every year one volume bound. This was far better than sending out their publications in parts, in paper wrappers, for these were very liable to get lost. The idea had occurred to him that as the bulk of the volumes put out by the Record Series committee related not to Yorkshire only, but to the North of England generally, they should endeavour to get the support of the other counties in the work. He alluded more particularly to the Index of Yorkshire Wills. Although kept at York, these wills referred to the whole North of England, and why should Yorkshire incur the whole burden of doing the valuable work of making these wills accessible? The Society were rendering accessible for the whole North of England a collection of wills extending over something like 500 years, and if they could enlist the co-operation of other counties they should be able to do the work more rapidly. One of the most important objects which the Record Series was intended to attain was the publication of parish registers.

Dr. Collins seconded, and said he would like to see a society formed to take in hand the printing of the parish registers for the whole of Yorkshire.

The Rev. E. H. Sankey observed that they had been promised for twelve years a volume on church plate, but they had not got it yet. Nothing was said in the report either as to the photographic survey of Yorkshire. If these things were failures, would it not be better to let them drop? If not, they ought to be prosecuted with more vigour. He had recently seen Sir Benjamin Stone, who had asked what was being done in the photographic survey of Yorkshire, and who had offered to come and give a lecture in Leeds or some other centre of population.

It was explained that the compiling of the material for the work on church plate, which would be published in three volumes, was very nearly completed.

Mr. E. A. Fry (Birmingham), hon. secretary of the Parish Register Society, advocated the formation of such a society for Yorkshire. The great difficulty was to find honorary secretaries to do the work, but in a large county like Yorkshire the difficulty ought not to be very great. He thought that in Yorkshire they should have a separate organisation, with a distinct set of members, but the Parish Register Society would be glad to assist in the formation, and it would for the first year bear half the expense of printing parish registers up to, say, 50*l*.

Dr. Eddison asked whether the Parish Register Society had any limits which prevented it from dealing with the North of England. They did not so much need to print the parish registers as to take care of them, for it was a serious thing that it should be in the power of any scoundrel to alter the originals. It always seemed to him a pity to multiply societies, but it would be for the council to consider the question. They might ask the County Council whether they would erect a building for the safe custody of the parish registers of the county.

Dr. Carter Mitchell said the care of the registers was a work for the country rather than for the individual.

Dr. Collins observed that the parish registers were the only history we had of the people, as to 90 per cent. of whom we knew nothing beyond what the registers contained.

Mr. Fry said the operations of his society were not confined to any part of the country. As to the preservation of parish registers, the council of the Parish Record Society had passed a resolution, alluding to the recent Shipway pedigree case, in which it was shown that documents were forged and stolen, and urging the Government to appoint a Commission of Inquiry as to the better custody and preservation of deeds, wills, parish registers, and other public documents.

The Rev. T. T. Smith and Dr. Carter Mitchell cited instances in their personal experience of carelessness on the part of those responsible for the preservation of parish registers.

A resolution was adopted that the council of the Society be requested to appoint a committee to inquire and report as to what they considered would be the most useful line of action to adopt.

The Rev. E. S. Gough said that information as to registers and church plate could easily be obtained through the Rural Deans, and if this were done it would stir up the clergy to take special care of the registers in their keeping.

DUNDEE INSTITUTE OF ARCHITECTURE.

AT the opening meeting and lecture under the auspices of the Dundee Institute of Architecture, Students' Section, Mr. T. Martin Cappon, F.R.I.B.A., delivered the opening address. Mr. J. J. Henderson occupied the chair, and there was a large attendance of members. Mr. Cappon, in the course of his remarks, impressed the students with the great importance of the architectural art, the magnitude and extent of its influence and bearing upon the history of humanity. Architecture, in the general sense of the word, was the art of erecting durable, commodious, beautiful and handsome buildings of all kinds. Architecture could be divided into civil, military and naval classes, any one of which gave scope for endless study and instruction. The architecture with which that Society was associated was civil, including the designing of all buildings to supply the wants of men according to the age, culture and civilisation. Architecture had become by degrees a fine art, differing from the other fine arts in the respect that it was based upon utility, and that it elevated mathematical laws to rules of beauty. Painting and sculpture were only the expression of the feeling of the beautiful, and any creation of architecture must appear to have utility in view. Every feature should have a meaning, and every part of a building ought to show the purpose for which it was designed. A glance at prehistoric ages showed that the caverns and mounds of the Egyptians, the tents of the Chinese, wooden cabins of the Greeks, and the bower of trees of the Goths had all formed the model of their more refined and opulent posterity. Architecture was, therefore, a development of constructive art, with nature as its ideal for proportion and beauty, and each nation had interpreted the art according to its climatic conditions, the materials found in it, its natural characteristics, and such other influences as colonisation, commerce or conquest brought to bear upon them.

NOTES AND COMMENTS.

REGISTRATION of architects is becoming more general in the United States. A Bill has been introduced in the Missouri Legislature which proposes to inflict rather heavy penalties on those who dare to practise without having their names on the register, kept by an official of the State. Anyone in that position who prepares a plan for a new building or for altering a building already existing is liable to fine, varying from 10*l.* to 100*l.* per week. To superintend works is no less criminal. The placing of a brass plate on a door, a card in a window describing the unregistered individual as an architect, or other advertisement, involves similar punishment. Apparently an architect's name must be inscribed in the books for every State in which he undertakes a commission, otherwise he must put up with pains and penalties. The Americans should know their own business, and apparently men like Mr. HANNIBAL CHOLLOP still survive, who declare, in spite of all enactments, "You are not now in a despotic land; we are a model to the airth, and must be jist cracked-up, I tell you."

THE risks from using defective mortar are numerous, for local authorities have in most places absolute power for dealing with it. A decision which was given this week by Mr. Justice BRUCE in SMITH *v.* JOHNSON reveals that a building owner can also have his remedy against a contractor who is not careful in using such mortar as is considered necessary for safe building. The plaintiff contracted with the defendant for mortar which was to be used in the extension of a dormitory attached to a lodging-house in Whitechapel after the completion of the work. The plaintiff was ordered to take down and rebuild the dormitory because the mortar did not correspond with the requirements of the Building Act. According to the by-laws the mortar to be used must be composed of freshly-burned lime and clean sharp sand or grit without earthy matter in the proportions of one of lime to three of sand or grit. The dormitory was rebuilt as ordered. Then the plaintiff sought to obtain from defendant the money expended on the work as well as a sum for loss of rent. It was maintained that the quality of the mortar could not be detected because it was in a wet state. Counsel for defendant maintained that when the contract was made it was not understood that if the mortar was unsuitable it would be necessary to take down and rebuild the dormitory. Besides, the plaintiff should have rejected the mortar when it was supplied. Plaintiff's counsel held that the defective quality of the mortar could not be ascertained until it was used, and as the rebuilding was the result of defendant's acts, he must be held liable for the cost of the rebuilding. Mr. Justice BRUCE considered that, according to the evidence, as the mortar was in a wet state, no reasonable diligence on the part of the plaintiff could have discovered the defects until the mortar was used. The plaintiff was therefore entitled to recover the expense of pulling down and rebuilding, as well as damages. His Lordship assessed the amount at 101*l.* The case is novel, and we hope it will compel builders to give more attention to the ingredients of mortar.

THE election of Associates of the Royal Academy which took place on Tuesday is likely to cause some surprise. A great many artists could be named whose names and works are more familiar to the public than those of Messrs. ARTHUR S. COPE, painter, ALFRED EAST, painter, and W. GOSCOMBE JOHN, sculptor. Having entered within the magic circle they all may acquire new powers, and perhaps surprises await visitors to this year's Academy. M. JULES BRETON, the French painter, well merits his choice as an honorary foreign Academician. He has been one of the most sincere artists among his countrymen. His *Bénédiction des blés dans l'Artois*, which appeared about forty years ago, was a revelation. It startled amateurs and critics by its realism. There was, however, nothing repulsive about it, for M. BRETON'S works are not adapted to serve as illustrations to such a book as M. ZOLA'S "La Terre." The artist has studied peasant life with as much devotion as MILLET, but he does not take so pessimistic a view of their condition as the Barbizon painter. M. BRETON is also a writer of charming poetry, and not long since we gave an account of one of his prose works, which contains an exposition of his principles as a painter of rural France and its inhabitants.

THE United States Consul at Chemnitz reports that the German iron manufacturers are alarmed at the capability of the Americans to compete with them in the German markets. Measures are to be taken to combat the imports by producing iron and steel at the lowest rates. The change has already taken place in some varieties of the iron trades. The Consul is sanguine about the victory. He says:—"If there is one word more than another of importance for our manufacturers it is the word which urges them to meet German manufacturers in South America, Russia, Australia, Africa and the East. Millions of dollars' worth of our tools will be taken just as soon as offered in these markets. If we can send steel to Germany, England and Scotland, surely we should undersell all Europe in far-off countries, which need the tools and implements of mining and husbandry."

A PERIODICAL which has upheld the reputation of Boston, U.S.A., is the *Architectural Review*, which hitherto has appeared eight times a year. For the future it will be published monthly. The change will not, we are confident, have any effect upon the leisurely criticism or the reserve shown in selecting illustrations. The world is in such a hurry it is always refreshing to come across writing and drawing which suggest deliberate work.

THE resolve of the London County Council to offer a yearly salary of 2,000*l.* to the superintending architect is satisfactory. There may be a change in the class of candidates who will apply for the appointment. But an architect who now makes 2,000*l.* a year in private practice can reasonably expect to gain a larger income, and his business after a number of years will have a market value. He will also escape the anxiety to satisfy a great many masters, and it will not be necessary to perform the juggling feats with estimates which would appear to be necessary as long as there is a Works Department. The position of supervising architect is more remunerative than that of a senior surveyor in the Office of Works, but the duties to be performed by the former are less satisfactory, while the tenure is more precarious.

ALTHOUGH the ideal may be banished from most parts of the world, we expect it will still find a home in Germany. But if Professor VON TSCHUDI, Director of the Berlin Academy, can have his way it will be evicted from the Fatherland. According to him, England now exercises the principal influence on Continental art, and that is owing to the common-sense character shown in its art. Idealism and cognate qualities were not sought by English artists, and compared with them the Germans were colour-blind. What the public wanted was to see nature represented as they saw it with their own eyes, and until that was accomplished in Germany the art would not be in keeping with the time.

CATHEDRAL SERIES.—DURHAM: SOUTH AISLE, LOOKING WEST. ENTRANCE TO CHAPTER HOUSE. GALILEE, NORTH-EAST CORNER.

"LANGLEY," WEST HILL, PUTNEY HEATH, S.W.: DRAWING ROOM. DINING ROOM.

THE DENE, NEW FOREST: DINING ROOM.

THE fireplace in the dining-room, shown in the illustration, is built of Corsham and red Corsehill stone, with a plinth of bue bricks set in Parian cement, and its interior is lined with ordinary local bricks laid as headers, showing their silver-blue semi glazed ends. The walls are finished with rough orange-coloured stucco, and the cornice is of wood bulged out at the centre, coloured light blue and white, with a rail of dark oak.

The contractor is Mr. H. E. HALE, of Totton. The stonework has been executed by Messrs. GARRET & HAYSOM, the architect being Mr. R. M. D. LUCAS, of Southampton.

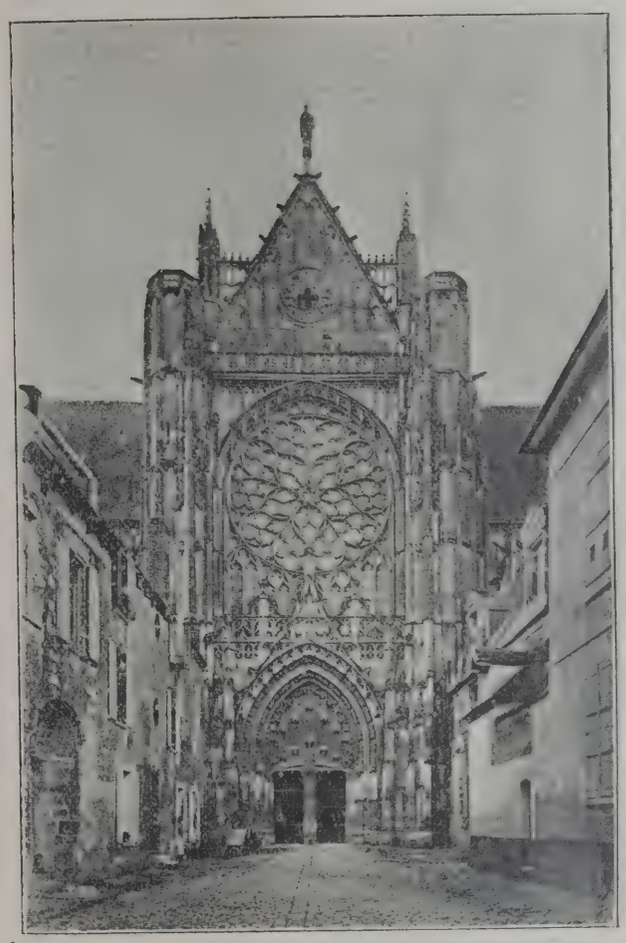
SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

BY THE AUTHOR OF "ECCLESIOLOGIA GERMANICA," &C.

(*Continued from page* 67.)



XI.

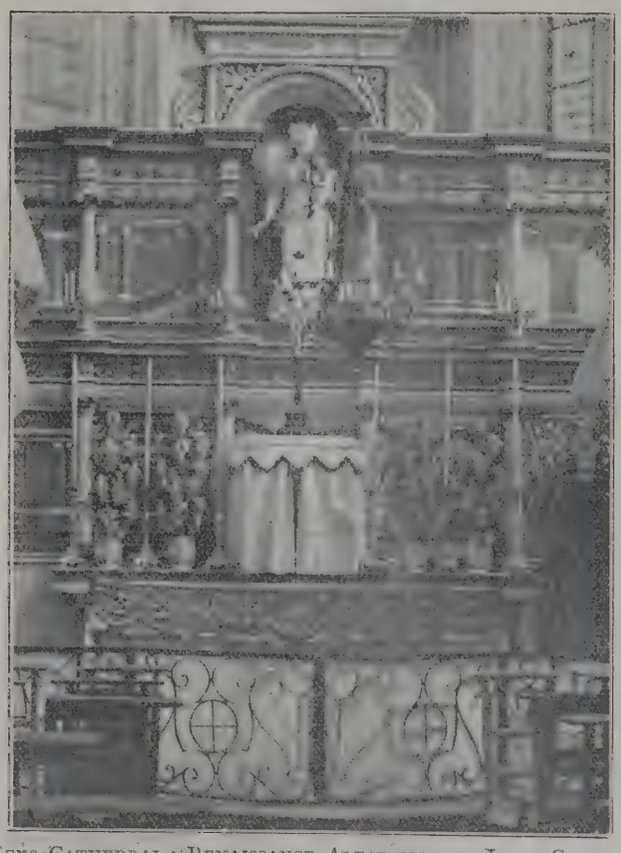
Sens—Joigny.

PLEASANT it is on the morrow of a long day among the ecclesiological treasures of Paris to wake up at Sens, and see the grey west front of the cathedral rising above the tiled roofs of the Hotel de L'Ecu, against a background of sky, purest cobalt. I am soon out, and in the cathedral. By half-past eight I have had a good two hours' work with note-book and pencil, and then return to a light meal served in the courtyard, "assisted at" by the dog, cat and parrot of the establishment. The first lays his head on my knee, the second purrs on the edge of the table, and the third, having descended from his cage, waddles, with as much grace as a swan on a gravel path, about the pavement in front of the *salle à manger* windows, presently partaking of chocolate from a spoon, of which, says Madame, he is very fond, and evincing a desire to swear eternal friendship. About 9 o'clock a big bell—whether Savinienne or Potentienne * I know not—sends its voice over the city, and I re-enter the cathedral with pleasurable anticipations of hearing some good plain chant for an hour or so. I seat myself in front of the choir-screen, but its gates remain unlocked; the huge antiphonarium and graduales are unclasped; the bass-viols, propped up against the lecterns, repose in their green great-coats; and the altar candles are unlighted; so I come to the conclusion that the capitular offices at Sens are not sung *in choro*, but in one of the chapels. And there, sure enough, in that of St. Savinien—which in this cathedral takes the place of the chapel usually appropriated to the Blessed Virgin—I find the canons saying their Mass with the curtains snugly drawn behind the eighteenth-century screen. Having greatly looked forward to hearing the daily offices at Sens chorally rendered, I am much disappointed at not being able to furnish any notes thereon,* so must give a somewhat detailed architectural account of this noble building, whose interior in many points vividly recalls the eastern portion of our own glorious choir of Canterbury, the work, as everyone knows, of William of Sens,† and specially valuable and interesting as being one of the comparatively few specimens of Transitional architecture on a large scale that we possess. The exterior of St. Etienne at Sens, like those of most French cathedrals, suffers from a want of completeness. In common with Auxerre, Meaux, Soissons and Troyes, it has but one western tower, and that has been finished off by an architect of the Flamboyant age; his turret on the south-west corner combining boldness with elegance. The northern tower was for some reason or other demolished early in the "forties"; yet on the whole the west front of Sens Cathedral—with its fine though sadly mutilated First Pointed triple porches, almost classical in their sculpture; its large Geometrical western window; its truncated northern tower; its modern "Majesty" in the gable, and niched figures of bishops in the west and south faces of the great tower—is imposing. Much additional breadth and grandeur is imparted to it by the "Palais Synodal," which, with its six Geometrical Decorated windows, flanks it on the south, presenting a fenestration for grandioseness barely equalled. There is no central steeple at Sens, nor do the roofs of nave, choir and transept meet even in the simple flêche, the absence of which feature imparts an air of great sameness to the outline of so many great French churches.

SENS CATHEDRAL: WEST FRONT.

SENS CATHEDRAL: NORTHERN TRANSEPT.

Perhaps the grandest view of Sens Cathedral is to be had from the small enclosed piece of ground on the north side,



* These two *bourdons*, founded in 1560, escaped the Revolutionary fury. They derive their names from two early Christian missionaries to Sens—Savinien and Potentien.

* I was more fortunate on a subsequent visit to Sens. It was a Sunday afternoon. There had been heavy showers all the morning at Auxerre, but, arrived at the archiepiscopal city, the clouds had rolled off, and lay in Alp-like silvery masses on the horizon. The vast Transitional building was flooded with sunlight when I entered it about three, and the majestic hymn for the Vespers of the Transfiguration, "Quicumque Christo quæritis," was echoing grandly along the vaulted roof.

† Sens was in building 1143-68; Canterbury choir 1174-84.

entered from the narrow stony street leading up to the glorious Flamboyant transept façade by a picturesque Renaissance gateway. Another tolerably general view can be had from the opposite side, standing in the garden of the archiepiscopal palace, a ragged, ill-kept-looking place not to be named in the same breath with one of the prebendal houses in an English cathedral close.

Immediately on entering Sens Cathedral by the western doors its resemblance to the corona of Canterbury strikes one most forcibly. The great circular columns, with their Corinthianising capitals, are set in pairs back to back; the rings on some of the smaller shafts, and the same system of vaulting are features common to both churches. Yet I do not think the detail has the delicacy of that at Canterbury, nor has the whole so airy and *élancée* a character, on account of its greater breadth. Until 1864 or thereabouts the nave aisles opened into Middle Pointed chapels; these, solely from the desire of the architect to bring back this part of the cathedral to its primitive state, have been demolished (O fie! M. Viollet-le-Duc), Romanesque windows reintroduced, and the wall space below pierced with triple arcades opening into low cavernous-looking chapels lighted by small lancets, in which is excellent stained glass by Didron. Of course all this work is good of its kind, and uninterestingly respectable; but the loss of these chapels in an historical point of view is much to be regretted.

Sens Cathedral: Renaissance Altar-piece in Lady Chapel.

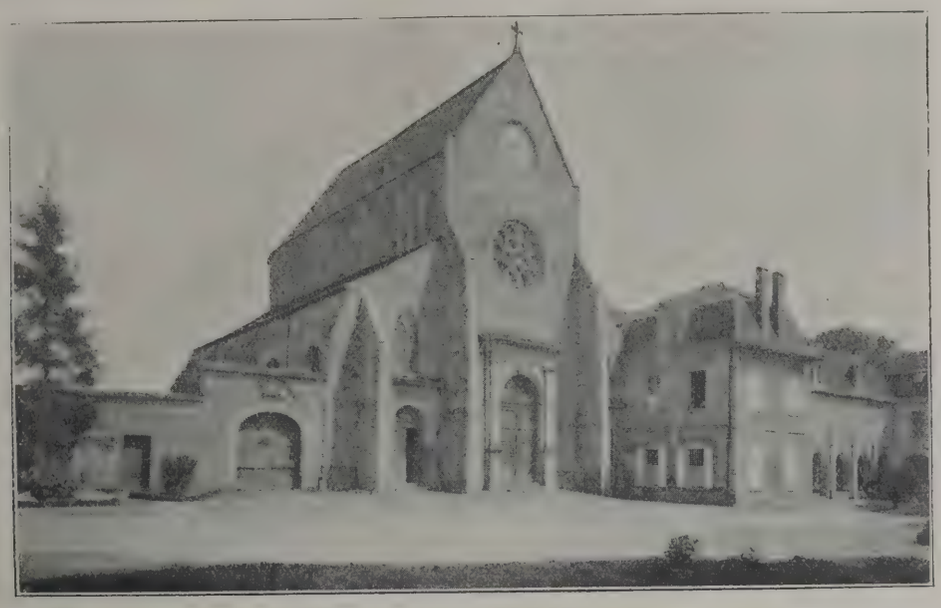
Against one of the piers on the north side is a fine but sadly mutilated reredos. This piece of sculpture formed part of the tomb erected by an Archbishop of Sens—Tristan de Salazar—in memory of his parents. Terribly mutilated during the Revolutionary fury, it was stripped of its statues; but two, that of the B.V.M. and St. Stephen, were restored subsequently. To my disgust, I find all the part of this reredos within pencil-reach scribbled over with names, a pastime which one inseparably associates with the British Protestant public; but, it appears, one is mistaken.

The glories of Sens Cathedral are undoubtedly the great rose windows in the transept—whirlpools of gorgeous, though somewhat coarse, sixteenth-century stained glass, executed by Jean Cousin, a native of Soucy, near Sens. The Flamboyant architect has almost transformed this portion of the cathedral, and one wonders that M. Viollet-le-Duc, with his love of uniformity, has not transmuted it into Transition! Great curiosities exist in the Decorated chapel opening out of this transept on its eastern side, viz. a fourteenth-century statue of the Blessed Virgin, and the Lady altar-piece, a very early specimen of Renaissance brass work, singularly free from the vulgarities and extravagances of the later school.

Tall iron gates admit to the choir aisles from the transepts. The southern aisle contains a staircase leading to the treasury through three beautiful round-headed arches on slender shafts; the northern one, some splendid old thirteenth-century stained glass with subjects from the life of St. Thomas à Becket. He fled here in 1164 to escape the wrath of Henry II., and in the treasury I am shown his mitre, alb, girdle, maniple, stole and chasuble. Like Canterbury, Sens Cathedral was originally planned with a single chapel at the east end, but during the Renaissance period another was thrown out to the south with windows in grisly imitation of Romanesque. In similar style is the chapel to the north, containing Coustou's monument of the Dauphin, son of Louis XV. and father of Louis XVI., properly removed here in 1856 from the choir, where it occupied a far too conspicuous position. There are also fine kneeling effigies of the brothers Jacques and Jean Perron, Archbishops of Sens; also the tomb of the Chancellor Duprat, a plain marble sarcophagus surrounded by bas-reliefs representing events in his life—one his entry into Paris as legate, the other into Sens as archbishop. The central chapel (1206) is dedicated to St. Savinien, and a somewhat painful sculptured representation of his martyrdom forms the reredos, to the concealment of some of the lovely old painted glass in the windows, which, as well as those in the clerestory throughout the building, are of an early Geometrical character. The background to this subject is a drapery in stucco. Seen from the west end of the cathedral, it has exactly the appearance of a piece of sail-cloth temporarily suspended to facilitate repairs. Like those of most French cathedrals, the sanctuary fittings at Sens are in the First Empire style, with spindle-shanked crimson velvet-covered stools for officiants and servers, and so on. The high altar is Classical, a baldacchino on the *motif* of that in St. Peter's at Rome, and the work of Servandoni, 1742, surmounting it. Although, of course, opposite in feeling, this really fine work harmonises better than one would expect with the Corinthian-like Transition columns of the apse and sanctuary,

Sens Cathedral: Nave, looking East.

besides imparting an air of greater length to the choir. A cardinal's hat is suspended just above the high altar. Ten Archbishops of Sens have attained this dignity, and one has reigned as Pope, under the title of Clement VI. (1342-52). The choral arrangements do not call for a detailed notice. The high close screen and gates, and the wainscotted stalls, which whilom concealed the beautiful pillars, have given place to a low screen of wrought iron, quiet and unobtrusive. This is carried right round the apse, where it branches up into coronæ of candles.



The churches of the city of course sink into insignificance beside the cathedral, yet they are worth visiting ; some feature of interest being presented by all. Here are a few notes. St. Jean, standing picturesquely to the east of the cathedral, with its severe-looking western façade and unbroken line of roof, is but a fragment of a once noble church, a mixture of the Pointed of Champagne and Burgundy. The apse and eastern chapels remain *in statu quo*, and so do the huge pillars and arches opening into the transepts, which, as well as the nave and central steeple, have disappeared. One long roof is carried over the whole structure, which now serves as the chapel of the Hôtel Dieu. In the western front is a round window with tracery clumsily but by no means badly imitated from First Pointed. Internally the detail of the apse, which in *motif* recalls Pontigny, is most delicate and refined.

Returning to the western part of the city, and remarking, *en passant*, the noble view of the cathedral from the Place Drapes, I find St. Pierre, a church chiefly of Flamboyant character, and consisting of a nave with north aisle. Here is some interesting coeval painted plass, good eighteenth-century grilles stretching right across the church, and a very fine Corinthian wainscot carried along the whole length of the south wall below the windows. A lofty Corinthian altar-piece, a large eagle lectern in the midst of the choir, a plain barrel-shaped roof with tie beams, and a large circular window with eight cusps, at the west end of the north aisle, are the remaining features which evoke my attention in this church.

During a pleasant stroll in the outskirts of Sens I make the acquaintance of three very good specimens of Modern French Gothic, viz. the chapels attached to the religious seminaries of the Sacré-Cœur, L'Immaculée Conception and Saint Esprit. The stained glass in the last-named, from the atelier of Didron, is by itself worth going to see.

I must not forget that close to the river, which is spanned by a picturesque bridge, sustaining an iron crucifix, stands the little church of St. Maurice, with some thirteenth-century remains in the shape of arcades. For the purpose of widening the river at this point the apse has been demolished, and a clumsy square eastern termination substituted, thus depriving the building of much of that picturesqueness which in its pristine condition it must have presented. A small flêche rises om the roof. With the exception of an hour's visit to the curious and interesting Romanesque church of St. Savinien, to which (standing as it does in the private garden of a conventual establishment) I was able only to obtain admission after wandering round and round for a long time in search of some means of ingress, I spend the remaining hours of my stay at Sens in the cathedral, taking chairs and viewing it from every possible point.

I quit Sens with many regrets early in the forenoon of Wednesday, August 3, and, once more strapping on my knapsack, descend the straggling Grande Rue for the last time. An Englishman in this comparatively little visited old French cathedral city is something of a *rara avis*, and I find that my comings and goings attract a considerable amount of public curiosity. I take off my hat to the great cathedral as the train slowly leaves the station, and as it passes close by the old church of St. Savinien I am able to get a last look at that too, with its beautiful old Early Pointed tower, and low spire rising between the nave and chancel, the whole presenting a very imposing appearance, chiefly from the absence of transepts, the nave aisle being carried along the side of the tower in lieu of them. Another grand church comes into view at Villeneuve, but I do not break the journey (which is a most pleasant one) here. On my left the Yonne dances and sparkles in the glorious summer noontide almost the whole way, until the train reaches Joigny, where I find that railway arrangements enable me to spend a clear five hours in wandering about its steep crooked streets, in which something picturesque occurs at every turn, making one long for the pencil of a Pugin, a Nesfield or a Norman Shaw.

Sens: Chapel of Hôtel Dieu, formerly St. Jean.

The old town, which lies on the other side of the river, possesses three churches, not particularly interesting from an antiquarian, but extremely so from an ecclesiological point of view. Of these churches—all Late in style—I will describe one, St. John Baptist, the largest, and one of the most extraordinary structures of the kind produced by the Renaissance that I have ever seen. St. John Baptist at Joigny is both substantial and lofty, having a nave and choir (with aisles and chapels), both under one line of roof, and a western tower. The clerestory, consisting of large four-light windows in a very coarse kind of Flamboyant, but undeniably imposing, is carried upon arches whose mouldings die off into the piers in lieu of being brought down upon capitals—a very common feature of late Continental Gothic. Between each clerestory window is a slender Tuscan half-pillar, from which the vaulting springs, similar to that in the great Wrennian church of St. James's, Piccadilly ; the aisle's vaulting is, however, much purer. Coloured figures of the Apostles are niched above the nave piers ; and the fittings of the nave and chancel, the latter with return-stalls, are solid and handsome. The apse clerestory windows differ from those in the nave, and are very curious, consisting of two square-headed lights under a round arch, the intervening space being occupied by a simple circle. St. John

Baptist's evinces traces of an earlier building, for there are some good attached columns on either side the nave; one bay (the easternmost) on either side is Middle Pointed, and the remains of a fine tomb and effigy of a knight are embedded in the wall of the tower. At St. Thibault's, the purest of the three churches, the most remarkable feature is the flight of steps inside the west door, recalling All Saints', Hastings.

These extraordinary churches haunt me, and, desirous of procuring photos, I scour Joigny with that object. I inquire at shop after shop, but the answer is, that they have never been "done," or that they never kept them; or last week they had more than they knew what to do with; that they expected plenty more the day after to-morrow, and so on; till I give up the search in despair. No one on the way from Paris to Dijon should omit visiting Joigny; it furnishes an excellent example of an old French town, with its walls and its gates flanked by sugar-loafed turrets, outside which the boulevards, completely encircling the place, make a most enchanting foliaged walk; here, having exhausted the ecclesiology of Joigny, I stroll for a considerable time, book in hand, until five o'clock, when I am once more in the train, *en route* for St. Florentin.

I catch a glimpse of a church or two. A very fine one occurs just before reaching the junction at Laroche—long, cruciform, with a low central octagonal tower and pyramidal capping. There is a short wait at Laroche, while the engine goes off on some unknown errand. Walking up and down the platform, it is amusing to watch the occupants of the train, which is a very long one, bound for Marseilles. Soon it is off again, and St Florentin, with its great Beauvais-like church perched on top of one of the two hills on and between which the town stands, comes into view about six o'clock. Here again the railway is still further removed from the town—quite a mile and a half of dusty road intervening between it and the station, so I am glad to avail myself of the omnibus. Mounting to the box, and chatting with the driver—an Alsatian, who amuses me not a little by his endeavours to spell out the titles of the few books which I carry strapped together—the drive from the station to the town of St. Florentin proves a very pleasant one, the declining sun throwing a glorious flood of light over the flat country. Bedroom inspected and the dust of travel removed, I descend to the *salle à manger*, Madame informing me on the way thither, with an air of great importance, that I shall meet three English Messieurs at table. As they "speke the Angleish," I suppose they are all one to Madame, but the said Messieurs turn out to be Americans—three very gentlemanly young fellows, whom it is a real pleasure to meet and converse with once more in the mother tongue. So animated gossip ensues pending the arrival of, and during, dinner, which is served in the pleasant *salle à manger*, whose windows command a fine tract of open country lying north of St. Florentin.

(To be continued.)

SOCIETY OF ARCHITECTS.

ON January 26 a meeting of the Society of Architects was held in St. James's Hall. Mr. Walter Emden, president, was chairman. The following paper was read by Mr. David Lyon, clerk to the Edinburgh Dean of Guild Court:—

The Supervision and Regulation of Building Operations, as Exercised by the Edinburgh Dean of Guild Court.

Before dealing with the jurisdiction and functions of the Dean of Guild Court of Edinburgh as they exist at the present time, some short account of the origin and nature of the Court may be of interest to you, as, so far as I know, no similar tribunal exists in England.

The Dean of Guild Court derives its name from the title of its president, the Dean—or Lord Dean of Guild, as he is by courtesy styled. The Dean is the head of the Guildry of the city, a corporation or municipal body of great antiquity. The history of guilds is a very interesting study, on which a great deal has been written, and there is no doubt that from the earliest times merchants and skilled craftsmen have banded themselves together in these associations or unions for the preservation and promotion of manufacturing and trading interests. I suppose one of the earliest of these guilds may be said to have had its origin at the building of Solomon's Temple, and still survives in the shape of the Freemasons' craft. Another occasion on which we get a glimpse of the existence of such a society occurs, as you will remember, when Demetrius the silversmith, alarmed by the new doctrines preached by St. Paul, called a meeting of the trade, and roused them to action by the cry that the craft was in danger. Since those times guilds have existed in most civilised countries and for many purposes, and you have here in London at the present time many examples in your wealthy and powerful City Companies.

In the case of Edinburgh, the Guildry consisted, so far as we are concerned to know, of the merchants of the burgh, and, as this corporation contained within it all the men of substance and standing in the burgh, they appear to have assumed, or been vested with, the power of regulating the public affairs of the community. For convenience, no doubt, their business was conducted and disputes were settled by the Dean and a small council or committee, and in this way was originated the Court of the Dean of Guild.

There existed at the same time other magistrates in the Lord Provost and bailies or bailiffs—corresponding to the Lord Mayor and Aldermen of the English burghs—who were appointed by the King to collect all rents and customs payable to the Crown, and who also exercised jurisdiction in criminal matters, and were responsible for the defence of the city—our friend the enemy in those days being usually the English—but the Court of the Dean of Guild had always an extensive jurisdiction in mercantile and maritime cases, and an exclusive jurisdiction in what are called cases of neighbourhood.

Lord Deas, one of the judges in the Supreme Court, said: "There has been immemoriably recognised in the royal, burghs of Scotland what is called the law of neighbourhood, or good neighbourhood, with regard to buildings particularly as to their height, safety, and boundaries, under the jurisdiction of the Dean of Guild, and we have both ancient and authoritative confirmation in our Institutional Writers of this being the law and practice."

Lord Erskine, one of the earliest and most famous of the Scots Institutional Writers, says: "The Dean of Guild is that magistrate of a royal burgh who is head of the Merchant Company; he has the cognisance of mercantile causes within the borough, and the inspection of buildings, that they encroach neither on private property nor on the public streets, and he may direct insufficient houses to be pulled down. His jurisdiction has no dependence on the court of the borough or Bailie Court."

He refers to an Act of the Scots Parliament of 1593 as the first statutory authority for the Court, but in 1584 the Dean of Guild Court of Edinburgh had already framed certain constitutions of bye-laws for its guidance, section 3 of which enacts that the Dean of Guild and his council shall "bear the haill burden of deciding all questions of neighbourhood." These constitutions were ratified by an Act passed by the Scots Parliament in 1598, and from that date onwards the Dean of Guild of Edinburgh and his council or Court seem to have exercised such jurisdiction.

I may say that I have in my custody the minute books of the Court in a practically unbroken series from 1529 to the present day, in spite of the proclivities of the English, who had a most provoking habit of ransacking our archives and destroying our records in the course of their incursions.

Dean of Guild Miller, who retired from office in November last, has in his book on the Edinburgh Dean of Guild Court made a most interesting collection of decisions by the Court in those early times, showing the varied nature of its judicial functions. Among the matters dealt with I may enumerate uninhabitable houses, questions between master and apprentice, questions of nuisance, the uses of buildings, obstruction sewers, signboards, weights and measures, questions between merchant and merchant and merchant and mariner, and unfree trading, or the exercise of a trade or craft in the burgh by a person who was not a freeman or burgess of the burgh, or not a member of the incorporation of that particular trade or craft; and it should be borne in mind that at that time all merchants and traders and craftsmen had to belong to the incorporation of a particular trade or craft before they could engage in business.

Mr. Miller quotes one rather quaint instance of a question of neighbourhood which I am induced to relate to you. In 1696 James Duke of Queensberry complained that Mungo Malloch had several windows opposite the Duke's "great lodging in the Canongate," so that the Duke could not "shift himself"—which in English may be interpreted "change his shirt"—or do any other thing, but he is exposed to the view of Mungo Malloch and his tenants. A decree was accordingly issued by the Court ordaining that frosted glass should be put in the windows, or such glass as would not be transparent, and it was ordered that, if the Duke should not be satisfied with that, the windows were to be closed up with stone and lime.

With the advance of the times, which brought with it the institution of popularly elected Town Councils and the establishment of properly constituted legal tribunals for the disposal of all civil cases, the Dean of Guild was gradually stripped of his powers, and his jurisdiction was narrowed down to regulat-

ing buildings within burgh, whether in repairing or taking down and rebuilding old buildings or erecting new ones, and these practically are the functions of the Court to-day.

The Guildry, I may say, still survives, and the members annually elect the Dean of Guild; but here, I think, its public duties cease. The qualification for a Guild Brother, as a member of the Guildry is called, is that he has been in business in the city for one year, or has been a householder and paid rates and taxes for three years; and his election costs him one guinea.

The Dean of Guild, I ought also to say, is *ex-officio* a member of the Town Council.

This short account of the origin of the Court will show you that when the powers and duties of the Court came to be defined by statute, which occurred in 1879, the Court had already, by usage and precedent, acquired a jurisdiction at Common Law, which was reaffirmed in each charter granted by the Court to the burgh of Edinburgh, and was explicitly recognised by the judges in the Supreme Courts.

This brings us now to 1879, when the Court was constituted in its present form. The Edinburgh Municipal and Police Act of that year enacts that:—"From and after the first Friday following the election of councillors in the month of November 1879 the Dean of Guild Court as at present constituted shall cease and determine, and shall on and after that date consist of the Dean of Guild, appointed by the Guildry of the city, as use is, and of ten members then and at the corresponding date in each succeeding year to be appointed by the magistrates and council, five of the said members being councillors, and the other five registered electors of the city, not being councillors, and of whom three shall be persons carrying on, or who have carried on, business as architects, civil engineers, ordained surveyors, or master builders; and three members of the Court, with or without the Dean of Guild, who when present shall preside, shall form a quorum; and the said Court shall have power from time to time to appoint one of their number to preside and act in the Court in (as interim Dean of Guild) the absence of the Dean of Guild; and such Court, as so reconstituted, shall possess and exercise within the burgh all the rights, powers, privileges, functions, and jurisdictions which are possessed and exercised by the existing Dean of Guild Court, by law or usage, within the limits of its present jurisdiction, which are not inconsistent with and which are by this Act conferred." So that, you see, when the Court was reconstituted care was taken to preserve to it all its inherited and Common Law powers.

You will also observe that the Act prescribes that three at least of the members of the Court must be architects, civil engineers, ordained surveyors, or master builders; but, as a matter of fact, the importance of securing that this Court shall be one composed of practical men is so well recognised in the Town Council that the proportion of these is always much higher than the law requires.

For instance, the present Dean of Guild is an ordained surveyor, and of the ten members of his Court there is one architect, one civil engineer, four master builders, one plumber and sanitary engineer, two house and property agents, and a marble merchant. Some of these gentlemen are retired, but the majority are in business, and all are men of standing in their various professions and callings, and of repute as citizens.

So much has the practical nature of the Court impressed itself on the judges in our Supreme Courts, that in a recent appeal against a judgment of the Dean of Guild Court dealing with a practical point the judges in dismissing the appeal put it upon record that "they will be slow to interfere in a matter of this sort with the decision of the Dean of Guild and his council, who are practical men, skilled and experienced in the building trade and other trades connected therewith."

Of course, if, as sometimes happens, a member of the Court is in any way interested in a petition before the Court, he must withdraw during the consideration of the case.

While the Court, however, is more particularly fitted to deal with the practical aspect of the cases which come before it, it may competently, and does constantly, decide the legal questions which may arise in these cases. Obviously in cases of neighbourhood intricate questions arise, involving the construction of titles and the application of the law of servitudes; but in dealing with the legal aspect of a case the Court is advised by its legal assessor, who is always a member of the Bar—an advocate, as he is called in Scotland, the equivalent of your barrister. Only on one point has the Court no jurisdiction, and that is when a conflict of title arises, when two parties produce titles apparently applying to the same property. In such an event the Dean of Guild Court must delay the disposal of the petition until the right of property has been decided in a competent Court.

Although the members of the Dean of Guild Court, with the exception of the Dean himself, are now elected by the Town Council, and five of the ten are members of the Council, I wish to make it clear that the Court is wholly independent of the Council; and while the Council is made a party in all proceedings before the Courts, its position is the same as that of any other party, neither more nor less.

The officials of the Court consist of the Master of Works, the Procurator Fiscal and the clerk, and I shall briefly describe their duties.

The functions of the Master of Works are to report to the Court upon all plans lodged with petitions, and to see that the orders made by the Court are duly executed, and from time to time to inspect the works in progress, in execution of plans for which warrant has been given by the Court; also to report to the Procurator Fiscal any deviation therefrom. He is prohibited from engaging directly or indirectly in any service or employment connected with the professions of architect, civil engineer, or surveyor, or from being connected directly or indirectly with or interested in any contract or works belonging to any branch of the building trades. He, of course, has a staff of inspectors to assist him in his work. I may state that the Master of Works in Edinburgh is also the burgh engineer, and the combination of the two offices has been found of immense advantage in the supervision and inspection of work authorised by the Court and in the detection of unauthorised building operations. This combination has the further recommendation of preventing the friction and overlapping occasioned by two officials with distinct staffs of assistants engaged in work very similar in character. Both systems have been tried in Edinburgh, for in 1879 an independent Master of Works was appointed, but in a few years the friction and overlapping to which I have referred became so apparent that the offices were conjoined, with the most satisfactory results.

The next official is the Procurator Fiscal, or Public Prosecutor. His duty is to take proceedings against any person contravening the law by building without a warrant or deviating from the plans in conformity with which any warrant of Court has been granted, also against the proprietors of a ruinous or dangerous building or structure, to have the same taken down or secured; and generally it is at his instance that all offenders against the Dean of Guild Court law are brought before the Court. He is called the Procurator Fiscal for the Public Interest, and he represents, as his designation suggests, the interests of the public in the enforcement of the law. This, I may tell you, is the practice in all Scots Courts, and you will permit me to say that it is one which might with advantage be adopted in England. In Scotland all prosecutions proceed at the instance of a Public Prosecutor. The vindication of the law is, we hold, a matter of public interest, quite distinct from individual considerations of injury or damage to person or property; and the theory of Scots law is that in the public interest any breach of the law ought to meet with its appropriate penalty, apart from any action which an individual may take at civil law to obtain redress or to secure compensation for any damage he or his property may have sustained. I have made this digression to help to make clear to you the importance of the duties discharged by the Procurator Fiscal in the Dean of Guild Court.

Lastly, there is the clerk of Court, who is expected to guide the Court in matters of procedure. He has always to keep a record and minutes of all proceedings before the Court, including an index—open to the public—of all warrants granted by the Court. He is charged with the safe custody of all plans passed by the Court, which, I ought to say, remain permanently in the possession of the Court for reference. While this is, of course, necessary for the purposes of the Court, it is at the same time of great public convenience. I need hardly say that petitioners do not lodge their principal plans, but only tracings.

Having explained the constitution of the Court and enumerated the officials, I purpose now to deal with the class of cases submitted to the Court, and with the method of their disposal.

The section of the Act prescribing the operations in respect of which a warrant of Court is necessary is as follows:—

"Every person who proposes to erect any house or building, or to alter the structure of any existing house or building, or to use for human habitation any existing house or building which had not been previously used for that purpose, or to alter the mode of occupancy of any existing house in such a manner as to increase the number of separate houses or occupiers, shall lodge with the clerk or Dean of Guild Court a petition for warrant so to do, and such petition shall set forth a description of the intended house, or building, or alteration, and shall be accompanied by a plan of the site showing the immediately conterminous properties, and also the position and width and name of any street, court, foot-pavement, or footpath from which the property has access or upon which it abuts, and also plans, sections, elevations and such detailed drawings as are necessary to show the height and mode of structure and arrangement of the intended house, or building, or alteration, and the lines of the intended drainage thereof, and the levels thereof relatively to the street, court, foot-pavement, or foot-path, and to the sewer or drain, and with which the soil-pipes and drains of the property to be built or altered are intended to be connected, and in regard to any building intended as a place of public resort such plans shall show the arrangements for

ventilation and heating, and the provision intended to be made for ingress and egress ; and all plans to be lodged as aforesaid shall be drawn to a scale of not less than 1¼ inch to every 10 feet, except plans of the site, which may be to a scale of not less than one-fourth of that of the other plans; and such petition, plans and sections, with such alterations thereon as may be made as after provided, shall be registered and indexed by the clerk of the Dean of Guild Court ; and the said petition, plans and sections, and register and index, shall be open to inspection by any owner or ratepayer upon payment of a fee of 1*s*, provided always that the Dean of Guild Court, on a written application, may, in the case of any alterations of any house or building which do not affect the property or the rights of other owners, and which in the opinion of the Dean of Guild Court are of minor importance and extent, remit such application forthwith, with such instructions as he may think fit, to the master of Works, who may thereupon grant warrant for the execution of such alterations ; and which warrant shall have the effect in all respects of a warrant of the Dean of Guild Court, and be subject to the provisions of this Act in the same way as if such warrant had been granted by the Dean of Guild Court ; and all such alterations shall be executed to the satisfaction of the Master of Works, who shall make a report to the Dean of Guild Court."

To this section an addition was made requiring that all plans shall set forth thereon the material proposed to be used in the construction of the elevations of any house or building, and prohibiting any person from building, altering, or rebuilding any house or building until the approval of such material has been given by the Court.

A warrant of Court is also now necessary for excavations intended to be made for and in connection with houses or buildings intended to be erected.

I wish more particularly to direct your attention to the clause dealing with the material to be used in the elevations of buildings, because it makes an advance on the primary function of the Court, which is to secure efficiency of structure.

The power to control the material used in the elevations may, I think, be said to go beyond mere considerations of stability and security, and to confer on the Court a discretion which will to a certain extent entitle it to be reckoned with as a court of taste, because, as far as stability is concerned, I suppose a building may be equally well constructed of stone, brick and cement, iron or wood, or of a combination of any of those materials.

I need scarcely say that in Edinburgh we are proud of our picturesque city, and that there is a strong bias in favour of the use of stone, at least in the elevations of our buildings, along with a desire to secure some measure of architectural feature in their appearance, so that when some more than usually plain or ugly building is erected, the desire is often publicly expressed that the Dean of Guild Court should have the power to consider the architectural character of the plans submitted to it. Now, while we are generally agreed that this would be desirable, and while the Court does as far as possible use its influence in the direction of persuading the speculative builder and the utilitarian to spend a little money on architectural feature and decoration, we have to recognise that a prosaic legislature will not give to any Court or local authority the power to dictate to the individual in such matters. I suppose this is inevitable, because it does seem inequitable to compel any private individual to erect beautiful but probably unremunerative structures for the public delectation, and also because we must admit the force of the maxim that there is no disputing a matter of taste, and on a question so elusive and so personal we can never hope to have unanimity of opinion. We may be assured, then, that the Dean of Guild Court will never be a court of taste in this sense, and this power even of controlling the material of elevations is one which, I am satisfied, it will not be permitted to exercise arbitrarily ; but so far as reasonable men may endeavour to preserve amenity and congruity without entailing undue expense on the owners of property, to that length, I believe, the action of the Court will be sustained.

There is also a proviso in the section of the Act I have just read which I wish you to notice, and that is the clause which deals with warrants for alterations of minor importance and extent, and which was inserted for the following reason:—It was urged that in a large number of cases the alterations proposed, although they were structural, were of such a trivial character that it seemed a hardship to insist on the proprietor of the property being put to the trouble and expense of presenting a petition in the ordinary way to the Court ; accordingly this proviso was inserted, allowing a person in such a case to lodge a simple sketch, accompanied by an explanatory letter, and so obtain the sanction of the Court without incurring much expense or loss of time. This method has been readily taken advantage of, with the result that a class of case which occasioned much trouble to the Court and its officials through the difficulty of deciding whether or not it came within the scope of the Act of Parliament has been provided for in such a simple way that people have freely availed themselves of the facilities thus afforded them for obtaining the sanction of the Court, and I believe that very few even of the most unimportant alterations are carried out without this sanction.

I now propose to deal with the manner of bringing cases into Court and with the procedure of it, and I shall begin by describing the petition, which is the foundation of all proceedings there.

This petition is prepared in accordance with an Act of Sederunt of our Supreme Court, which prescribes the forms of procedure in Courts of royal burghs. It is therefore a paper which would properly be drawn by a lawyer, but for convenience a printed form is issued by the Court, which may easily be filled up by any intelligent person. It consists of three parts—(1) The petition proper ; (2) a statement of facts ; and (3) the pleas in law. The first portion describes the proposals of the petitioner, and also contains a list of the neighbouring proprietors and others whom the petitioner may consider have an interest in the proposed operations, including in each case the Lord Provost, magistrates and council of the city, and craves an order of the Court to serve a copy of the petition on these respondents, as they are called, and to ordain such as have objections to the petition to lodge a note of these within a specified time after service of the petition, the time usually fixed being four days.

The second portion, the statement of facts, describes the property to be built or altered, with its boundaries, and states that the respondents enumerated in the petition are the only parties interested in the proposed operations.

The third portion, the pleas in law, contain what may be described as the legal propositions of the petitioner. The first is that, as the operations proposed are confined to the petitioner's own property, and can be executed without danger, the petitioner is entitled to warrant as craved. The second is one which you will find at the end of all judicial petitions of this kind, and is to the effect that anyone opposing the application should be found liable in expenses.

The clerk of Court, having received the petition and plans, writes the necessary order for service on the petition, which is then put into the hands of the officer of the Court whose duty it is to serve a copy of the petition on each of the respondents named in it.

As I have said, a copy of the petition is in each case served on the Town Council, and this seems the most convenient place to make clear the position of the Town Council or Corporation in the Dean of Guild Court. In the Corporation is vested all public rights and property, and among the rest is the right to the *solum* of the streets ; they have, therefore, naturally an interest to see that public property is not to be encroached on in the course of any building operations. But, besides this, the Corporation has various statutory powers, giving them the control of the laying-out of new streets, and of the height of the buildings to be erected in them, and also of the height of existing buildings which are being enlarged. It has to be satisfied that public sewers are not to be interfered with, that bakehouses and dairies are being constructed conformably to its requirements, and generally that the provisions of the Municipal Acts bearing on such matters are being observed.

The reason therefore for the Corporation being a respondent in each case will be evident to you, but it comes into the Dean of Guild Court just on a par with any other objector, and must maintain its rights there in the same manner as any other respondent.

After service of the petition has been made, the clerk of Court must give notice to the burgh engineer, whose duty it is before the petition is heard to report to the Court whether, in his opinion, the plans are in conformity with the provisions and requirements of the Edinburgh Municipal and Police Acts, and this report is submitted to the Court when it meets to consider the petitions and plans.

Between the time of the service of the petition and the first meeting of the Court thereafter, the respondents are expected to examine the plans of the operations in which they are interested, and to formulate their objections, if any ; and for the Corporation the plans are examined by the city architect. He makes a report of any objections he may have to the town clerk, who represents the Corporation in these proceedings.

The Court sits weekly all the year round, with the exception of the month of August and September, when the meetings are held fortnightly. Before the Court sits in public the members meet and consider all applications, so as to inform themselves as to the proposals of petitioners, to go over the plans, and to receive the reports of the burgh engineer. Each case is carefully considered, and notes are made by the Dean of Guild as to whether or not the plans are such as may be passed, and also of any improvement in architectural detail or internal arrangement which the Court may desire to suggest. The public Court is then held at a fixed hour. The clerk calls a case, and the petitioner or his law agent, and usually his architect, appear at the bar. If the plans are all in order, warrant is granted without comment. If there are only some slight altera-

tions proposed, either by the Court or by the petitioner, to meet the objections of respondents, who are also expected to attend at this time, the matter may be adjusted at the bar and the plans passed. If, however, the objections, either by the Court or by a respondent, are vital, the case is usually continued, to allow the petitioner to decide whether he is to abandon his petition, to modify his plans, or to insist on his position and prepare to fight the case.

(*To be concluded.*)

TESSERÆ.

Conventionalised Ornament.

It is believed by those who have given attention to the subject of natural ornamentation that leaves, flowers and fruit, when selected for decorations, are conventionalised, and it is quite true that the early architects, when they sought nature for ornament, did dispose them in a geometrical manner—they did not place vegetable products upon walls, columns, bosses, &c., in an undesigned way, but they had a system upon which their proceedings were grounded. It would be futile to endeavour to secure greater beauty and precision in decoration without inquiring into those laws which directed the formation of those interesting and often beautiful natural designs of the early architects, and the nature and extent of conventionalism should be carefully analysed and separated from the mis-shapen aboriginal examples in which the early sculptor endeavoured to imitate nature clumsily and imperfectly, but did arrange vegetable products conventionally. The ignorant imitation of nature must not be confounded with the conventional or geometrical disposition. On comparing Anglo-Roman, Danish, Saxon, Norman, Early English, Decorated and Perpendicular, sculptured or carved foliage, flowers and fruit, we shall find that all are more or less conventionalised; but nature in the earlier periods is hardly known as such through the sculptor's want of imitative skill. When foliage, flowers or fruit are selected for decorative purposes they should not be portraits of any single specimen taken from a garden or hedge, but they should be ideal, in fact, more perfect than nature forms any one leaf or flower, so as to realise the remark, "Art is nature better understood."

Historic Portraits.

Archaic arts make monarchs and warriors known not so much through individual features as by generic attributes. It is true upon a temple in Egypt is a profile to which tradition attaches the name of Cleopatra. But still, speaking generally, it may be said that no trustworthy portraits can be found either among the mural paintings of Egypt or the bas-reliefs of Assyria. The same judgment, too, must be passed on the figures in that repertory of English history, the tapestry of Bayeux. The busts of illustrious men and of Roman emperors now in the Capitol museum, some of which, however, are scarcely above suspicion, rank among the earliest and most trustworthy historic portraits. Sculpture in the history of art preceded painting, and carved stone from the nature of things is more likely to endure than the substance of panel pictures; hence the earliest and truest portraits in our country have been derived directly or indirectly from figures sculptured on tombs. Among the monuments in Westminster Abbey which William Burges pronounced authentic are the portrait-effigies of Queen Philippa, Edward III., Richard II, Anne of Bohemia, Margaret Countess of Richmond and Henry VII. Still the noteworthy fact remains that while we have in the British Museum that most marvellous bust-portrait of Julius Cæsar, we are left after the Roman invasion for a period of just about a thousand years with scarcely a dozen portraits of the men whose characters and deeds are indelibly graven on the page of English history. The cause may be found simply in the fact that England was a barbarous land, lying far from the great centres of civilisation. In this pre-portrait period, however, there are at least two paintings which the world has been willing to identify with names honoured in religion and poetry. The head of Geoffrey Chaucer is said to come down to us with the advantage of three centuries of pedigree; and the portrait of John Wycliffe, widely diffused by engravings. With some such few and pleasing exceptions, however, we look in vain for a portrait illustrative of English history till the student comes down to the reign of Henry VIII., when Holbein was a pensioner at the English Court.

Delaroche's "Hemicycle."

When undertaking to execute historic frescoes in the Houses of Parliament, William Dyce, R.A., hoped to call to his aid a troop of adequately-trained pupils as assistants. He tried three or four youths, but found they could render him no help. Thus he was reduced to the needless drudgery of executing even the most subordinate passages with his own hands. Contrast the efficient assistance which Paul Delaroche was able to obtain from pupils in his own atelier when painting his arduous work in the Paris Ecole des Beaux-Arts. To four pupils—of whom the late Edward Armitage, R.A., was one—this great master could safely delegate the labour of drawing in charcoal on the wall, from a small cartoon, the full-sized outline of the entire composition. These disciples were proud of the honour thus conferred upon them; they divided the subject into four parts, and "tossed up for choice," and at the end of a month or six weeks, the outline completed, Delaroche paid them a visit, expressed himself well satisfied with their work, and, putting his hand in his pocket, gave them two or three napoleons. "We, of course," said Armitage, "ordered a good dinner at the Palais Royal, and concluded our evening at the theatre." After Delaroche had made the needful corrections in the outline, his pupils then commenced the task of painting. "A carefully-finished painted sketch," said Armitage, "was our guide, and we were left entirely to ourselves until the whole work was painted. Delaroche then joined us, and for about a year we were continually at work with him." Dyce, as we have seen, dismissed his assistants as incompetent. He, in common with the other English artists employed at Westminster, went without aid through the entire drudgery incident to large mural works, at a loss to himself of that co-operation he had a right to expect, and with still greater detriment to our young artists themselves, who thus missed the best of all possible means of growing in knowledge and gaining a much-needed power.

The Power of Chiaroscuro.

Mere exact imitation is pleasing; the transferring objects subject to continual change from their places in nature to a perpetuity on canvas, the fixing of something transient, is sure to delight the eye and mind, that ever regret that all things are fleeting. Whatever is faithfully represented, and has no accompanying dissonant objects, will be sure to be picturesque, if picturesque be what is paintable; and thus the painter, subjecting all to the common laws of the art, will work upon our natural love of imitation, and excite in us pleasure by the representation of objects in themselves ugly, sometimes even disgustingly so. But in these cases we more admire the art, the beauty of tone, of colour, and light and shade, that give a sentiment to the whole picture, sometimes foreign to, or not necessarily arising out of, the objects represented; and in these cases the apparent subject is subordinate to one that is to be felt. The painter, working with light and shade and colour, has the power to heighten or to obscure, to enrich or to subdue. And under this power many emotions may be excited that shall have reference to the objects represented. Oftentimes these objects are not the first things that strike the mind; we are pleased independently of them, and when we see them there transfer to them the pleasurable sensations that really arise without them. When the sentiment arises from tone and colour, a very high subject, and extreme beauty of composition, one in its own nature so powerful as to force and fix the mind to it would detract from the effect intended by the painter. This is exemplified by Rembrandt; the most faithful representation of really beautiful objects would dissolve by their commanding presence the mystery and magic that pervades his chiaroscuro. By the impression effected by the tone and colour, you are put quite out of the expectation of elegance or beauty; you would as soon think of finding the Venus or Antinous in an Egyptian catacomb. You would wonder how the laughter-loving goddess came there, and in the warmth of imagination, if of a chivalric spirit, might fancy you were breaking a spear with the enchanter who placed her there, and find that you had only poked a hole through the panel with your umbrella. The superstition, the mystery of Rembrandt, is the great subject; the objects must be under its influence, not above it; they must have no power of their own, but become awful for that which is about them and in them, for they breathe an atmosphere of preternatural power. There is a magic circle that separates the spectator from all that is within it; he would not, nor can he pass it, nor can he avert his eye from the mystical fascination. This great painter took care that there should be nothing superior to this effect of tone and colour. As long as all is congruous and no one thing is present to destroy the delusion, we might say all is picturesque. On that view of the term, opposite are equally the picturesque, rough or smooth, for it depends on congruity.

The Mansions of Paradise.

The Rabbinical traditions discuss largely the glories, wonders and delights of the future state. The famous treatise, "Nishmath Chajim," after announcing that there are seven regions or dwellings in the place of evil for the punishment of the wicked, cheers the true believer by telling him that Paradise is similarly partitioned and equally large. It contains seven houses or general receptacles for the blissful. Those houses are unquestionably adapted for a large population, for each house is twelve times ten thousand miles long, and twelve times ten thousand miles broad, 120,000 miles square. The first

house fronts the first gate of Paradise, and is inhabited by converts from the infidels, who have voluntarily embraced the Jewish faith. The second house fronts the second gate of Paradise. Its walls are of silver and its beams cedar. It is inhabited by those who have repented, and they are superintended by a penitent. Manasseh, the son of Hezekiah, is set over them. The third house is opposite to the third gate, is built of silver and gold, and is inhabited by Abraham, Isaac and Jacob, with all the Israelites who came out of Egypt and all that were in the desert. In this house also dwell David, Solomon and all the other sons of David, with the exception of Absalom. But those do not comprehend the whole habitancy of this well-stocked house. It contains, in addition, the whole succession of the kings of Judah, with the exception of Manasseh, who is occupied in governing the second house. At the head of this dwelling are Moses and Aaron. The fourth house fronts the fourth gate of Paradise, and is built, as the first man was framed, in perfection. It is built with oil-tree (olive) wood. But why is it thus built? Because the house is built for the habitation of the perfectly righteous, and their earthly days were bitter like the oil-tree. The fifth house is built of silver, fine gold, glass and crystal. The river Gihon flows through the midst of it. The framework is of gold and silver, with an odour far exceeding that of Lebanon wood. The couches are also more costly than those of the others, being formed of gold, silver, spice and scarlet and blue silk which was woven by Eve; and also crimson silk and the finest linen, and cloth of goats' hair which was woven by angels. In this house dwell Messiah ben David, and Elias of blessed memory; and to the chamber with pillars of silver and carpets of scarlet, where Messiah especially dwells, with Elias perpetually declaring to him, "Be at ease, for the end is at hand, when thou art to redeem Israel." Two houses remain, but description has been exhausted, and they seem to be yet either inadequately finished or inadequately filled. The sixth is for those who have rigidly walked in the path of the commandments; the seventh for those who died, whether of sorrow for the national sins, or innocent and undue victims, swept away in the times of national calamity.

Roeskilde Cathedral.

The cathedrals of Denmark are of great antiquity. Those of Ribe, of Viboig in Jutland, of Lard, Ringsted and Roeskilde, in Zealand, all date from the end of the eleventh or the beginning of the twelfth century—since which remote period, in fact, no churches of any magnitude have been erected. Roeskilde is one of the oldest cities in the kingdom. In the tenth century it was the capital. Canute the Great may be considered as the originator and founder of its existing cathedral, which was completed in the year 1054. It has occasionally undergone slight repairs, but never any material alteration. The edifice is full of monuments of the queens and kings of the ancient race of Valdemar, as well as those of the present dynasty. Some of the earliest sovereigns are enclosed within the shafts of the pillars, or in the walls themselves; a mode of sepulture, it would appear, as honourable as it is singular, since we find amongst the immured the great Svend Etridsen and other renowned and pious benefactors of the church. In front of the altar is the simple sarcophagus of Margaret, the great queen of Scandinavia, erected by her successor, Eric the Pomeranian. The queen is represented lying at full length with her hands devoutly folded on her breast. The style of Roeskilde Cathedral is pure Gothic, but in consequence of the additions which the interior has received from time to time from kings and prelates, that portion of the edifice is more remarkable for historical interest than for purity of style or architectural beauty.

Clarendon House, Piccadilly.

At what is now the south end of Albemarle Street stood Clarendon House, built, as Bishop Burnet tells us, on a piece of ground granted to Lord Clarendon by Charles II. The earl wished to have a plain ordinary house, but those he employed preferred erecting a palace, whose total cost amounted to 50,000*l.* "During the war," says the bishop, "and in the plague year, he had about 300 men at work, which he thought would have been an acceptable thing when so many men were kept at work, and so much money, as was duly paid, circulated about. But it had a contrary effect; it raised a great outcry against him." The sale of Dunkirk to the French for 400,000*l.* had taken place only three years before, and was still fresh in men's minds. The odium of this transaction fell chiefly on Lord Clarendon, who was accused of pocketing a share of its profits, and the people gave the name of Dunkirk House to his new mansion. Others called it Holland House, thereby insinuating that it was built with bribes received from the Dutch, with whom this country then waged a disastrous war. In spite of popular outcry, however, the house was completed in 1667, the year of Clarendon's disgrace and banishment. Fifteen years later, after his death, his heir sold the place to the Duke of Albemarle for 25,000*l.*, just half what it cost, and the duke parted with it for 10,000*l.* more. Finally it was pulled down to make room for Albemarle and Stafford Streets, of which latter, as appears from old plans of London, the centre of Clarendon House occupied the entire site.

Correspondence

Hull Central Library Competition.

SIR,—The present mode of forwarding designs, without motto or distinguishing mark, has some disadvantages, as I have experienced in this instance. With my plans another competitor's report has been returned. They all bear the same number, put on by the same hand. I have complained to the town clerk, but he repudiates all responsibility, and declares the alteration "was certainly not made by anyone in my office." It is too bad that competitors should be the victims of such carelessness. May I ask, with your kind indulgence, the competitor who has mine to exchange reports with me?—Yours faithfully, A. H. GOODALL.

14 Market Street, Nottingham:
January 30, 1899.

GENERAL.

Mr. Stanhope Forbes has completed his wall painting for the Royal Exchange. The subject is the *Great Fire of London.*

The Late Adolphe d'Ennery, the French dramatist, who died last week in his eighty-seventh year, it is understood has left the greater part of his fortune for the erection and support of a hospital and asylum for actors.

Mr. S. W. Williams, architect, has resigned the county surveyorship of Radnor, which he held for thirty-five years.

The Lectures for sanitary officers at the Sanitary Institute will commence on the 20th inst. with one by Professor Corfield. Mr. E. T. Hall, architect, will lecture upon "Sanitary Building Construction" on April 10.

The Late Mr. James Murray, architect, of Portman Street, W., has left property of the value of 24,599*l.* 13*s.* 5*d.*

M. Lucien Magne, architect and professor in the Ecole des Beaux-Arts, has received the appointment of professor of art in its application to industry at the Conservatoire National des Arts et Métiers, Paris.

A New Church is to be erected in Mortimer Road, Kensal Rise, by the Vaughan Memorial Committee. It will accommodate 750 worshippers, and the cost will be 7,500*l.* Messrs. Cutts are the architects.

The Joint Committee of Surrey and Middlesex having recommended that the new Kew Bridge should be widened to the extent of 10 feet beyond the 45 feet originally designed, at an additional cost approximating to 24,000*l.*, the report has been adopted.

An Exhibition of Painting and Sculpture was opened in the Palace of Art, Monte Carlo, on Saturday last. It has been organised by M. Georges de Dramard, the French painter.

M. Robert de Mols, the Belgian painter, some of whose decorative works have appeared in *The Architect,* has been nominated a chevalier of the French Legion of Honour.

The Trustees of the National Gallery last year purchased two pictures by Rembrandt, known as the *Burgomaster and his Wife,* from Lord de Saumarez, which it was afterwards found could only be effected by permission of the Court of Chancery. By a decision of the Court the sale has since been approved, and the pictures are placed in the large Dutch room.

Mr. Alexander Lang Elder has presented to the National Gallery a picture of the Spanish School, *Christ disputing with the Doctors,* by Francisco de Herrera the elder.

The Fifth Ordinary Meeting of the Liverpool Architectural Society will be held at the Law Library, 41 Castle Street, on Monday next, the 6th inst., at 6 P.M., when a paper will be read by E. Prioleau Warren on "Ideals and Realities of Modern Practice."

The Annual Meeting of the Royal Cambrian Academy of Art was held on Saturday at Conway, under the presidency of Mr. Clarence White. The new associates elected were Mr. Lester Sutcliffe, Leeds; Mr. Booth, Manchester; and Mr. Alyn Williams, London. It was resolved to have another open exhibition this year.

THE
Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to rise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, Imperial Buildings, Ludgate Circus, London, E.C.

For Advertisement Scale, see page xiii.

COMPETITION OPEN.

BRADFORD.—April 14.—Designs will be invited for the erection of the Bradford Corporation Cartwright Memorial Hall, at a cost of 38,000*l.* Three prizes will be offered, value 200*l.*, 100*l.* and 50*l.* respectively. Particulars will be found in another column.

CONTRACTS OPEN.

ANGLESEY.—Feb 6.—For extensions to the Welsh C. M. chapel at Benllech. Mrs. Jos. Owen, architect, Menai Bridge.

ASHTON-UNDER-LYNE.—For additions to New Jerusalem schools. Messrs. J. H. Burton & J. A. Percival, architects, 150A Stamford Street, Ashton-under-Lyne.

BARNET.—Feb. 8.—For erection of mortuary near infirmary. Mr. Geo. D. Byfield, 16 High Street, Barnet.

BARNSLEY.—Feb 8.—For alterations and additions to Hollowgates, Sackville Street. Mr. Herbert Crawshaw, architect, 13 Regent Street, Barnsley.

BIGSWEIR.—Feb. 7.—For erection of a cottage at Whitebrook level crossing, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station.

BLACKBURN.—Feb. 10.—For erection of cattle lairs at the Corporation abattoirs, Sumner Street. Mr. William Stubbs, borough engineer, Victoria Street, Blackburn.

BLACKWOOD.—Feb 8.—For erection of a villa. Mr. Thomas Rowland, architect, Market Buildings, Pontypridd.

BRADFORD.—Feb 7.—For erection of engine-house, mortar-pan shed, lime store, weigh-house, &c., at Sunbridge Road destructor works. Mr. J. H. Cox, city surveyor, Town Hall, Bradford.

BRADFORD.—Feb. 9.—For erection of a store in Manningham Lane. Messrs. Rycroft & Firth, architects, Bank Buildings, Manchester Road, Bradford.

BRENTFORD.—Feb. 8.—For erection of a vestry hall in the Half Acre, Old Brentford. Mr. James W. Tidy, vestry clerk, 301 High Street, Old Brentford.

CARDIFF.—Feb. 9.—For additions to Clifton Street Chapel. Messrs. Habershon, Fawckner & Groves, architects, Pearl Street, Cardiff.

CARDIFF.—Feb. 11.—For extension of the mortuary at the workhouse. Mr. Edwin Seward, architect.

CARLISLE.—Feb. 10.—For erection of a dwelling-house stable, &c., Wigton Road. Mr. A. W. Johnston, architect, 81 Castle Street, Carlisle.

CHIPPENHAM.—Feb. 7.—For alterations and additions to the passenger station and for other works, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station, London.

CORNWALL.—Feb. 11.—For erection of farm-house at Brynn, one mile from Victoria Station, on the Newquay line Mr. Sampson Hill, architect, Redruth.

CHESHIRE.—Feb. 13.—For erection of Central Hospital, Liscard Road, Liscard. Messrs. Maxwell & Tuke, architects, 41 Corporation Street, Manchester.

DEWSBURY.—For erection of two shops and dwelling-houses in Halifax Road. Mr. F. W. Ridgway, architect, Dewsbury.

DORCHESTER.—Feb. 10.—For erection of a hall and two dwelling-houses in Charles Street. Mr. A. L. T. Tilley, architect, 26 South Street, Dorchester.

DOVER.—Feb. 21.—For construction of a public convenience and an addition to the museum at Gaol Lane. Mr. Henry E. Stilgoe, engineer, Town Hall, Dover.

DUBLIN.—Feb. 8.—For erection of six labourers' dwellings as follows:—two to be erected in the townland of Blanchardstown, and four upon a plot of ground at Ballycoolen, all in the electoral division of Blanchardstown. Mr. John O'Neill, clerk, Board Room, North Brunswick Street, Dublin.

DURHAM.—For erection of block of buildings at Annfield Plain. Mr. T. E. Crossling, architect, Stanley.

STURTEVANT SYSTEM
OF WARMING AND VENTILATING.
POSITIVE CIRCULATION OF PURE WARM AIR. NO RISK OF FIRE.
PERFECT CONTROL OF TEMPERATURE.
STURTEVANT ENGINEERING CO., 75 QUEEN VICTORIA ST., LONDON.

EARLSHEATON.—For alterations to High Close. Mr. F. W. Ridgway, architect, &c., Borough Chambers, Dewsbury.

EARLSHEATON.—For extension of weaving sheds. Mr. F. W. Ridgway, architect, Borough Chambers, Dewsbury.

EASTBOURNE.—Feb. 11.—For construction of a public convenience on the Grand Parade. Mr. R. M. Gloyne, engineer, Town Hall, Eastbourne.

EXMOUTH.—Feb. 9.—For erection of four shops and houses opposite the railway station. Mr. Philip Kerley, architect, Exmouth.

FLETTON.—Feb. 6-24.—For erection of three new shops with storeroom over, at Fletton, Peterborough. Messrs. Townsend & Fordham, architects, Cross Street, Peterborough.

FORDINGBRIDGE.—For alterations and additions to Napier Villa. Mr. F. Bath, architect, Salisbury.

FULHAM.—Feb. 8.—For erection of destructor and boiler-house, engine-room, offices and workshops, and disinfector house in Town Mead Road. Mr. Charles Botterill, surveyor, Town Hall, Walham Green, S.W.

GLASGOW.—March 15.—For construction of buildings in Kelvingrove Park, Glasgow, for the Glasgow International Exhibition, 1901. Mr. H. A. Hedley, general manager and secretary, 141 Buchanan Street, Glasgow.

GORTON.—Feb. 22.—For alterations and additions to buildings at the sewage outfall works in connection with the erection of sludge-pressing plant, &c. Mr. Charles J. Lomax, engineer, 37 Cross Street, Manchester.

HALIFAX.—Feb. 7.—For erection of seventeen houses at Haugh Shaw. Mr. Medley Hall, architect, 29 Northgate, Halifax.

HALIFAX.—Feb. 7.—For erection of a new bridge over Godley Road. Mr. Edward R. S. Escott, borough engineer, Town Hall, Halifax.

HARPENDEN.—Feb. 8.—For converting the old British school buildings into public hall and offices. Mr. Frederick Eyles, Harpenden.

HASTINGS.—Feb. 16.—For erection of workhouse buildings in Cackle Street. Messrs. Jeffery & Skiller, architects, 5 Havelock Road, Hastings.

HIGHAM FERRERS.—For erection of three dwelling-houses. Mr. H. Adnitt, architect, High Street, Rushden.

HOLBECK, YORKS.—For building 35 yards chimney. Mr. Fredk. W. Rhodes, architect, Upper Wortley, Leeds.

HOLBECK, YORKS.—For erection of public shelter on Holbeck Moor. Mr. Fredk. W. Rhodes, architect, Upper Wortley.

HUDDERSFIELD.—Feb. 16.—For alterations and additions to the Huddersfield Orphan Home, Fitzwilliam Street and William Street. Messrs. John Kirk & Sons, architects, Huddersfield.

HULL.—Feb. 8.—For electric-light wiring and fittings for the tramways power station, Osborne Street (the contract includes four arc lamps and about forty incandescent lamps). Mr. A. S. Barnard, city electrical engineer, Dagger Lane, Hull.

HULL.—Feb. 8.—For erection of five cottages in Hawthorne Avenue, for the North-Eastern Railway Company. Mr. William Bell, the company's architect, York.

ILLINGWORTH.—Feb. 15.—For erection of stables, cart-shed, and store-room. Mr. Medley Hall, architect, 29 Northgate, Halifax.

IPSWICH.—Feb. 20.—For erecting conveniences and making additions to upper lodge at cemetery. Mr. Henry J. Wright, architect, 4 Museum Street, Ipswich.

IRELAND.—Feb. 9.—For reconstruction of a house at Crosshaven for a dispensary. Mr. R. Evans, engineer, 53 South Mall, Cork.

IRELAND.—Feb. 10.—For additions to and alterations in the infirmary at Enniskillen. Mr. C. Wilson, registrar, Enniskillen.

KENDAL.—Feb. 10.—For erection of villa residence at foot of Arnside Knott. Mr. John Stalker, architect, Kendal.

KILBURN.—Feb. 14.—For extension of public offices in Dyne Road. Mr. O. Claude Robson, engineer, Public Offices, Dyne Road, Kilburn, N.W.

KINGSTON-UPON-THAMES.—Feb. 14.—For provision of telephonic communication between the various buildings upon the workhouse premises. Mr. W. H. Hope, architect, Union Offices, Kingston.

KNARESBOROUGH.—Feb. 22.—For erection of school buildings and headmaster's house. Messrs. Barrowcliffe & Allcock, architects, Mill Street, Loughborough.

LEEDS.—For erection of a house, Crossgates, near station. Plans, specification and quantities at 38 Belle Vue Road, Leeds.

Architects and others interested should inquire as to this before specifying for New Work.

ASPINALL'S ENAMEL, LIMITED.
NEW CROSS, LONDON, S.E.

ELECTRIC NOTES.

THE Birkenhead Town Council has decided to apply for a license to supply electricity for lighting and other purposes to the townships of Bidston-cum-Ford and Noctorum, outside the borough boundary.

THE electric engineer of the Glasgow Corporation has been empowered to expend between 50,000*l.* and 60,000*l.* for electric mains and feeders extension in the streets, for which wayleaves have recently been obtained.

AT a meeting of the Crewe Town Council, held on February 1, it was resolved to apply for a loan of 26,000*l.* for the erection of a generating station and plant for the supply of electricity for lighting and motor power.

THE Newcastle-on-Tyne Electric Supply Company is considering the question of supplying continuous current for power work throughout its district, and has already entered into a contract to supply the current for driving an electric passenger lift, ventilating fans, &c., in the new Shaftesbury Buildings now in course of erection. It is also to supply current for over 500 incandescent lamps, with which the new range of buildings are to be lighted.

THERE have been several postponements of the time for installing the electric light at the Citadel Station, Carlisle, but preparations for the event are well advanced, and the final "switching on" of the new light may be expected shortly. One night last week all the arc lamps were turned on experimentally for some hours, and every night since some of the circuits have been in operation. All these experiments have been made with the view of perfecting the system. There are two arc lamps still to be erected in Court Square.

THE electric-lighting committee of the Edinburgh Town Council, at a meeting on the 30th ult., agreed to recommend the Council to purchase ground belonging to the North British Railway Company in the vicinity of Dewar Place electric-lighting station, so that accommodation may be had for additions to the boiler-power and for other new plant. The cost of the ground and of the properties on it is about 15,000*l.*, and it is understood that, as a result of the addition to the station, the committee will be able to make arrangements which will obviate altogether the smoke nuisance, in regard to which there have been complaints by residents in the locality. The committee further agreed to recommend the Town Council to extend the water storage at a cost of 550*l.*; to extend the storage batteries at a cost of 1,500*l.*; and to spend on repairs to the existing batteries 700*l.*

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied their patent Manchester stoves, with descending smoke flues, to the Billericay Union Infirmary, Essex.

MR. HENRY SELL has published a new edition of his invaluable "Directory of Registered Telegraphic Addresses." It comprises information received from the Post Office up to January 1. There is a classified business directory.

THE Ton boys' and girls' school, for the Rhondda School Board, are being ventilated by means of Mackay's patent "climax" ventilators, supplied by Messrs. Cousland & Mackay, 150 Hope Street, Glasgow. The architect is Mr. Rees, of Pentre, and the contractor, Mr. A. Richards, of Rhondda.

THE Derryloran Male and Female National Schools, Cookstown, co. Tyrone, Ireland, and the Public Buildings, Ookiep, Port Nolloth, South Africa, have been ventilated throughout on the "Grahtryx" system of ventilation, supplied by the Grahtryx Ventilating & Engineering Co., Limited (successors to Baird, Thompson & Co., Limited), 23 Sutterton Street, Caledonian Road, London, N., and at Glasgow.

"THE SURVEYOR" EXHIBITION, which will be held in connection with the forthcoming Building Trades Exhibition, will present a variety of road-making methods and appliances. The executive committee consists of Messrs. Patten Barber, C. H. Cooper, E. J. Lovegrove and O. Claude Robson. There is likely to be an interesting display which will attract municipal engineers.

MR. A. ROBINSON, of 25 Marsham Street, S.W., sends us a price list of some of his specialties in sanitary appliances, consisting of valve-closets, water waste-preventers, cisterns, tanks, &c. Among the illustrations we may specially mention that of his washdown closet and trap in one piece, County Council pattern, P or S trap, with Robinson's water waste preventer, cast-iron cistern, fitted with copper syphon, ½-inch ball

VARIETIES.

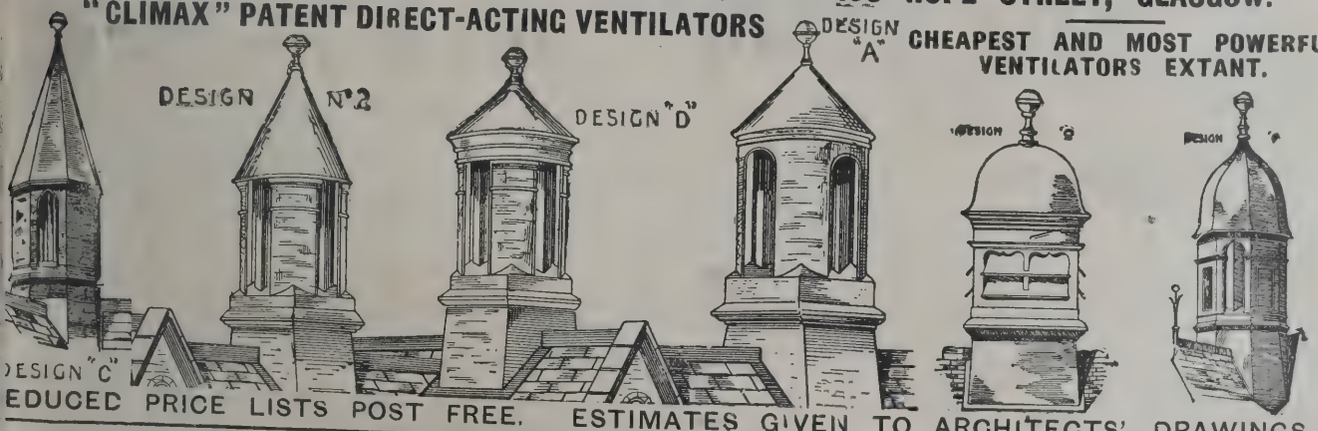
THE first Higher Grade School at Lancaster was opened recently by the Governors of the Old Blue Coat Girls' Charity, which was founded in 1772. The premises will accommodate about 100 girls, who will receive a technical education.

DURING the work of constructing the quay in the tidal basin at Ostend it was discovered that the wall of a caisson was resting on the hull of a ship which had been swallowed up, for many centuries probably. The hull will be cut through in order to continue the work and to examine the contents of the ship.

DURING a lecture on architecture the temperature of the room was very hot. Just as the heat was almost unbearable, the lecturer continued, "And now we will turn to Greece." "You're right," said one of the audience, who was freely perspiring, "we *shall* turn to grease if we don't have some of these windows opened."

THE ancient parish church of Keston, near Boston, has just been restored at a cost of about 4,000*l*. The church up to the end of last century was one of the finest in Lincolnshire. In 1800 the parishioners pulled down the grand central tower, and rebuilt a new one at the west end. Under the restoration just completed the ancient parts of the church have been restored and the chancel improved.

THE Strand Board of Works have resolved to oppose by petition to Parliament the London County Council's Bill for the making of a new street from Holborn to the Strand, terminating on the site of the Olympic Theatre, with two spur streets running east and west, and entering the Strand opposite St. Clement Danes' Church on the east and Wellington Street on the west.



A MEMORIAL has been presented to the Government urging them to deal with the registration of plumbers in the ensuing Session, in the interests of the public health. It is signed by over sixty members of Parliament, including Mr. J. Aird, Sir Henry Bemrose, Lord Hugh Cecil, Sir W. Hart Dyke, Sir H. S. King and the Marquis of Lorne. A separate memorial has been addressed to the Local Government Board signed on behalf of the Parliamentary Bills committee of the British Medical Association, the Manchester and Salford Sanitary Association, the Royal Institute of British Architects, the National Health Society, and the Royal Institute of Public Health.

THE Countess of Castellane, daughter of the late Jay Gould, has just moved into the palace in the Avenue du Bois de Boulogne, which has been in course of construction for several years. The stone employed is similar to that of the Arc de Triomphe, and the marble came from Italy. The great feature will be the ballroom, which occupies about a third of the area. This magnificent abode promises to be one of the sights of Paris. A few days ago the Countess entertained at dinner all the workmen who had been employed and their wives, whilst for their children there was a Christmas-tree groaning under presents, and a variety show. The men went away with their pockets full of cigars, and their wives with presents.

THE Recorder of London (Mr. Charles Hall, Q.C., M.P.) and a special jury sat at the Guildhall on the 30th ult. to hear the case of the Governors of St. Bartholomew's Hospital *v.* the Corporation of the City of London, which was a claim for about 20,000*l*. compensation in respect of the acquisition of about 1,078 superficial feet of land, now forming part of the site of Nos. 90, 91, and 92 Fleet Street and St. Bride's Avenue, required for the purposes of widening Fleet Street. The jury viewed the premises, and on their return to court Mr. Cripps, Q.C, who, with Mr. James Fox, appeared for the claimants, stated that an agreement had been arrived at. The jury would be asked to give a verdict by consent for 16,000*l*. and taxed costs.

A MEETING of the Architectural Section of the Philosophical Society of Glasgow was held on the 30th ult. in the rooms, 207 Bath Street, Glasgow. Mr. P. Macgregor Chalmers presided. Mr. Edwin Forbes, Edinburgh, read a paper on "Architecture in Galloway," which, he said, was a record of his own work as a student of the Edinburgh School of Applied Art. In the course of the lecture he dealt with Sweetheart, Dundrennan, and Glenluce Abbeys, and Caerlaverock Castle, in addition to a number of minor domestic keeps and castles. One could not, he said, get finer and simpler specimens of Gothic architecture anywhere than in the South of Scotland, where a great revival took place in the beginning or early in the twelfth century.

The new parish church at Handforth has now been completed, and the Bishop of Chester has arranged to conduct the opening ceremony early in March. The church has been erected on land near the old structure. The work was entered upon in the Jubilee year. The building is in the Perpendicular style of architecture, with "half-timber" gables and other details characteristic of the buildings of Cheshire. The walls are of brick, with Alderley stone dressings to the windows, doorways and buttresses, and the roof is covered with Broseley tiles. It is proposed to add a tower, transepts and vestries later on, and when the entire scheme has been carried out there will be about 300 sittings. The scheme will involve an outlay of about 3,000*l.* The old church is now to be taken down, and the land is to be added to the burial-ground.

The Great Western Railway at Cefn Bychan, Ruabon, has been greatly damaged, owing to the subsidence of an embankment extending from 20 to 30 yards in length. When discovered, the rails were hanging in mid-air, and both passenger and goods traffic have been greatly impeded. A house recently built for the stationmaster has collapsed, and yesterday a gang of men were engaged in clearing the débris and preparing the line for traffic. The whole of the damage is estimated at 1,000*l.* It is stated that the line in this part has been constructed on quicksand, and a similar accident occurred at the place about three years ago. It is also in close proximity to the river Dee, which flooded this point very much recently.

An accident of a somewhat peculiar nature occurred in Kirkman Place, Tottenham Court Road, on the 30th ult., some 10 feet of pavement suddenly collapsing about half-past three o'clock. Underneath the pavement are a series of vaults running on both sides of Kirkman Place, and it was the roof of the vaults on the left-hand side, entering from Tottenham Court Road, that gave way. On the right-hand side hoarding had long been erected in view of the fact that a house had been removed to make room for the extension of Tottenham Court Road police station. For a considerable period the interior of the vaults and their supports had been in a bad condition. The pavement suddenly collapsed and left a gap 10 feet by 6. Fortunately no one was seriously injured, although one workman's arm was slightly hurt. Mr. W. Davies (foreman of works) and the clerk of works to the Metropolitan Police (Mr. Ham) had rather narrow escapes.

Bradford may be congratulated on the handsome theatre with which it has been provided, and which is to be known as The Empire Palace. The building was formerly the Alexandra Hotel. The frontage is of an imposing character, and the hall has been converted into a grand crush-room. The house is a two-tiered one, but on the second-circle level a gallery is set up, thus making three tiers. There is no wood in the construction, concrete and steel being used. Electric light is to be used, with gas in reserve; and a feature of the auditorium is six lanterns, in keeping with the arabesque decorations. The auditorium is 60 feet wide and 80 feet from the curtain-line to the back rows in the pit. The capacity of the house is about 3,000. There are thirteen means of exit, and in case of fire the place could be rapidly emptied. There is a low-pressure system of hot-water heating, and a hydrant for each tier, together with a double asbestos curtain, which can be worked by one man. The grid is 60 feet above the stage level, and is fitted up with the most modern appliances. The cost, in addition to that of the old building, has been about 30,000*l.*

East Parade Chapel, Leeds, having been found somewhat inaccessibly situated as regards the majority of its worshippers, it has been decided to sell the site and erect a new chapel in a more convenient position, and an extraordinary meeting of the members was held recently in the schoolroom to consider a recommendation on the subject by the trustees. The Rev. Charles Lemoine presided. There was a large attendance, and great interest was taken in the proceedings. It was explained that sealed tenders had been invited by the trustees, and that in response an offer of 30,000*l.* had been received. This was submitted for acceptance, but as it was stated that an offer of 31,000*l.* had been subsequently sent in the meeting felt called upon to exercise its discretion in the matter. The result was that a proposal to give power to sell at 30,000*l.* was negatived. Another resolution was then submitted empowering the trustees to offer the premises for sale by public auction at an early date "with a view to the removal of the chapel to some position nearer the residences of the greater portion of the congregation," and subject to a reserve bid of 31,000*l.* This gave rise to a protracted discussion, but it was in the end carried by more than the requisite two-thirds majority—127 out of 160.

A Baptist church and schools are to be erected at Stockton, the church to accommodate 620 worshippers and the schools 300 children. The site has cost 850*l.*, and the building is estimated to cost 8,000*l.*

BUILDING AND BUILDERS.

IN connection with the annual meeting of the Scottish Master Painters' Association, the members of the body visited the Dundee Technical Institute on Saturday for the purpose of witnessing the competitive work forwarded by the apprentices in the various districts, and ascertaining the awards of the adjudicators.

THE threatened lock-out in the Norwich building trade has been averted. The dispute arose over a demand on the part of the bricklayers that builders' merchants supplying Broseley tiles should employ bricklayers and not slaters to place them in position. The masters have conceded this point, and the men withdrawn will return to work.

THE general purposes committee recommended that the plans and specifications should be prepared for carrying out extensions to the County Council Hall in the property acquired by the Council at the corner of St. Martin's Place, Stafford, at a cost of 7,000*l.* The chairman stated that more accommodation was required for committee meetings, and a room was also needed for the convenience of members.

THE ceremony of opening the new buildings of the new Hospital for Women in Euston Road, has been postponed owing to the new structure not being quite so near completion as had been anticipated. The internal arrangements still require some finishing touches, and it is hoped that the deferred ceremony, which will be postponed for a very brief period, will be fixed for a date which will make it convenient for the Bishop of London to carry out his wish to be present at the inauguration.

THE new Central Library for Hornsey, in Church Lane, is now nearly finished, and will shortly be opened for the use of parishioners, when building operations will be put in hand for the two branch libraries, to be erected in the Stapleton Hall Road, near Harringay Station, and on the Priory Gardens Estate, Highgate, adjoining the Great Northern station. These libraries will be completed during the next eighteen months.

A TERRIBLE accident occurred last week at Old Park Works, Wednesbury. Whilst a number of men were at work on a bridge to be sent to India the scaffolding gave way, and four men fell on to the girder, sustaining shocking injuries. William Plant was killed instantaneously, being nearly decapitated. John Humphries was removed to his home in a dying state, and the two others were removed to the hospital.

A LARGE staff of workmen are engaged rebuilding the west wing of Drummond Castle, the residence of the Earl and Countess of Ancaster. The portion of the castle referred to extends from the front turret entrance-door in the courtyard south towards the famous gardens. In this wing were formerly situated the staircase and dining-room, with eight or ten bedrooms, which have all been removed. A handsome new block of three storeys in height is being erected in its place, which also occupies a part of what was the courtyard near the garden entrance. The greater portion of the ground-floor of this new wing is to be occupied by a large dining-room and a new staircase, with windows looking into the gardens and courtyard. A new library is to be placed on the drawing-room floor above the dining-room, also looking on to the gardens; while the whole of the remainder of this floor and the top floor will be taken up with bedrooms. A fine and well-lighted new billiard-room has also been formed on the ground-floor. The new wing has been designed in the same style as the present castle, and with its handsome corbelled turrets on the south angle overlooking the gardens will form a new and imposing feature in the buildings as viewed from the gardens. The buildings adjoin the ancient Castle of Drummond, which dates from the fifteenth century.

FIRE-TESTING STATION.

THE British Fire-prevention Committee, which was founded by Mr. Edwin O. Sachs, after the Cripplegate fire, to promote the purposes generally indicated by its name, has established on the banks of the Regent's Canal, near St. John's Wood Road Station, a fire-testing station which is probably unique of its kind, and of which a private view was afforded to a party of interested spectators on Tuesday last. Its object is to test various materials and systems of construction used in building practice, so as to obtain trustworthy information respecting the resistance they offer to fire. What information of this sort is at present available is, with few exceptions, the result of inquiries carried on by makers or inventors, and therefore cannot claim the authority attaching to independent investigations. At this station the tests are to be made by independent experts, who in their reports will state nothing but the bare facts, anything like expressions of opinion or criticisms being rigorously excluded. Moreover, anyone who submits an article or device to be

tested must bind himself not to publish, or allow to be published, any account of the results except the duly authenticated official report of the committee without abbreviation With these precautions to obtain simple facts free from bias of any kind, the tests applied are to be arranged on scientific lines, though with due regard to the practical purposes in view, and to be taken with such instruments as to secure trustworthy data. They are to be under the superintendence of the members of the council of the committee, and their general arrangement is to be settled by the executive in accordance with definite principles laid down after careful study and experiment For "full-size" tests, brick huts in the garden of the institution will be used; in these, temperatures up to 3,000 deg. can be realised by means of a water-gas installation, readings being taken by automatic electrical pyrometers, and pictures of the condition of things inside the huts by photography. The expenses of establishing the station have been met by a special subscription, by which also the costs of conducting tests of general technical interest will be defrayed. Inventors or manufacturers must, however, pay for the tests they require, though the charges are so calculated as only to cover the actual cost of the investigation.

The object under investigation on the occasion in question was an ordinary pugged floor, which would meet with the requirements of the Building Act, the specification being drafted by Mr. Woodthorpe, M A, F.R.I.B.A., district surveyor for the City of London (Northern division), which includes the recently destroyed Cripplegate area. Three variations of pugging were used with wood joists.

The floor was built in the ordinary way over the testing-chamber, and had been given six weeks to dry. The test applied was a fire test of an hour's duration, at temperatures varying from 1,800 degrees to 2,300 degrees Fahrenheit, followed by the application of water under 40 lbs. pressure from a manual engine for 1 minute and 30 seconds. No load was put on the floor, nor had it to withstand the shocks of falling weights.

The general arrangements were in the hands of a sub-committee of the executive, with Mr. Edwin O. Sachs (chairman) as directing member; Mr. Max Clarke, A.R.I.B.A, who was so prominently associated with the brickwork tests of the Royal Institute of British Architects, having charge of the actual testing-chamber, and Mr. Wordingham, A.M.Inst.C.E. (the electrical engineer of Manchester), having control of the instruments Mr. Charles E. Goad, M Am.Soc.C.E., the insurance surveyor, and Mr. Woodthorpe, the district surveyor, assisted.

Mr. Monckton, the secretary, and the staff of the committee and the superintendent of the station were in attendance, and the appliances were all handled by skilled mechanics provided by the contractors or instrument makers respectively.

The arrangement of the work was in the hands of a sub-committee of the executive, comprising Mr. Frederic R. Farrow, F.R.I.B.A, Mr. Max Clarke, A.R I.B.A., and Mr. Robert Mond, M.A., F.R.S.E.

The appointment of superintendent of the station is held by Mr. Thomas Kissack.

ELECTRIC TIMBER-SEASONING.

By this term is signified one of the most remarkable inventions of this age, prolific as it has been in the fruits of inventive genius in almost every direction. For, although electricity has been successfully employed in a good many ways and for a good many different purposes, though it is in daily use as an illuminant, as a culinary agent, as a source of power, as a curative in disease, and in other ways, it would hardly have seemed probable that it could be used as a means of preserving and seasoning timber. Yet this has been and is daily being done, and by a process which, as we shall show, is very simple, as well as being marvellously effective.

In order to learn the exact nature of this process and to inspect the results which are achieved thereby, we on Wednesday last paid a visit to the works of Messrs. Johnson & Phillips, at Charlton, wherein the new method of seasoning wood was

TO ARCHITECTS, SURVEYORS, &c.

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent"), having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

CHING'S Patent Mica Valve Chimney Breast Ventilator, or
CHING'S New Patent Silent Chimney Breast Ventilator.

TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM.

being exhibited. Anything very much less striking in appearance than the apparatus employed could hardly be imagined, for all which there was to see was a large rectangular tank partly full of water, in which there apparently reposed a heavy body, and to which tank was fitted an electric lead. A very brief examination, however, served to show that in this tank there was in operation one of the most extraordinary processes ever seen or effected.

The tank is of wood, and is placed on insulating feet, and in the lower part is a solution called "Bororesinate de Soude." In the bottom of the tank are steam coils, which serve to heat the solution to the required temperature, and at either end of the tank are the terminals of the electric wire with which the apparatus is fitted. The action is this. The wood being placed in the solution, the electric current passes through it, and as it does so, sucks the solution into the wood, driving out the sap, which it replaces with a solid matter which is insoluble and antiseptic. This done, the wood is taken out and allowed to dry either in the open air or by artificial means, as may be preferred or most convenient. When dry the wood is not only thoroughly seasoned—that is, deprived of the sap—but charged with matter which preserves it against moisture, decay, the ravages of insects and all other deleterious influences.

Nor is this all. Should it be desired to stain the wood all that is necessary is to add to the solution the required colouring agent, when that also will be sucked into the wood and colour it permanently and in every fibre.

This, in its broad outlines, is the process of electric timber-seasoning, and the many advantages which it secures must be obvious. To begin with, it effects an enormous saving of expense, and that not only in direct outlay, but in sunk capital. For timber which now lies in a yard for fourteen years can be more thoroughly seasoned in less than as many days. Then every builder or worker in wood can season his own timber, all that is necessary being the tank, the solution, and a supply of electricity—three necessities quite easily obtained. Moreover, the electric power required is but about 110 volts.

The advantage of the electric seasoning is manifest also in its superiority over all other systems. Drying by heat is never absolutely perfect besides being extremely costly, while injections are equally unsatisfactory and expensive, added to which both processes tend to weaken and injure the wood. The electric system, on the contrary, not only effects no injury but imparts increased strength.

The system, which has been thus briefly described, is known as the "Nodon-Bretonneau" process, and has proved an enormous success in France, so much so, indeed, that the company which was formed to work it has sufficient orders in hand to last over the next two years, and this although the works were only opened in November last. A company has now been formed in this country for the same purpose. It is called the Electric Timber-Seasoning and Preservation Company, with offices at 159 Victoria Street, Westminster, and convenient and extensive works at Charlton in Kent, close to the Thames, and the Charlton Station of the South Eastern Railway. That there lies before the company a splendid future no one who has seen the process and its results can doubt for a moment.

ACQUIREMENT OF PART OF PREMISES.

A COMPENSATION case, Hoye *v.* The Fulham Vestry, was tried before Mr. Loveland Loveland, deputy chairman of the Middlesex Sessions, at the Sessions House, Clerkenwell, on the 28th ult. It was one under Michael Angelo Taylor's Act, whereby power is given to acquire a portion only of a person's premises without taking the whole. In this case a slip of land 5 feet in width was taken from the entire frontage of the claimant's premises in Bagley Lane, adjoining the Queen Elizabeth Tavern. After the jury had viewed the premises the hearing of the case was resumed, when Mr. Klenck, of the firm of Messrs. J. M. Klenck & Co., Bishopsgate Street, City, E.C., auctioneers and surveyors, gave evidence for the claimant. He said the valuation for the present injury to the premises was £217. This was confirmed by Mr. J. H. Wheeler, of the firm of Messrs. Wheeler & Sons, Fulham Road.

After this evidence, the Vestry gave an undertaking to exonerate Mrs. Hoye from the cost of paving Bagley Lane in front of her premises, and agreed to reinstate the dwarf wall and fencing and the front wall of the stables, estimated at 80*l.*

The Vestry called to support their contention Mr. Charles Botterill, their surveyor, Mr. Boyden, of Fulham, and Mr. T. W. Biggs, of Clifford's Inn, who said there was no injury to the property, but that it would be a positive benefit to the same. In cross-examination one of the witnesses admitted it could not exceed 30*l.* After the summing-up of Mr. Loveland Loveland, the jury gave a verdict of 120*l.*, in addition to the vestry's undertaking in reference to the paving and reinstatement of the walls and fencing, which would make the verdict equal to 200*l.* The sealed offer of the Vestry was for 20*l.* only.

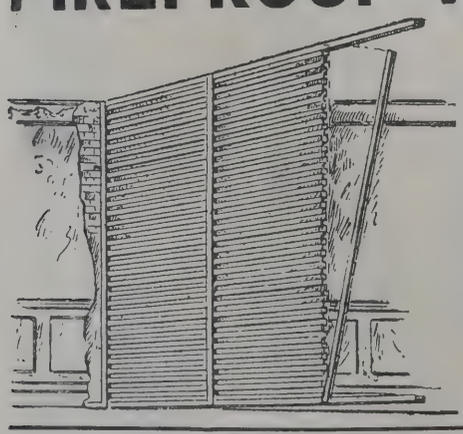
SOCIETY OF ARTS.

The following meetings have been arranged for February and March 1899:—February 1: Mr. Dixon H. Davies, "The Cost of Municipal Enterprise." February 6: Cantor Lecture, Dr. Samuel Rideal, "Bacterial Purification of Sewage." February 8: Mr. James Swinburne, "Nernst's Electric Lamp." February 9: (Indian Section), Colonel Richard Carnac Temple, "The Penal System at the Andamans" (this meeting will be held at the Imperial Institute, South Kensington). February 15: The Rev. John M. Bacon, "The Balloon as an Instrument of Scientific Research." February 20: Cantor Lecture, Mr. Archibald Sharp, "Cycle Construction and Design." February 21: (Applied Art Section), Mr. Cyril Davenport, "Vitreous Enamels." February 22: Mr. Philip Dawson, "Electric Traction and its application to Railway Work." February 27: Cantor Lecture, Mr. Archibald Sharp, "Cycle Construction and Design." February 28: (Foreign and Colonial Section), Mr. A. Hotz, "Persian Trade Routes." March 1: Mr. Wilton P. Rix, "Leadless Glazes." March 6: Cantor Lecture, Mr. Archibald Sharp, "Cycle Construction and Design." March 8: Mr. J. H. Collins, "Cornish Mines and Miners." March 9: (Indian Section), Mr. H. A. Acworth, "Leprosy in India" (this meeting will be held at the Imperial Institute). March 13: Cantor Lecture, Mr. Archibald Sharp, "Cycle Construction and Design." March 14: (Applied Art Section), Sir William Blake Richmond, "Craftsmanship and its place in a National Scheme of Art Culture." March 15: Sir Marcus Samuel, "Liquid Fuel." March 21: (Foreign and Colonial Section). March 22: Mr. Walter Hunter, "London's Water Supply."



THE MANCHESTER CITY SURVEYOR'S DEPARTMENT.

The special committee appointed by the town hall committee of the Manchester Corporation to inquire as to what changes might be necessary in the department of the city surveyor has concluded its labours. On November 28 last the committee resolved "that, in consequence of the growth of the city, the time has arrived when it is desirable to divide the work of the surveyor's office into two departments, and that the Lord Mayor be requested to confer with the city surveyor with a view to suggesting what arrangements will be most advantageous in the public interest." The rivers committee was also invited to state what arrangements they considered desirable in connection with the engineering and surveying work of their department. The rivers committee met on December 12, when it was resolved "that as the present requirements of the rivers committee are largely chemical, they contemplate relieving the city surveyor, and placing the general administration of the sewage works at Davyhulme under the control of their chemist (Mr. Fowler); Mr. Ogden, the manager of the Davyhulme works, to report as heretofore to the chairman of the committee, all reports being countersigned by Mr. Fowler, who will attend the meetings of the rivers committee as may be required." The rivers committee, on the same date, passed other resolutions to the effect that as the committee would require special engineering services, they proposed to confer from time to time with the city surveyor or any other engineers whom they desired to consult or entrust with the execution of any works. They also desired that an official paid directly by the rivers committee should be allocated to their work, and that as the city surveyor was unable to attend all their meetings, one of his assistants, competent and acquainted with the work, should be selected for the rivers business, who should have a special office provided by the committee, where all papers and plans connected with the department could be kept. The city surveyor will supervise the work of this office from time to time as may be desired by the rivers committee, and also be appealed to in all cases of accident or emergency on the works. It was also resolved by the rivers committee that all pending contracts should be dealt with and completed by the city surveyor. When these recommendations of the rivers committee were presented to the town hall committee they were confirmed in all their details. The town hall committee have also sanctioned the recommendations of the tramways committee whereby the tramways' engineering assistant will devote the whole of his time to the work of the committee, though acting under the control of the city surveyor.

On January 18 the Lord Mayor reported that, as authorised by the resolution of the sub-committee, he had conferred with the city surveyor with the view to suggesting what arrangements would be most advantageous in the public interest to be made in the surveyor's office, and had also had interviews with the officials of the department. With regard to the architectural department, the Lord Mayor found that Mr. Meek had

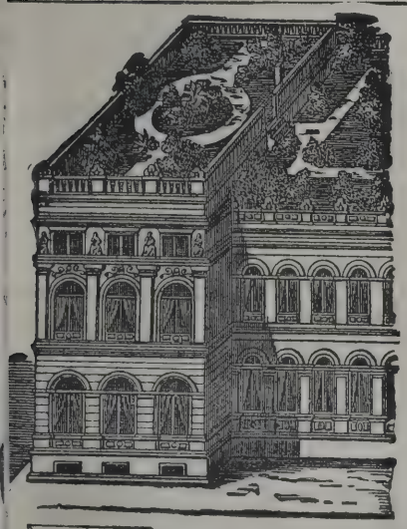
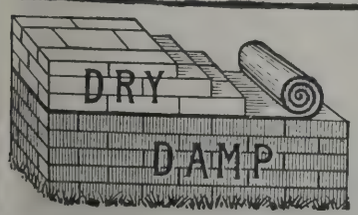
been *ad interim* in charge, in consequence of the desire expressed by Alderman Gibson during his mayoralty to that effect upon the resignation of Mr. Gibbons. The Lord Mayor (Councillor Vaudrey) considered that there should be a head of the architectural department, who would attend to the several committees and be responsible for all architectural work, and the plans and estimates in connection therewith. As, however, in many cases engineering questions would arise in connection with buildings, and communications had frequently to be made to the Local Government Board, the Lord Mayor did not think it desirable that the architectural department should be entirely severed from that of the city surveyor, but that the advice and assistance of the city surveyor should be available when necessary. Under these circumstances the chief architectural assistant will be the head of the staff of architectural employés, including those engaged in sanitary work, and his room will be entirely devoted to the work of that staff under his direction. As regards the quantity and measuring department, the Lord Mayor reported that it was necessary that a principal quantity surveyor should be appointed.

NATIONAL ASSOCIATION OF MASTER BUILDERS.

THE half-yearly meeting of the National Association of Master Builders was held on Tuesday at the Town Hall, Bradford. Mr. J. Stevenson Jones (Liverpool), the retiring president, was in the chair, and there were delegates from the principal cities and towns in the United Kingdom.



The annual report stated that disputes had been settled at Lancaster, Shrewsbury, Nottingham, Leicester, Bolton, Bristol and Reading. The improved state of the building trade throughout the country continued. To facilitate united action of the federated districts, the country had been divided into four national centres. During the past six months the secretary, acting on instructions from the Council, issued circulars to the principal local associations and centres in the United Kingdom asking for information on the apprentice question, to which about eighty-five replies were received. From these answers it appeared that limitation was very prevalent in the building trade. The figures showed that this ruled among masons in twenty-seven towns, bricklayers in twenty-six towns, plasterers in twenty-two towns, joiners in twenty-one towns, plumbers in twenty-one towns, painters in thirteen towns, and slaters in eight towns. There was no limitation in thirty-two towns. Steps were being taken by several local associations for the removal of this restriction, which was severely handicapping employers generally. It was hoped that, wherever practicable, all associations would take steps to remove this unfair restriction imposed by the operatives. The scarcity of labour in several branches of the building trade was causing great inconvenience, and the attention of members was drawn to the advisability of strenuously resisting the demand made by the operatives (which appeared to be a general one) to limit the number of apprentices; and in this connection the Association again earnestly recommended to its members the desirability of binding all apprentices by a legal indenture, in form similar to that passed and published by the Association for the use of its members. The balance sheet showed that the income had been 639*l.* and the expenditure 170*l.*, leaving a balance in hand of 465*l.*



The President, moving the adoption of the report, said the organisation was such that they might expect in the near future to have all the legitimate rights of employers—such as freedom of management, freedom of employment, and no limitation of apprentices. These they could now not only defend, but rigorously maintain throughout the country. There had not been for the past six months any serious strikes, but the aggressive manner adopted by some of the Trades Unions, particularly in respect to freedom of management and freedom of employment, was no longer bearable. The operative plasterers in London had struck against three employers because some of their men did not belong to the Trades Unions. Similarly aggressive conduct was reported throughout the country, and no doubt the Council would be called upon to adopt some policy which would check this tendency.

Mr. C. W. Green (Liverpool) seconded the motion.

Alderman Holdsworth (Bradford) was elected president on the motion of the retiring president, seconded by Alderman Bowen, and supported by Alderman Jessop. In returning thanks he said he believed the Association was beginning a new life this year. He hoped that although it had been federated they would still remember that the Association was formed for defence and not for aggressive work. In this connection he mentioned the dispute with the Plasterers' Union in London, and said that they might feel sure that what prevailed in London to-day would be in the provinces to-morrow. He urged the necessity of moderation, and spoke strongly on the manner in which the men's unions limited the output of the individual workmen.

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

On the motion of Mr. Stanley G. Bird, seconded by Mr. W. Sapcote of Birmingham, the retiring president was thanked for his services.

Mr. W. Sapcote was elected senior vice-president, Mr. A. Krauss (Bristol) junior vice-president, Mr. C. W. Green (of Liverpool) hon. treasurer, and Mr. W. Shepherd and Mr. Greenwood (London) auditors.

Mr. W. Church (Bristol) moved a resolution limiting the power of the executive (or standing committee) to settling matters referred to them by the council.

Mr. W. Shepherd (London) seconded.

After a lengthened discussion, on the motion of Mr. Myers, an amendment was carried giving the committee power to act on matters of emergency arising between one council meeting and another.

The Secretary (Mr. J. A. Hassal) reported that replies had been received from all districts throughout the country signifying the agreement of each district to affiliation with the Federation.

On the subject of the formation of a Builders' Foremen's Society, the President intimated that there was not sufficient information of a definite nature to be brought before the meeting.

Mr. W. Cunliffe, Bolton, said he hoped the matter would be pushed on with the utmost energy at the Council's command. It was ridiculous that their foremen should be compelled to join the Operatives' Unions. Masters had a right to ask that they should be under the control of no one else but themselves. What the masters had to do was to provide for them another union, which would give them equal benefits with the Operatives' Union. He moved an amendment calling for every effort to be made in this direction.

Mr. W. Sapcote seconded, and the resolution was carried.

On the motion of Mr. W. Shepherd, seconded by Mr. Hardington, it was decided to subscribe ten guineas per annum to the Free Labour Association It was decided that the next meeting of the Association should be held at Plymouth.

The meeting was then made private in order to discuss the report of a sub-committee upon the disputes with the Plasterers' Unions. It was resolved, "That the Council inform the National Association of Operative Plasterers that in consequence of the hindrance to business and continued friction caused to the employers by the conduct of the members of the union, the National Association of Master Builders determine to call upon them to give an assurance that they will in future abstain from the objectionable practices set out in the printed circular of January 10. The Association further requests them to reply by January 14."

The principal clauses of the circular are as follows :—

1. (*a*) The persistent attempt to coerce foremen of plasterers or superintendents of plasterers' work into the membership of the National Association of Operative Plasterers; also (*b*) the threat to withdraw all members from the building firms employing such foremen or superintendents.

2. The limitation of apprentices.

3. (*a*) The practice of boycotting certain building firms and employers of plasterers in spite of the fact that such firms adhere to the rules agreed between the Master Builders' Associations and the National Association of Operative Plasterers. (*b*) The practice of printing and circulating among the members of the National Association of Operative Plasterers a list of such firms for whom they are forbidden under penalty to work.

4. The refusal to work on buildings where some of the workmen employed may not belong to a trades union.

5. (*a*) The refusal to accept the decision of the employer as to which workmen shall do certain work in cases where plasterers dispute with other trades as to their right to do such work. (*b*) The practice of withdrawing all their members when such work may not be placed in the plasterers' hands.

6. The objection to submit all trade disputes to discussion at a conference between employers and employed, with a view to arrive at an amicable settlement prior to any strike or withdrawal of workmen.

ASSESSMENT OF PUBLIC BUILDINGS.

The following statement has been prepared by the School Board for London for submission to the conference on assessment matters which is about to be held :—

The method most frequently adopted for assessing the annual value of public buildings (the use of which is usually limited to the public purposes for which they were erected) is to fix the gross value, or the rateable value, by a calculation of certain percentages on the value of the land and the value of the buildings. The theory is, that these percentages shall approximate to the interest, or return on his outlay, which an individual might be expected to obtain in the market in the

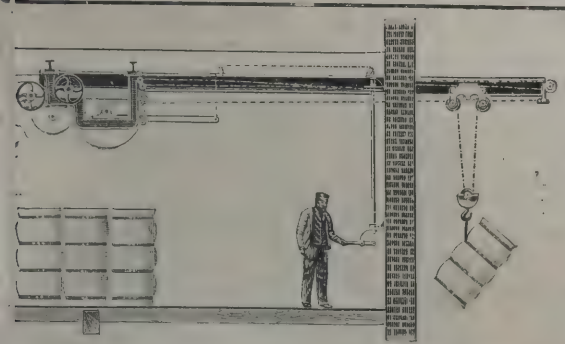
way of rent for such properties. The principle has thus been to some extent established that the annual value of public buildings is to be gauged by the profits accruing from buildings erected by private enterprise.

If, however, the conditions attending the acquisition and erection of properties by public bodies and by private individuals, respectively, be investigated, it will be seen that public work of this character is burdened by adverse circumstances and necessities from which private enterprise is free.

When public bodies seek to acquire land they are frequently hampered more or less by the necessity of complying with Acts of Parliament. They may, for example, be rigidly restricted in their choice of locality, and this restriction may be so far operative as to compel them to reject a cheap, and otherwise convenient, site merely because it happens that in one direction it is accessible only by crossing a main thoroughfare. A private individual has in general more freedom in this respect, and is concerned only to pay the lowest possible price. Having chosen their site, it is well known that a public body, especially when they purchase under compulsory powers, must give, on an average, at least 10 per cent. more for it than would be given by a private person. The publicity of their proceedings, and the deliberation with which they necessarily work, also militate against making "good bargains." The acts of a public body are open to public scrutiny, and the first suggestion to acquire a particular site may serve as a note of warning to the owner, who is then able, at his leisure, to exercise his ingenuity with a view to the ultimate presentation of his claims on the most remunerative scale. For a public body there is little opportunity for "striking while the iron is hot" in such matters; they have not the facility and swiftness of action which so often enable a private purchaser to negotiate with advantage.

Similarly, as regards buildings, public bodies are at a disadvantage, in the matter of outlay, as compared with private persons. Public buildings are of necessity more costly than such as are erected by private enterprise. The community demands in their construction a standard of excellence considerably above that which the private speculator commonly thinks it necessary to attain to. The sentiment of civic pride also calls for a degree of ornament and embellishment which would seldom be consistent with the objects of a private undertaking. A clock-tower, for example, which is a common feature of a public edifice, is not often judged to be necessary on private buildings; and many requisites of a modern public building, *e.g.* approaches, halls, staircases, corridors, reception-rooms, galleries, fittings, &c, must be on a scale which would be uncalled for and pretentious in an ordinary private, or even semi-private, building. It will not be contested that these forms of extra expenditure are not remunerative from the point of view of the speculator, who looks only to the return on his outlay, and would deem most, if not all, of them unprofitable and unnecessary.

It is evident that the operations of acquiring land and erecting buildings are more costly for public bodies than for private individuals. An individual works more cheaply, mainly because his only aim is to obtain an adequate return for his outlay, and he brings into existence with a minimum of expenditure a property which will suffice to give him this result. But the aims of public bodies cannot be so circumscribed; they must not discriminate too closely as to whether expenditure is profitable or otherwise, in the commercial sense of the word, and they are bound to consider and provide for many public needs and wants, the meeting of which is not compatible with an adequate return on outlay as understood by a private speculator.



The conclusion, therefore, cannot be resisted that the relation of capital value to annual value is rarely the same for public buildings and private buildings. A large proportion of the outlay on a public building is of a non-productive, or only partially productive, character, and the capital expenditure as a whole would not command so large an annual return in the market as would result from the same amount of capital expended on a private building.

It follows that the percentages on capital value which may be properly used for fixing the annual value of private buildings are in a high degree excessive, and produce unjust assessments, when applied to public buildings; and that the percentages employed to ascertain the annual value of public buildings should be considerably lower than those used in the case of private buildings.

Considerations of the above character apply with exceptional force in the case of the properties acquired and held by the School Board for London; and on this ground alone, and independently of other considerations pointing equally in the direction of low percentages, the Board claim that the rateable value of their schools and offices should not be calculated at more than 3 per cent. on the value of the land and the value of the buildings.

An additional argument in support of this claim is, in the opinion of the Board, afforded by the fact that they borrow

money, to provide for their capital expenditure, at rates of interest considerably less than 3 per cent. per annum. In 1896, in the course of the hearing of an appeal by the Board against the assessment of one of their schools, the then chairman of the London Quarter Sessions said: "How is it possible for us to exclude from consideration what the Board would be enabled to build similar premises for, themselves, and at what rate they would be able to get the money for the construction of such schools?" Whilst the Board do not put forward the contention that it would be fair or reasonable to measure the annual value of properties, whether public or private, solely according to the facilities for borrowing money, or the credit, enjoyed by the owners, they nevertheless consider that the matter has an important bearing in regard to certain classes of properties. They have in mind more particularly such properties as their own, where there is no tenancy, market, or competition to afford a guide to the true annual value. In such cases it may fairly and reasonably be assumed that the owners would not have built the properties themselves if they could have rented similar properties at less annual cost; and the interest they pay on the money borrowed for land and buildings therefore becomes an element in the consideration of the amount to be fixed as the annual value.

In 1894, in his judgment on the appeal of the London County Council *v.* Erith, in the case of the Crossness Outfall Works, Lord Herschell said:—"As to the method which ought to be followed when it is manifest that an owner would be willing to pay a higher rent than could be obtained from any other tenant . . . the whole of the circumstances and conditions under which the owner has become the occupier must be taken into consideration, and no higher rent must be fixed as the basis of assessment than that which it is believed the owner would really be willing to pay for the occupation of the premises." Again, in 1896 the then Chairman of the London Quarter Sessions stated, with reference to a Board school, that "the rateable value should depend upon the rent which the Board might reasonably be expected to pay as tenants of the school." Having regard to the character and dimensions of their school buildings, it appears to the Board that if such buildings were not their property, and if they were available for renting, then the Board would practically be the only possible tenants for them. A private person or body, or indeed any body other than a School Board, would find great difficulty in putting a Board school to profitable use, except perhaps on such low terms as to rent as would render them able to recoup themselves for a large outlay in adapting the building to their purposes. In any case, however, it is certain that the competition to rent such buildings would be very limited, and it is unlikely that anyone could be found who would be willing to give for the buildings, as they now stand, anything approaching the rent which the Board would be willing to give, and the result in all probability would be that the Board would obtain the premises on their own terms. Now these terms would certainly not amount to more than what the Board could acquire the land and erect the buildings for themselves. As stated above, the Board can, and do, borrow money for such purposes at rates of interest considerably less than 3 per cent. per annum, and they therefore consider that they are well within the mark when they contend that in no case would a higher rent be obtained than that which is represented by a rateable value calculated at 3 per cent. on the value of the land and buildings.

It is not to be understood, however, that the Board are claiming that they should have any undue advantage, or, in fact, that the schools should be assessed below their real value simply because they happen to be properties which would not be generally sought after if in the market. The Board are aware that they are liable to be regarded as hypothetical tenants, and that the value of the premises to them for their own purposes may be a factor in the consideration of the assessment. But it is precisely this view of the case which is met by their demand for assessment on the basis of 3 per cent. on the value of the land and buildings. The Board are strongly of opinion that not only would they be able to secure the schools, if for hire in the market, on the terms, or less than the terms, represented by a 3 per cent. rateable value, but that such terms would constitute a fair and honest rent. They cannot conceive that any of their schools could under any circumstances command a higher rent than that indicated by a rateable value calculated at 3 per cent. on the value of the land and buildings.

The Board have prepared the above statement in the conviction that the matters set out therein have an important bearing on the question of the proper method of assessing their schools and offices, and they believe that the conclusion they have come to in favour of the principle of 3 per cent. on the value of land and buildings for the rateable value is just and reasonable, and is fully supported by the above considerations. They have accordingly instructed their representatives at the conference to propose the adoption of the following regulation:—

PRICE LIST AND ESTIMATES ON APPLICATIO

"Public buildings (including workhouses, vestry halls, public libraries, schools, baths, washhouses, and hospitals) should be assessed at a rateable value calculated at 3 per cent. on the value of the land and the value of the buildings erected thereon."

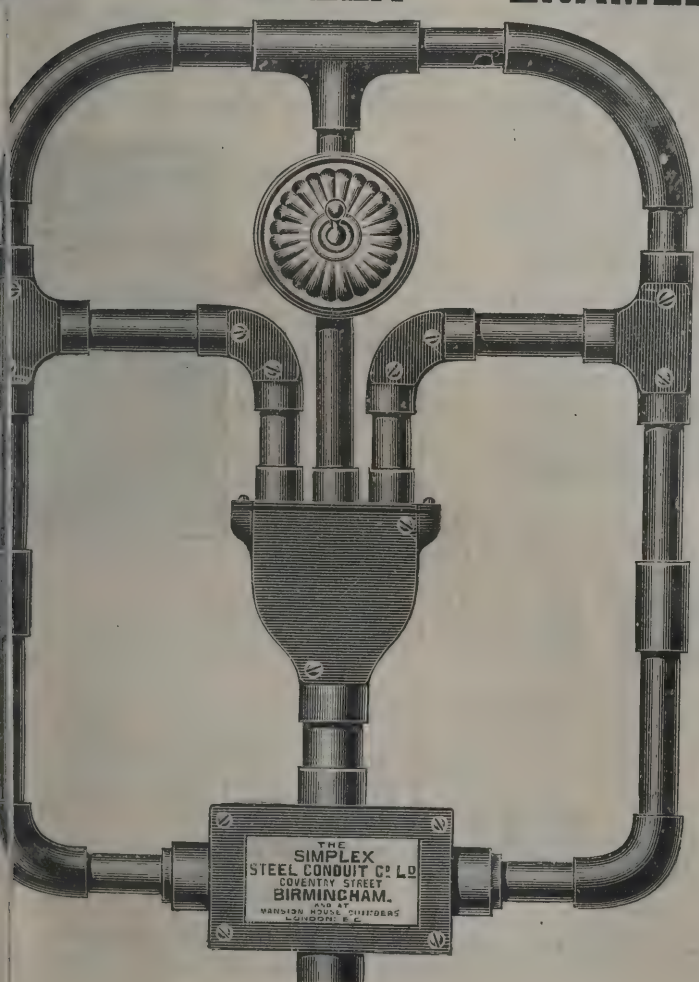
It will be observed that in the proposed regulation the Board have not endeavoured to afford any guide as to the construction to be placed upon the word "value" as applied to land and buildings. They venture to suggest that, on the whole, the word may be considered to be sufficient in itself to express what is meant to be conveyed, and that any attempt to define its meaning might be likely to defeat its object by introducing further material for discussion. The Board's considerable experience of the assessment authorities of the metropolis leads them to believe that those authorities may be trusted to place a fair and correct interpretation upon the word.

FLASH ADVERTISEMENTS.

AT the meeting of the London County Council on Tuesday the following memorial, signed by numerous architects, was presented :—

We desire respectfully to invite the attention of your honourable body to the practice, recently introduced and rapidly extending, of advertising in the public thoroughfares by means of large letters or other emblems illuminated by the electric light or gas. The architectural value of one of the most beautiful sites in Europe—Trafalgar Square—is thus nightly destroyed. We are aware that you have not at present any legal power of control, and our purpose is to suggest to you the expediency of applying to Parliament for such powers as may enable you to deal effectually with this and cognate abuses.

Some time ago an attempt was successfully made to throw advertising notices, by the aid of a search-light, on Nelson's Column The vestry of St. Martin's-in-the-Fields appealed to the Government, and the result was that this particular form of the practice was abandoned. In this special case public sentiment was affronted by the disrespect shown to the memory of a great naval commander ; but we believe that there is a feeling hardly less strong, and even more widely diffused, regarding the progressive degradation of the metropolis by the displays on private premises.



We submit that reasonable regard for individual liberty requires that those who wish to use public thoroughfares shall not be subjected to annoyance at the discretion of the owners of adjacent buildings. It must be for the duly-constituted local authorities to decide to what extent the appeal to the eye shall be permitted. In the absence of regulation the evil must indefinitely extend both in range and in offensiveness, for it is a maxim of puffing advertising that the more violent the attack on the sight the stronger is the impression left. If the proprietor of one preparation gains an advantage in this way his competitors will be forced in self-defence to neutralise his gain by setting up eyesores—if possible more aggressive—on their own account. Trade does not benefit in the long run, and the public suffer.

The fundamental issue, we submit, is whether the people of the metropolis are to be molested in the use of public thoroughfares ; whether the interest of the inhabitants of a great city in maintaining the dignity and beauty of its aspect is to be sacrificed to the rivalry of certain classes of tradesmen ; whether architecture and scenery are to be converted at the caprice of individuals into an insignificant background for the brawls of competing makers and vendors. In an age when so much is done at the general cost to improve the public taste and to provide art training, it is, to say the least, inconsistent to permit wanton disfigurements of our finest sites. Recent legislation (for London) regarding sky signs has checked one mischievous development, and has, we believe, caused general satisfaction, but the perverse ingenuity of advertisers has created a demand for the further extension of the principle of municipal regulation.

To prevent misapprehension let us add that we contemplate no interference with such methods of advertising as are either in themselves artistic or are consistent with dignity and propriety in the aspect of our city. The praiseworthy efforts recently made to improve posters would be encouraged by imposing a limit on the coarser modes of seeking publicity.

Even on mere grounds of safety to life and limb some of the illuminations must be pronounced most objectionable. The rapid alternation of flash and darkness is not only distressing and injurious to human eyesight, but must add greatly to the difficulties of drivers and pedestrians, especially in an open space with a network of crossings like Trafalgar Square. Nor can it be doubted that in some localities the vulgarising effect of these displays must tend to depreciate the value of property.

We desire to see enforced a principle of regulation which, while covering the case of illuminated signs, would necessarily apply to all advertising devices of a similar character, and would respectfully suggest that the simplest and most effectual method of restraining all the most offensive forms of advertisement would be absolutely to forbid the use of any letters exceeding a certain size or at more than a specified height above the ground level.

BUILDING RULES OF EDINBURGH.

The following are the regulations which have to be adopted when buildings are being erected in Edinburgh :—

1. The site of the intended building shall be dug out to such depth as shall, in the opinion of the Dean of Guild Court, be necessary for the removal therefrom of soil or refuse, and it shall not be lawful for any person to build upon any site until such soil or refuse is so removed and a proper foundation found.

2. The walls of every new building to be used as a dwelling-house shall have a damp course of durable material impervious to moisture ; the damp course for external walls to be at the level of the ground, or at such other level as the Dean of Guild Court shall order. Party walls to have the damp course not higher than the level of the under side of the joisting of the lowest floor, and where, in the judgment of the Dean of Guild Court, the nature of the soil or subsoil requires it, the whole internal area of the site shall be covered with a layer of asphalte, cement concrete, or other suitable material to their satisfaction. The street-floor level of dwelling-houses to be not less than 7 inches above the level of adjoining footpath, except with the approval of the Dean of Guild Court.

3. The outer walls, the party walls and the separate side or end walls and the timber and ironwork shall be of sufficient strength and stability, all to the satisfaction of the Dean of Guild Court.

4. No provision shall be made for the raising or lowering of any article from windows or openings towards any public streets by hoists or other appliances outside the building line without the consent of the magistrates and Council.

5. All party walls and gables shall be built solid, except at vents, fireplaces, presses and where the Dean of Guild Court allows them to be built otherwise.

6. All external walls, party walls, passage walls, partition walls dividing separate houses, staircases and the stairs of tenements of dwelling-houses shall be constructed with incombustible materials, and all party walls shall be carried through and above the roof to form a parapet, the parapet to be finished on top with a cope, and the height of parapet to be not less than 9 inches, measured at right angles with the slope of the roof, above the covering of the roof of the highest building to which such party wall belongs.

7. All walls of dwelling-houses shall be so constructed as to prevent damp.

8. The mortar to be used in the construction of new or altered buildings shall be composed of fresh-burnt lime and clean sharp pit sand, grit or ground bricks, or freestone shivers, without earthy matter, and in such proportion as to make good mortar to the satisfaction of the master of works.

9. The joists at every hearth shall be bridled, and the hearth shall be supported by a brick or concrete arch under its whole area, or be otherwise constructed or supported as the Dean of Guild Court may direct. Every fireplace in strapped walls shall have jambs and lintels or arches of incombustible material, coming forward at least to the flush of the plaster-work. No timber joist, beam or safety lintel shall be inserted into a wall nearer to the fireplace or vents than 9 inches, unless they are protected with a fireclay shield, in which case the insertion shall not be nearer to the fireplace or vents than 4½ inches.

10. No part of a built flue shall be less than 9 inches by 9 inches if square, or not less than 9 inches in diameter if circular. Every chimney head shall have a stone cope, extending the whole thickness of the stalk, with holes cut out in the solid, or cramped and closely joined in the centre, into which chimney cans can be inserted, and such chimney cans shall be sufficiently guarded. The inside of every flue must be rendered, pargetted or lined with fireclay lining.

11. All timber floors shall be carefully deafened ; the boarding inserted between the joists to carry the deafening material shall be securely affixed thereto and overlaid with a coating of lime mortar, on which, when dry, a layer of clean dry riddled engine ashes, or other suitable material, shall be spread, and the whole carefully finished and flushed with a surface covering of mortar. All voids between walls and contiguous joists shall be sufficiently deafened. The wooden flooring shall be well seasoned, and shall not be laid down until the deafening materials between joists and the whole plasterwork of walls be thoroughly dried. All voids behind skirtings shall be solidly

pugged with cement or other suitable material to the satisfaction of the Dean of Guild Court.

12. All apartments in every dwelling-house to be plastered shall receive three coats of plaster, or otherwise, to the satisfaction of the master of works.

13. All pipes connected with sanitary arrangements shall be ventilated and trapped, and all plumber-work constructed and tested to the satisfaction of the master of works.

14. Where any gas pipes are inserted for the supply of gas in any buildings, such pipes shall be of such dimensions as the magistrates and Council may consider sufficient to secure the proper lighting of such buildings.

15. All drains shall be laid as far as possible in straight lines, with oblique junctions, and with inspection shafts or access-chambers formed at angles and junctions so far as necessary, and shall have a fall where practicable of not less than 1 inch in every 40 inches. The joints shall be packed with Portland cement, or other suitable material, to the satisfaction of the master of works, and where the ground is soft or the drains pass through or under a house or building, such drains shall be encased in cement concrete at least 6 inches thick, or cast-iron pipes jointed with lead shall be used. All such drains shall be ventilated with not less than a 3-inch diameter cast-iron or other suitable pipe, carried up outside the building to a point clear of all windows or other openings, or they shall be otherwise ventilated and completed at the sight and to the satisfaction of the master of works.

16. All private courts, common passages and common areas (other than bleaching greens) shall be paved with stone or concrete, or such other material as the Dean of Guild Court shall approve, and be provided with proper and sufficient means for taking off the surface water.

17. When any tenement of houses is occupied by more than eight families, the open ground attached to such tenement shall be provided with such means of drainage and paved with cement concrete, or in such other way and manner, or with such other material, and to such extent, as may be approved by the Dean of Guild Court.

18. In all tenements in which the common staircase is lighted from the roof, the well-hole and roof-light of such staircase shall be of the following dimensions :—

In a tenement of three storeys in height the well-hole shall be of a superficial area of not less than 25 feet, and the roof-light not less than 120 feet. In a tenement of four storeys in height the well-hole shall be of a superficial area of not less than 30 feet, and the roof-light not less than 130 feet. In a tenement of five storeys in height the well-hole shall be of a superficial area of not less than 36 feet, and the roof-light not less than 140 feet.

WORKMEN'S COMPENSATION ACT.

IN the Brompton County Court a labourer named Rolfe sought to obtain from Mr. Henry Lovatt, builder and contractor, of Wolverhampton, the sum of 230*l.*, as compensation for injuries sustained, and said to have been caused through negligence for which the defendant was responsible. The plaintiff, having been engaged by the defendant as general labourer, was instructed by the timekeeper and material clerk, William Trudell, to assist in unloading and stacking some matchboarding and "skirting" in a passage, but was not shown how the boards were to be stacked. The boards had been piled up 7 or 8 feet when the stack fell down crushing him against the wall. Both his legs were broken, and he remained in hospital for twelve weeks, and afterwards attended as an out-patient for twenty-five weeks.

Corroborative evidence having been given, counsel for the defendant submitted that there was no case against his client.

His Honour: The question is whether there was negligence in taking an unskilled man to do the work. That must go to the jury.

For the defence Frederick Trudell, the timekeeper and material clerk, who instructed the plaintiff to assist in stacking the boards in question, said he considered it quite unnecessary to tell him how the work should be done. There were plenty of "ties" or cross pieces for binding the boards together about the job.

Robert Swift, foreman of the carpenters, said that stacking was part of the every-day work of ordinary labourers.

His Honour submitted five points to the jury, who found for the defendant on all of them, saying that Trudell was justified in assuming that plaintiff knew how to stack timber.

At Marylebone County Court his honour, Judge Stonor, delivered judgment in the case of Stack *v.* Coulsell Brothers. The applicant was injured on September 8 by the fall of a joist while he was working, and it was admitted that he was entitled to an award in his favour if the building upon which he was engaged was within the provisions of the Act. The building where the accident happened was much lower than 30 feet in

height, and on its floor there were at the time of the accident two pairs of trestles with two boards resting upon them as a temporary scaffold to enable the workmen to work at the roof or ceiling, and in the basement below there were other pairs of trestles with boards resting on them for a similar purpose. To bring this case within the Workmen's Compensation Act (section 7) it must be shown that the building in which the accident occurred "was being constructed or repaired by means of a scaffolding." His Honour said, with reference to this point, he thought that the building now in course of erection was not being "constructed or repaired by means of a scaffolding," for he thought that the proper meaning of "a scaffolding," at all events for the present purpose, was that in which it was used by employers and workmen in their business and by everyone in common parlance, given in the "Glossary of Architecture" (fifth edition), vol. i. p. 414, namely, "a temporary erection of poles, planks (cords), &c., for the use of workmen in building walls or executing any work which they cannot otherwise reach," which is always secured and fixed, and not a temporary erection of two pairs of trestles with boards across them, unfixed, unsecured, and movable by the workman, as occasion may require. The prefix of the article appeared to him to remove all doubt from the subject, and, he must add, there was strong argument in favour of attaching the meaning given by the architect's glossary to the word in the clause under consideration, from its manifest restrictive intention and operation with regard to the building business. It began by first restricting such operation to buildings "30 feet in height," no doubt on account of the additional danger attending on buildings of that and greater height; and then proceeded further to restrict it to such buildings if they were "constructed or repaired by a scaffolding," no doubt also on account of the additional danger arising from the use of the same. Now, if this was to extend to every unfixed and movable erection of trestles, boards, ladders, &c., as contended on the part of the applicant, these words would be wholly nugatory, inasmuch as every building 30 feet high must be constructed by such means, at all events as to the roofs, ceilings, &c., and the words "constructed or repaired by a scaffolding" would have no effect, restrictive or otherwise, whatsoever. Again, the position of this further restriction and provision, coming immediately after and in conjunction with the restriction as to height, pointed, he thought, clearly to such "a scaffolding" as is used of necessity in the construction or repairing of buildings of that, or at all events of considerable, height. He therefore found for the respondents upon the second point which they had raised, and he dismissed the application.

At the Southwark County Court an important point as to the principle governing costs in Workmen's Compensation Act cases referred from the Registrar (Mr. Bros) to his Honour Judge Addison, Q.C., was mentioned by Mr. Washington, the applicant's solicitor, in a recent arbitration at that Court. Mr. Washington said the respondents were allowed up to five days within the hearing of an arbitration to answer whether they would contest the matter or not. In this case the respondents made no answer as to the facts and did not dispute them, the only point being as to the amount of the award. When before the Registrar for the taxation of costs, the respondents objected to the costs of the applicant and his witnesses (who were not called) on the ground that, having made no answer, the applicant knew that the case would not be contested and that the witnesses would not be required. Mr. Washington argued that an applicant could not reasonably be expected to wait until five days before the hearing of an arbitration before he commenced to prepare his case and subpœna witnesses. Had the applicant waited he might have been very much prejudiced in his case.

His Honour: That is the fault of the rule. When you did not get an answer at the end of five days you were entitled to take it that it was an undefended action, and you should have countermanded the subpœnas. Then you would be allowed the costs you had incurred in summoning your witnesses and countermanding them, but only in those cases where you were compelled to summon witnesses before the five days. That would be a question for the learned Registrar.

Respondents' solicitor: We have a large number of workpeople, and this question of costs is an important matter.

His Honour: Yes, and for the insurance companies, too. My ruling is that the costs of any witnesses that prove anything which is admitted before the five days preceding an arbitration—and everything, under this Act, in the applicant's particulars which is not denied is to be taken as admitted by the respondents—cannot be allowed. But where a witness must be summoned before the five days in order to secure his attendance, if, at the last moment, his attendance is not needed, all reasonable costs of summoning him and of countermanding the subpœna must be allowed. In other words, the principle of the rule is that a person must not get up his case until the issue is determined, and that need not be done until five days before the hearing, and he cannot be allowed costs incurred before that, except under exceptional circumstances.

A SCOTTISH ENGINEER IN INDIA.

THE Institute of Civil Engineers, says the Allahabad *Pioneer*, has been reproached at times, and not without justice, for too often failing to recognise the great services rendered to the Empire by members of the profession whose fields of labour lie far from the din of the Metropolis. All the more gratifying, therefore, will it be to the profession in India to learn that one of its body has been elected to the Council of the Institute. It is, we believe, the first occasion that this honour, which may be considered the "blue ribbon" of the profession, has been conferred on an engineer while still working in India, and Mr. Alexander Izat, its fortunate recipient, is to be congratulated, not only for having received such a recognition of his own distinguished services, but for having, as it were, opened the Council of the Chamber of the Institute to the rest of the profession in India. There is, we venture to think, no engineer in this country to whom the honour could have been more befittingly accorded. Mr. Izat has for many years held a position in the first rank of engineers and railway administrators, and to his fertile brain, his enterprise, and tenacity the opening-up of these provinces by metre-gauge lines is very largely due. This gauge, under his guidance, has proved itself one of the most powerful and useful agencies in the development of the country, penetrating large and important tracts which were financially inaccessible to the standard gauge. It has had also a very material influence on the standard gauge itself, forcing it to keep pace, in a measure, with its less heavily burdened and often more enterprising competitor. Mr. Izat's Indian career dates from 1863, when he came out from home and joined the Government service as a Stanley engineer. His services from then till 1870 lay in the Berar Hyderabad Assigned Districts, and it was during the latter part of this period that he was selected by Government to construct the first State railway in India—viz. the Jalanib-Khamgaom Railway. This line, about eight miles in length, which opened up the rich cotton tracts of Khamgaom, was started in 1869, and completed the following year, when it was opened by the late Lord Mayo, then Viceroy. Since then Mr. Izat has been continuously connected with the railway progress of the country. From 1870 to 1874 he was employed as an executive engineer on the Nizam's State Railway, holding charge of the Cogna Division, which included the building of the Cogna river bridge and other important bridges. The Cogna ge was opened in 1874 by Sir Salar Jung, Mr. Saunder being Resident. After this Mr. Izat was posted to the Holkar State Railway, and was given the construction of the Holkar-Nerbudda Bridge, consisting of fourteen spans of 200 feet. Some idea of the magnitude of this fine work, which was opened by the then Maharaja Holkar in 1877, may be gained from the fact that the height of the structure from water-level in the river to rail-level was 102½ feet. Mr. Izat was then transferred to the Dhond and Manmad Railway, of which he became engineer-in-chief. While carrying through this line he was also appointed engineer-in-chief of the Bhavnagar-Gondal Railway and the Bombay Eastern Deccan Railway. The Dhond and Manmad line was opened by Sir Richard Temple in 1878, and the Bhavnagar-Gondal by Sir James Ferguson in 1880. Having successfully completed these lines, and laid out and constructed the part of the Southern Mahratta Railway between Hubli and Gadag, Mr. Izat took a two years' well-earned furlough. While at home the Bengal and North-Western Railway was floated, and the newly-formed company were fortunate in being able to secure his services as their agent and chief engineer in India, a post he took up at the beginning of 1883. About the same time he became consulting engineer to the Rohilkhund and Kumaon Railway, and in 1888 agent and chief engineer of that line. Later, he was made consulting engineer to the Bengal-Duars Railway, and for some time filled the same office for the Bengal Central Railway.

Under his management the works on the Bengal North-Western Railway made rapid progress. The first section, between Nawabganj and Bahraich, was opened in 1884, and in 1885, the following year, the main line from Sonepur to Mankepur. The opening ceremony on this occasion was performed by Sir Rivers Thomson, Lieutenant-Governor of Bengal, and Sir Alfred Lyall, Lieutenant-Governor of the North-West Provinces. Further extensions were soon added—viz. the Uska and Naipalganj branches in 1886 and the Kurlganj branch in 1891. After the completion of the Gunduck Bridge at Sonepur, the management of the Tirhoot State Railway was handed over to the Bengal and North-Western Railway, an amalgamation which, while benefiting the company, has also proved of not less benefit to the State, both directly and indirectly, as well as to the country at large. In the meantime the Rohilkhund and Kumaon had linked up the Lucknow-Gola and Bareilly-Philbhit sections of the Lucknow-Bareilly Railway; the through metre-gauge route being opened by Lord Lansdowne, then Viceroy, in 1891. The event was followed by the opening of the Dudwa branch of that line

LIST No. 4.

ART PLATES FROM "THE ARCHITECT."

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing.

TH BANQUET. By the late H. STACY MARKS, R.A. A beautiful Art Plate, Printed in Colours, size Thirty-nine Inches in length by Fifteen Inches in depth. Price One Shilling and Sixpence, postage free.

CAIN AND HIS FAMILY. By Mons. F. CORMON. Size, Twenty-eight and a Half Inches by Eighteen and Three-quarter Inches Price, One Shilling and Sixpence; by post, One Shilling and Ninepence.

THE EMBARKMENT FOR THE ISLE OF CYTHERA. By ANTOINE WATTEAU. From the Painting in the Louvre. Size, Thirty and a Half Inches by Twenty and a Half Inches. Price, Two Shillings each; by post, Two Shillings and Threepence.

THE RETURN FROM THE CHASE. From the Painting by Mons. F CORMON. Size, Thirty Inches by Twenty Inches. Price. One Shilling and Sixpence; by post, carefully packed in roller, One Shilling and Ninepence.

ST. PAUL PREACHING AT EPHESUS. By EUSTACHE LE SUEUR. From the Painting in the Louvre. Printed in red or black. Size, Thirty Inches in depth by Twenty Inches in width. Price, Two and Sixpence each; by post, Two and Ninepence.

Publisher, P. A. GILBERT WOOD, Imperial Buildings, Ludgate Circus, London, E.C.

in 1893. The construction of the Nanpara-Katarnian Ghat, the Gonda-Bulrampur, and Bhatni Tustipur extensions were sanctioned in 1894, and Mr. Izat's next achievement was to carry through the linking-up of the Bengal and North-Western Railway, the Rohilkhund-Kumaon Railway and the Rajputana-Malwa Railway. Now that this is a *fait accompli*, it is hard to realise what difficulties had to be overcome before this the natural and legitimate destiny of the metre-gauge could be fulfilled. The Ganges-Gogra Dooab extensions of the Bengal and North-Western Railway, and the Hajipur Katihar of the Tirhoot State Railway, as well as the construction of the Elgin Bridge—the approaching opening of which we lately chronicled—became part of the general scheme which included the linking-up project. When these lines are completed the Bengal and North-Western Railway system will be about 1,250 miles in length. It is still young and vigorous, and further extensions, aggregating over 300 miles, have already been surveyed, and are likely to be soon under construction. It will thus be seen that what might otherwise have been a series of fragmentary lines is now being rapidly converted into a great through metre-gauge system with important offshoots extending from the West Coast in Gujrat across Rajputana and the whole of Northern India to Assam. It cannot be a matter of many years before the next stage linking up this system with the Burma Railway will be reached, and one need not be over-sanguine to predict that early in the coming century even the frontier of Burma will be crossed and an overland route to China formed as a continuation of this Indo-Burman metre-gauge system. In the meantime Mr. Izat may well contemplate with pride the extent of the existing system, in the creation of which he has taken such a prominent part. At any rate, this brief sketch of its history and expansion in the hands of the distinguished engineer who is the subject of this article will show that Mr. Izat's position in the Council of the Institute not only reflects honour on himself, but on the Institute and the profession it represents.

An Edinburgh gentleman who has known Mr. Izat for forty years writes:—Mr. Izat was one of those who received the New Year's honour of C.I.E. Mr. Izat, like the late Mr. M'Currich, engineer of the Bristol Docks Commissioners, was educated at Dollar Academy. The master who trained Izat for the Public Works Department of India was the late James Lindsay, LL D, one of the best mathematical scholars of his time. The first Scottish engineers who passed through Cooper's Hill were all from Dollar Academy, the privilege of sending them having been secured to the Academy by the late Mr. W. P. Adam, M.P., one of the Governors. In 1863 the Government had ten appointments to the P.W. Department in India, and the Dollar "boys" carried off four of these, Izat being one of the number, and (I remember) coming out fourth—a wonderful achievement, considering that the Scotsmen had to compete against Englishmen and Irishmen some of whom had been "up" for examination before.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

1048. Thomas Neil Muller and John Edward Stead, for "Improvement in the manufacture of solid bricks from magnetic iron sand or fine particles of magnetic iron ore."

1059. Henry Clarke Pruce, for "Improvements in means for opening, closing and fixing fanlights, windows, shutters, ventilators, doors and other analogous articles."

1254. Joshua George Mills, for "Improvements in wind-guards for chimney-tops."

1281. Charles Temperley, for "Improvements in the manufacture of wooden blocks for paving and flooring, and in the method of laying same."

1302. Ludwig Grabau, for "Improvements in cements."

1322. William Sandover, for "Improved appliance for opening and closing fanlights."

1345. Clarence George Evans, for "An improved window-fastener."

1387. David Septimus Bryden, for "Window-blind check."

THE WEEK.

It was intended to place the memorial of the late Sir John Millais in St. Paul's Cathedral if a suitable place could be found. A sub-committee of the memorial committee was formed to visit St. Paul's and consult with the Dean on the subject. The sub-committee having reported that the Dean and Chapter were strongly opposed to the erection of any memorial on the floor of the Cathedral, and this decision having been confirmed by a subsequent letter from the Dean, the memorial committee after consideration came to the conclusion that the objections were insuperable, and that the idea of a memorial statue in St. Paul's must be abandoned. At a meeting of the committee which was held at Marlborough House on Wednesday, under the presidency of the Prince of Wales, it was proposed by the Earl of Wemyss and seconded by the President of the Royal Academy, that "a statue be erected in a prominent position in connection with the National Gallery of British Art founded by Sir Henry Tate on the embankment at Millbank." This resolution was carried. It was further resolved to invite contributions for carrying the object into effect. It is calculated that the amount required is from 1,500*l.* to 2,000*l.*, and towards that amount a sum of 727*l.* was contributed at the meeting. Subscriptions may be sent to the Bank of England, western branch, Burlington Gardens, W., to the account of the Millais Memorial Fund; or to the honorary treasurer, Mr. James Knowles, Queen Anne's Lodge, Westminster; or to the honorary secretaries, Sir Edward J. Poynter, P.R.A., 28 Albert Gate, S.W.; and Mr. Peter Reid, 30 Norfolk Street, Park Lane, W.

Mr. Ruskin attained his eightieth birthday on Wednesday, and he received abundant evidence of the esteem in which he is held, not only by members of the St. George's Guild and other Ruskin societies, but by all who love art, ethics and literature. The address from Oxford expressed sentiments which will find general acceptance. It was as follows:—"We venture to send you, as you begin your eighty-first year, these words of greeting and goodwill, to make you sure that in Oxford the gratitude and reverence with which men think of you is ever fresh. You have helped many to find in life more happiness than they thought it held, and we trust that there is happiness in the latter years of your long life. You have taught many to see the wealth of beauty in nature and in art, prizing the remembrance of it, and we trust that the sights you have best loved come back to your memory with unfading beauty. You have encouraged many to keep a good heart through dark days, and we trust that the courage of a constant hope is yours." From occasional expressions in his books, we know that Mr. Ruskin was often depressed at the thought of the small extent of the influence he was able to exert after devoting his life and fortune to the common good, and without any thought of self-seeking. But of late years there are many signs that his worth is becoming more recognised, and Mr. Ruskin need no longer fear that the interest of his books depends solely on the style, but rather on the thoughts which are recorded in them, and which many have found to be inspiring.

An interesting case, which was one of the consequences of the recent gales, was heard last week before the bench of magistrates at Brentford. The clerk of the Twickenham District Council applied, under the Highway Act, for an order to remove a tree which had fallen across the path in the Strawberry Hill Road, and thus obstructed the traffic of a public highway. If considered simply as an obstruction the council could deal with it, but a tree is like a living thing and does not come under the jurisdiction of an authority such as a district council. As the roots were only partly torn out the tree was supposed to be still growing in the soil, and any interference with it would be an invasion of private property, especially as the fence would have to be crossed. The Act says that timber can be removed by an order from the justices, but it is doubtful whether a tree which, however slightly, has a hold on the earth by its roots, can be regarded as timber. A notice was served on the owner, but he paid no respect to it. There was a long discussion between the magistrates and the clerk, but the bench could not be persuaded to grant an order, and held that one was not needed. The council were advised to remove the tree, but an informal opinion will be of no avail if the owner should take an action for interference with his property.

The Bank of England note is prized throughout the world, although it is not remarkable as a work of art. The Governors endeavoured to make it one, for they employed Daniel Maclise, R.A., to draw the Old Lady of Threadneedle Street as a youthful maiden. John Thompson was the engraver. But in spite of their united talents it cannot be said the figure is a success. The authorities of the Bank of France are more fastidious. They obtained a design from M. Glaize, and it remains unused. Another by M. Olivier Merson has had a like fate. M. François Flameng was also commissioned, and, although a plate has been engraved from his painting, it is not certain when notes will be printed from it. The English bank-note is so familiar there might be some difficulty in superseding it, but there is no doubt it does not exemplify modern English art, and a more suitable design could be easily obtained.

Many sanguine if ignorant people anticipated that before now the ground required for the Strand improvement would be in the possession of the London County Council. But out of ninety-eight properties which exist in the short distance between the church of St. Mary and the church of St. Clement Danes, only three have been purchased. The remainder are in the preliminary stages which have to be gone through before a settlement is reached. The adoption of the piecemeal principle has produced its inevitable result. If the Strand properties are acquired by the County Council the values of the north side of Holywell Street will be enormously increased, and the houses along the route to Holborn will be priceless, a result which was anticipated long ago, when the Metropolitan Board of Works began to moot a scheme, and when wise speculators turned the notion to their own advantage. Accordingly, Mr. Shaw-Lefevre and the improvements committee recommend that policy of masterly inactivity which is a resource with all public men who have blundered. In their report they say:—"If the block of buildings between the Strand and Holywell Street be removed before the Council proceeds with the purchase of the property on the north side of Holywell Street, we are advised that that property will become very considerably enhanced in value, and the cost of the new street from Holborn to the Strand will accordingly be much increased. This being so, we are strongly of opinion that it is best not to arrange for the demolition of the block of buildings until the Council's Improvements Bill receives the sanction of Parliament, which will probably be about next July. In the meantime we are pressing forward the negotiations for the acquisition of all the interests in the property in question." But the acquisition of the property will have exactly the same effect as its demolition. Would a railway company act like the County Council? Companies in general depend on experts, the Council deal with property as with works after the manner of amateurs. The negotiations about the Strand property should be enough to assure all who have way leaves for water-pipes to dispose of along the route to Wales that they are about to rejoice in showers of gold which the inhabitants of the Metropolis will provide for them.

It is with sincere regret we record the death of Mr. George A. Spottiswoode, the head of the firm of Spottiswoode & Co., who have printed *The Architect* from its first number. He died on Wednesday night of pneumonia, after a very short illness. Mr. Spottiswoode devoted a large portion of his busy life to public affairs, especially those relating to the Church of England. He was one of the most prominent laymen. His interest in architecture was not transient nor superficial. Mr. Spottiswoode was an Honorary Associate of the Institute.

SCOTTISH WOODWORK.*

ONE of the deficiencies of Scotland which enabled Dr. Johnson to tease Boswell was the scarcity of timber. When he heard of only two large trees existing in one of the counties, says Boswell, "he laughed enormously, calling me to hear it." In his "Journey to the Hebrides" Johnson related how the hedges in Scotland were of stone, for instead of the verdant thorn to refresh the eye, which was common in England, there was a bare wall or dyke. A slight acquaintance with Scottish interiors, however, will afford enough proofs that, wherever it came from, there was enough timber available not only for construction, but for decorative purposes. Having a superabundance of stone that would endure, the builders were wise to employ it as often as possible, and in consequence stone staircases are more often found in proportion to the number of buildings than in England. But in the churches we find galleries, pulpits, pews, which are in places elaborately carved, and in dwellings we see not only panelling of the walls in timber, but of the ceilings also. The heraldic carving of some of the galleries, where the lairds and their families appeared on Sabbath days, is as remarkable as any work of the class to be found in Spain. The builders realised that for the coldness of stone compensation could be given by an abundant use of timber, and if we were to judge by the quantity of woodwork, there would appear to be little doubt that Scotland was rich in forests.

That it was so during ages appears to be unquestionable. According to Sir Walter Scott, the neglect of proprietors allowed natural decay to destroy trees in immense numbers. In his day the conversion of forests into bogs was still going on. The numerous invaders of Scotland destroyed forests because they were supposed to aid in the defence of the country. In the time of Charles I. a tract of about 270 square miles forming Ettrick forest was entirely wooded and reserved as a royal chase. As late as 1700 a great part of the forest remained. In other parts of the country indifference led to waste. According to Scott, "the neglect of enclosure on the side of the landlord, the permitted if not authorised invasions of the farmer, the wilful introduction of sheep and cattle into the ground where old trees formerly stood, have been the slow, but effectual causes of the denuded state of extensive districts, which in their time were tracts of what the popular poetry of the country called by the affectionate epithet of 'the good green wood.'" In considering any subject connected with woodwork in Scotland, it is well to keep the preceding facts before us. Although his sight was dim, Johnson was a shrewd observer of men, their manners, and customs. But he was none the less a Cockney, who judged things by the Fleet Street standard. He saw few trees in Scotland, and concluded that the country was always as bare as Bolt Court. Scott could take a wider view, and was able to understand the causes which changed forests into deserts.

When we gaze on the plates which Mr. Small has drawn, it is therefore reasonable to conclude that the materials of which the numerous examples of furniture were constructed were generally of native growth. The construction and ornamenting could of course be as well exercised with pieces of foreign timber, but it is always more satisfactory to have things which were the product of the soil, especially in Scotland. It is possible, however, that an occasional log of foreign timber was used, just as we can suppose that some of the ornament was carved by a foreign hand, a Dutchman or a Frenchman; but as a whole Scotland can claim what is found represented in the volume. The period to which the woodwork belongs is the sixteenth and seventeenth centuries. It suggests the influences which were in operation in Scotland, when we find there is no trace of Gothic. Every example reveals indebtedness to Italy, but in an indirect manner, for the furniture recalls examples in England, France, Holland, or Germany.

Mr. Small tells us that for a number of years he was occupied in making drawings of all the woodwork to which he could obtain access. His drawings were prepared on an inch scale, with full-sized details, in face of the objects. He says, "Delightful labour it has been to me, being in thorough sympathy and love with the subject." The drawings show a most praiseworthy endeavour to be accurate, and we have no doubt the collection will be found to have much interest for designers and collectors, as well as for that large body of natives scattered abroad, to whom the least thing that is Scottish appeals with irresistible force. The majority of the examples present specimens of old furniture, but there are some which are entitled to be considered as representing "fixtures."

For instance, there are half-a-dozen specimens of "shutter-boards." We are told that "they formed the lower part of the windows, generally occupying more than half the space, and were made in two leaves to open inwards, the top part of the windows being filled with fixed glazing, so that the shutter-boards were the only means for regulating the entrance for fresh air." A panel treatment with several mouldings was common, and these semi-casements show a good deal of neatness in the adaptation of ornament and in the metalwork. It is not often a bed can be considered as a fixture, but one from Culross was constructed beneath a window, and at night it rested on the floor. During the daytime, when folded up, the recess was concealed, and the bed appeared to be a series of panels. It is allied to Goldsmith's "A bed by night, a chest of drawers by day." Both beds were equally unhealthy. Some shelves which at one time were attached to the wall merit attention from furniture-makers, for with the pilasters at the ends they have an architectural appearance, which might easily be attained in ordinary bookshelves without any great expenditure.

The largest examples are the pulpits. One belonging to the Society of Antiquaries of Scotland indicates respect for some very remote Gothic precedent. It expresses perpendicularity which was in keeping with neighbouring columns or piers, and the panels are filled with a running ornament. In plan it forms two-thirds of an octagon, one of the sides serving as a door. Another pulpit from Stirling Church is less liney, those which are introduced being mainly in the form of flutings of Corinthian pilasters. A cabinet which is supposed to have belonged to Archbishop Sharpe is rather elegant. It is made of oak of a warm brown tint, with inlaid work of boxwood and ebony; in the door-panels and frieze of cornice the buttons and drops are of a close-grained wood stained brown. A cabinet from Linlithgow Palace is also interesting, with the exception of a clumsy rail which divides the upper from the lower part. It is raised nearly a foot above the ground, and stands on massive supports. A cabinet from Stirling Palace, which is associated with Anne of Denmark, has a foreign aspect. This in a great measure arises from the inlaid architectural panels to the lower cupboard doors. Mr. Small says: "it is of oak of a light colour plentifully inlaid in the cornices, door-framing, and panels with various-coloured woods, the groundwork of inlay being generally of box, with the foliage and ornaments of ebony and various shades of browns and yellows, many of the inlaid parts being burned at the edges and other parts to give variety and shade. The whole forms a very harmonious picture, with none of the hard, coarse contrast of colours seen in the modern wood inlayer's productions." It is a pity the history of the cabinet cannot be traced, for this single work by itself, if produced in Scotland, would testify to an advanced state of industrial art. A press or wardrobe, also from Stirling, is less ambitious. The arrangement of the ornament is subservient to the general effect, and Mr. Small is able to say with confidence that there is an undoubtedly Scots character about it. The greater part is cut out of the solid.

A table from Trinity College Church, Edinburgh, was presented by Mary of Gueldres. There are Corinthian columns at the corners, with the further support of an arcade. The table from Holyrood, known as Queen Mary's work-table, in principle corresponds with modern Sutherland tables. A table from Dunfermline Palace has legs that appear to be copied from vases or cups in metal. They are too gross for their use, but similar legs must have been common, and the late B. J. Talbert utilised them in some of his designs. They look as if cut out of the solid, but according to Mr. Small, they were only clamped and glued up to the size required.

* *Scottish Woodwork of the Sixteenth and Seventeenth Centuries.* Measured and drawn for the stone by John William Small, architect. Stirling: Eneas Mackay. London: B. Quaritch.

The chairs have a stiffness in the backs which is enough to make victims to lumbago nervous. There could hardly be a more efficient aid to dignity. Mr. SMALL gives a variety of examples, but, however they may differ in form and treatment, they correspond in being uncomfortable. The late ANDREW HEITON, of Perth, was not only a clever architect, but, unlike the majority of his brethren, he was an enthusiastic collector. His old Peel tower at Darnack contained a most interesting collection, from which a very curious couch, and a bed which is like a temple of sleep, have been derived. Among other examples are a chest from Paisley, "Queen Mary's Cradle," which was saved from the fire at Linlithgow Palace in 1746, a bed from Dunfermline Palace, and several examples of doors and panelling.

It must not be supposed that the Scottish work surpasses contemporary English work, and much less is it comparable with the French carving of the time. The wonder is that in so remote a region so much excellence was attained. In the ornament there are few patterns, but each of them is adapted to its position. As a rule, strong common sense inspires the designs. The plates are therefore useful to show how efforts were made to combine utility with decoration, and if read aright the modern designer will find they can teach him something. Mr. SMALL's zeal was not misplaced when it produced so interesting a collection.

SYSTEMS OF DISTRIBUTING AND GENERATING ELECTRICITY.

By F. J. WARDEN-STEVENS.

(*Continued from page* 77.)

IT will now be advisable to discuss steam power, which is, of course, usually adopted in this country.

As with water power, the important consideration is that the plant and arrangements are such that the interest on capital, added to the cost of maintenance, is a minimum, and this must be clearly kept in view.

Boilers.—There are several classes of boilers in use, differing greatly in the relative arrangements of fire and water. The leading types are :—Lancashire, water-tube, dry-back marine, marine and locomotive. All these boilers are divisible into two classes, the fire-tube and the water-tube. In the fire tube class the water is outside the tube or tubes carrying the gases, while in the water-tube boiler the water is inside the tubes and the gases outside.

Owing to the fact that with the fire-tube class there must be a large outer shell, its strength is not so great, but it is cleaned more easily as a rule than the water-tube boiler, as the latter usually consists of tubes of small diameter. The quality of the water available for feed purposes is of great importance, and should be submitted for analysis, in order that the proportions and nature of the carbonates, &c., may be ascertained, as this determines to some extent whether the boiler should be of a water-tube or fire-tube class, as there is a considerable difficulty in keeping the water-tubes free if the deposit is at all heavy.

A description of the usual types of boilers in use and their advantages may here be of interest.

A Lancashire boiler consists essentially of a long drum constructed to withstand the required pressure, being usually about 7 feet to 8 feet in diameter, and 25 to 35 feet long. Two large tubes or flues are fixed lengthwise in these drums, leaving two clear ways for the firing and for the flue gases the whole length of the boiler. After passing through these internal flues the gases usually pass around the outside of the boiler to the front, and back to the chimney underneath the boiler. By this means a considerable amount of the heat is transferred from the gases to the water before they reach the chimney.

The Lancashire boiler must be kept at an even temperature, it cannot be heated up or cooled rapidly. Owing to the large and comparatively flat nature of the surface, with this boiler it is easy to remove any deposit which may form on the plates due to unsuitable water. Its great length, the nature of the seating, and the construction of the boiler, are such that any unequal expansion will either buckle the ends or cause other serious damage. The result of this is that it must be kept banked when not required for use. The coal and attention necessary while doing no useful work thus become a matter of great importance. In electricity supply works, when the time of use of the boilers is a small percentage of the whole, it is preferable to have a type of boiler in which the coal and labour required to heat up is small, in which case banking is not necessary.

The Lancashire boiler often has cross water-tubes fitted in the flues which greatly increase the quantity of water that can be evaporated. The advantages of Lancashire boilers are steady steam pressure, they can be used with water unsuitable for other boilers, and with the little attention required they are excellent for steady work. The disadvantages of the type are that it cannot be steamed up rapidly, it is not in itself economical, it occupies a large amount of space compared with its power, and is not suitable for unsteady demand unless other conditions such as unsuitable water make its use advisable.

One type of water-tube boiler consists of a steam drum, running the whole length of the boiler from front to rear ; at each end there are fixed what are known as headers, *i.e.* almost vertical tubes which receive the water-tubes. The water circulates in the following manner: the cool water sinks in the rear header, where the temperature is comparatively low, and enters the water-tubes, which are raised at the front end. The water is heated in these tubes, which are exposed to the full action of the hot gases, and the mixture of steam and water entering the front header rises into the steam drum. The rows of tubes are subdivided laterally by firebrick partitions to compel the hot gases to pass through the spaces in a tortuous manner, thus extracting the greater part of the heat. The result of this arrangement is that the temperature of the gases that leave the boiler is much reduced. It may be taken generally that those boilers that are heated easily will need a great amount of attention if the steam pressure and water level are to be kept constant. The difficulties with the water-tube type of boiler have been due chiefly to the question of circulation and unsuitable water. The latter difficulty necessitates frequent cleaning, and the tubes are not favourably arranged for this. If the deposit is very thick there is danger of overheating and subsequent bursting of the tubes.

Dry-back marine boilers are in their construction somewhat similar to the Lancashire type, but the flues consist of a large number of longitudinal tubes of small diameter. In this respect they resemble the locomotive boiler, but are much longer.

Marine boilers are practically similar to the type of boiler used at sea. They are short and of large diameter, and as a result they take up little floor space. The inside of the boiler is subdivided vertically, so that the gases find their way out in a tortuous manner. They are probably easier to clean than any type excepting the Lancashire, and as a consequence they are being used frequently in electricity works. They require no brickwork, and are fairly economical, but it must be remembered, however, that this type was not designed for electricity supply work, and it is doubtful if they really fulfil the conditions as well as the dry-back marine boiler.

Locomotive boilers are used considerably for general purposes, but they are difficult to clean, not very economical, and they are unsuitable for the long runs which occur in electricity supply works. The fire-box is badly situated for removing clinker, and the result of doing so is a severe fall of steam-pressure.

Having now briefly described the various types of boilers and their properties, it may be of interest to give a few figures (recently brought forward) concerning the space occupied and the cost of evaporating water by the various types :—

Type.	Pounds of Water evaporated per lb. of Coal.	Temperature of Gases leaving Boiler, in degrees F.	Price in Pounds per 100 lbs. Water evaporated economically per hour.	Rate of Depreciation per annum.
Lancashire, with economiser	12·0	250	23·3	5%
Water-tube	11·5	350	14·2	7%
Dry-back marine	11·0	600	14·5	6%
Marine	11·0	600	15·0	6%
Locomotive	11·0	600	15·0	7%
Lancashire, no economiser	10·0	600	19·7	3%

The price in pounds is taking the cost of boiler, fixing, &c., and the cost of ground and buildings at 2*l.* per square foot occupied.

As is usually found, the most economical is roughly the most expensive.

A very good combination of boilers is to have a Lancashire and economiser for continuous running day and night, and to use water-tube for connecting at times of heavy demand. This fulfils the ideal conditions of each boiler, and has been adopted with success.

Of course, it is impossible to state that the best kind of boiler is of any particular type, circumstances must be considered. The most important considerations are :—Average hours of use per day, the rate at which the demand increases as a maximum, the kind of fuel to be obtained, the nature of the water obtainable, the value of land and cost of building, and the cost of coal. All these considerations affect the question of (1) the extent to which it is advisable to sink capital to save coal, and (2) which class of boiler is best suited to the running conditions

Economisers.—An economiser consists of rows of tubes placed vertically in the main flue which obstructs the flow of the hot gases, and a great part of their heat is transferred to the feed water which passes through these tubes on its way to the boiler. As will be seen from the boiler table, the temperature of the flue-gases is reduced from 600 to 250 deg. with a Lancashire boiler by using an economiser. The pounds of water evaporated increases from 10 to 12 per lb. of coal with an economiser, *i.e.* an increase of 20 per cent. in the efficiency. The efficiency of the water-tube boiler mentioned is increased only slightly by using an economiser, the temperature of the flue-gases being considerably lower.

It is advisable that the feed-water should not be quite cold when entering the economiser, as otherwise there is a deterioration owing to the sudden rise of temperature of the water on entering. This sudden rise will also cause the whole of the deposit to be precipitated in one place and may choke the tubes. It is therefore better that this should take place in another heater capable of being easily cleaned if hard water is used ; but, of course, in cases where condensed water is available this is unnecessary, as the water from the hot well will not produce a deposit. It is necessary that the outside of the tubes be kept clean, and there is usually a small engine or electric motor for this purpose, rings being pulled up and down the tubes.

There is no doubt that the name "economiser" expresses very truly the effect of their use in most cases, although it must be remembered that the chimney draught is affected and they take up space, which is a consideration.

Chimneys.—There is no necessity to here describe fully the construction of chimneys, but there are several points which should be touched upon.

The chimney fulfils two main purposes—the conveyance of objectionable gases into the atmosphere at such a height that they will not be a nuisance in the immediate neighbourhood, and will have an opportunity of being well diffused before they can come in contact with the lower portions of the atmosphere, and, in the second place, to provide a draught of sufficient strength to draw the required quantity of air through the fuel. From both points of view it is advisable to have a high chimney.

The chimney as a draught-producer acts on the principle that there is inside the chimney a column of gases which is at a considerably higher temperature than those outside. The difference of weight between that of the column of hot gases and that of a similar column of cool air is the propelling force. It is evident that the resistances this force has to overcome are chiefly the friction in the flues, fire-grate, and chimney. The friction in the chimney is proportional to the height, so there is little use in greatly increasing the height above certain limits. A given quantity of gases can be disposed of with equal ease if the chimney is of large section, and not high, or of small section and high; and as there is often a probability of extensions being required later with electricity supply works a large but short chimney is built at first, so arranged that its height can be increased as desired at a later date, when the quantity of gases to be dealt with increases. A condition which limits the height of a chimney is that of radiation, and it is evident that the gases whilst in the chimney must not be allowed to cool any more than can be avoided. For these reasons iron chimneys are much less economical than brick ones, and the limiting height is therefore much less, as the cooling is greater.

As it can be seen that the draught produced is not increased in proportion as the height increases, on account of the extra surface friction and radiation, it is evident that very high chimneys are not advisable, as the cost of building increases rapidly with the height. This is due to the conditions of stability. As the height increases, so must the area at the base, and the thickness of brickwork. It therefore follows that chimneys for large powers can economically be built higher than those for small powers.

There is a height for every chimney where, having already fulfilled the first condition—that of absence of nuisance—it is not advisable to build higher for draught, but where it should be produced by means of mechanical apparatus, such as fans or steam jets suitably arranged. It must be remembered that the efficiency of a boiler is roughly inversely proportional to the temperature of the chimney-gases. Referring to the table, this is distinctly seen. For instance, taking the Lancashire boiler without an economiser, it can be seen that its chimney-gases are at 600 deg. Fahr., while it evaporates only 10 lbs. of water per lb. of coal. This is the worst result mentioned; but if an economiser is added, the best result is obtained, *i.e.* 12 lbs. of water evaporated per lb. of coal, while the flue-gases are the coolest, viz. 250 deg. Fahr. It is often pointed out that the extra economy by using an economiser on all but the water-tube boiler, viz. 20 per cent. in the case of a Lancashire boiler, is far more than the cost of producing the draught by mechanical means. For these reasons it is often found advisable to use a short chimney with natural draught during light load, and to use forced or induced draught at times of heavy load. It may be generally taken that steam-jet draught-producers are not as economical as suitably placed fans, although they are frequently used on account of their convenience, low first cost, and cost of maintenance, and where not in use continuously economy is not of so great importance.

Iron chimneys are little used in this country for electricity works. They are chiefly used in America, where conditions are very different.

It may be well to point out that little or no benefit is obtained by a chimney of too small diameter ; one large chimney costs less than two of half the size but of the same height. It is better, if economy in capital is necessary, to build a large short chimney, with a view to increasing its height later when more flue-gases have to be dealt with. The same applies to main flues ; they should be of ample size, in view of the inevitable extensions with electricity supply works.

Mechanical Stokers.—These are used where the fuel is of a poor description and of such a nature that the stoking must be frequent and a small quantity used at a time. There are two kinds of stokers in general use, the "sprinkling" and the "coking."

Mechanical *v.* hand stoking is intimately connected with the question of smoke nuisance. It will be well to consider why smoke occurs when coal is used which is of a gassy nature, and contains sulphur. It is evident that with an ordinary fire a large proportion of the gases will and do escape unburnt. The products of combustion are not simply water and carbonic acid gas, both of which are colourless, but sulphurous gases and heavy hydrocarbons. The sulphurous fumes can be converted into sulphurous acid if heated in the presence of oxygen, and the heavy hydrocarbon gases will burn if they are heated. This is usually accomplished by providing a combustion chamber, *i.e.* a space in the boiler lined with fire-brick, which obtains the greatest heat; but this is not possible with water-tube boilers. Now when in any boiler large quantities of coal are thrown on a fire the coal distills rather than burns, and gases which contain much carbon are given off; these gases, on coming into contact with a cold surface, such as a boiler-plate or a flue, deposit soot, and also become black smoke. The only way to prevent smoke nuisance is to coal in very small quantities at frequent intervals, or to feed coal in front and gradually feed it back. The unburnt gases will then be completely burnt in passing

over the hotter coals behind. With water-tube boilers, however, the gases rise almost vertically as a rule, and therefore the second method is useless for them. To prevent smoke it is thus necessary to put on coal in small quantities continuously. This cannot be done with hand-firing; the door would be open all the time, and there would be a rush of cold air, which would do more harm than the improved stoking did good. This must be done by means of a mechanical stoker. It is found that the sprinkling stoker works well with water-tube boilers, and allows poor coal to be used without excessive smoke.

The coking stoker is useful for Lancashire and other types of boiler. The coal is fed and is pushed back continuously to the back of the furnace, where the ashes and clinker fall into the ash-pit.

(To be continued.)

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at 9 Conduit Street, W., Mr. J. H. Fellowes Prynne, president, in the chair.

The following were elected members of the Association :—Messrs. F. J. Palmer, J. H. Taylor, and A. S. Vernon.

Mr. Christopher Whall gave a lecture and demonstration on

Stained-Glass.

Mr. Whall began by offering an excuse for coming among them without prepared notes, but so closely was his time occupied that he had not had leisure enough to dip into the history of glass. He proposed, therefore, a regular work-bench talk, from which he hoped they would derive some useful information. It seemed odd, perhaps, that they as architects should be desirous to learn something of the work of craftsmen, and this curiosity on their part suggested two questions. What did they want to know about stained-glass? and why did they want to know anything of the work? They were curious questions, but if the reason of asking was sufficiently clear the answer might lead to a proper understanding as to how architecture was allied to the crafts. A knowledge of stained-glass work could be of great use sometimes to an architect, but the acquiring of such need not necessitate the sacrifice of an architectural career. To commence, the actual production of stained-glass windows was very simple. There was first the letter from a client wishing for a sketch of the subject he desired. The artist would be guided in his drawing by the purpose of the window and the sum that was to be laid out in its production. These preliminaries settled, the artist (having already in his mind a conception in the small of the whole work) had to make a cartoon full size. The essential point was that the cartoon should be made by a craftsman, because a thorough knowledge of the stages in stained-glass work was necessary. He must know perfectly well what could be done in glass, and what could not. A draughtsman might make a design beautiful in itself, but impossible to carry out in glass because he was not aware of its limitations. The rule the lecturer adopted in the production of glass work was to make as effective a drawing as he could, and to mar it as little as possible by working lines. Before commencing the drawing an idea of the whole was conceived. The design completed, a tracing was made showing the lead lines only. This governed the entire of the work of the window, and the glass to be used was cut by it. The cutting took a long time, and architects were recommended to try and do some of this part of the work for themselves. A different and kinder view of stained-glass work was often the result of their efforts. The next step was the painting of the glass, the pieces of most importance and anything of elaborate form being laid down on the cartoon and traced. After these pieces were all traced they were waxed up on a sheet of glass, and the actual painting with a shade pigment laid on in "matt" was commenced. By this method an even surface was obtained, which answered very much the same as the ground in a mezzo-tint. There were three main ways of shading. The first was the stipple, by which the glass could be worked up in a wet state to a very high degree of finish. An even and perfect ground was thus laid, but it took time to dry. So perfect, indeed, was the gradation of shade, that skilful workers could produce great finish even at this stage. When dry, there could be taken out of the "matt" most beautiful and finished lights, and the artist could produce as much realism and finish as he liked. Before this painting stage was reached the lecturer said he should have called attention to a practice which was peculiarly his own. This was the making of a sketch of the material itself. It was not the kind of work a designer would show to his client, but it would guide the artist in his creation. It was a great deal of trouble to make a sketch to scale, and by this method it was unnecessary. The lecturer said he still planned out all the combinations in colour and had the pieces waxed up. After these preliminaries they would suppose the work of a window in its first stage finished. Then the work had to be fired. The pieces were taken and placed in the kiln, where the pigment was burnt in, and so entered the glass. The enormous question of permanency of the work depended upon this firing. The uses of different pigments had something to do with it, but permanency would in some cases be due solely to the firing. An allowance would have to be made in the colouring for what the kiln would undo, and the spoilt parts could be touched up again afterwards. The firing and retouching were in some cases repeated two and three times. Work had often to be toned by means of yellow stain, an invention of the fifteenth century. The virtue of stained-glass did not consist in what was put on, but in the colour that resulted. The yellow stain was, of course, an exception, and was one of the most valuable aids to effect possessed by the artist in stained-glass. Careful moderation in the use of this stain was necessary. Red, too, was good for shading; the greyer pigments were less satisfactory. Different coloured glasses were used to subdue hard colours; green was useful in toning the highest white. This introduction of green did away with the purley glass, the mark of the fifteenth-century work. After the window was all painted and fired, it had to be leaded up. The whole work was carefully laid down on the bench, and the lead was put round it, and kept in its place by nails. It was essential that the window should be kept stiff during the leading-up. Every joint was soldered, so as to unite the disjointed pieces. The soldering was done on both sides of the glass. To finish the work a cement, composed of boiled oil and white lead, was rubbed well into all the leads on both sides. This cement, when hard, had the effect of stiffening the work as well as making it weatherproof. The lecturer then, in closing his demonstration, observed that it was not necessary for an architect to know much of the craft in order to give directions for such work. A slight knowledge of what was done in the process would be enough. The craft conditions were always necessary for good work, and, whatever might be the view taken by architects, it would be well for them to have such a knowledge of the craft to turn it to account if the occasion offered.

The Chairman said the lecturer had asked why they wanted to know anything of the craft. He (the speaker) thought that if there was one subject which architects knew little about, it was glass painting; and thus it was that great ignorance was often observed in the treatment of such work, simply because they had not grasped the craftsman's idea of his work. They knew that very often the men who made good sketches of glass-work were unable to do the actual work, of a window. They were trying to get in a small way a thorough knowledge of what they dealt with in their own art, and glass-work had so much of the artistic that it appealed perhaps more to the architect. There was great controversy among glass painters as regarded the proper process to be followed in such work, and it really seemed to depend largely upon the taste of the design. Architects did complain against the cementing of the windows; it was often far from weatherproof.

Mr. Francis Bond agreed with many of Mr. Whall's remarks. The introduction of complete scenes in stained-glass windows was a mistake; they were illegible. Ordinary painters' works were not adapted to be taken as models for stained-glass; groups of figures were out of place.

Mr. H. W. Pratt, who proposed a vote of thanks, said he gathered from the lecturer that architects were not expected to do designs in stained glass, and therefore it seemed questionable how far a knowledge of the craft would be serviceable to them. He thought that an architect should have a voice in such matters, as to the subject to be introduced and the scheme of colour. It seemed that if architects learnt only as much as could be acquired by students in a craft school, they would be unable to decide upon such important questions as arose in elaborate subjects. For an architect, one of the important points was the relation between the leading and the lines of the window, for one could counteract the other; and the question was, which should be held to be subsidiary. It would be desirable for the architectural student to possess a knowledge of colour and design.

Mr. Francis Hooper seconded the vote of thanks.

Mr. A. S. Flower said he would like information concerning wiring, whether it was always indispensable, and also the width which it was desirable to have for leading.

The discussion was continued by Messrs. D. T. Fyfe, Mat Garbutt, T. G. Lucas, H. J. Leaning.

Mr. Whall in reply expressed his thanks for the interest taken in the subject. There was an objection to the introduction of pictorial scenes with many figures, but the practised artist was able to express the effect which they produced by means of a few figures. The cloudiness in glass, which was so much admired, was one of the consequences of age; the surface

became decomposed, and chemical effects followed which imparted variety. Some streaky glass might be due to accidental causes, but it could be made to order, and it was a useful aid to the artist. With regard to leads, in arranging a composition care should be taken to distribute them as evenly as possible over the surface. Mr. Whall said that, for his part, he would gladly dispense with the protection afforded by wire, but when they remembered what boys could do it became a necessary evil. Rolled glass could be employed, but that had also great drawbacks. In many country districts wire was unnecessary. Lead could be obtained of various thicknesses, and the size would depend on the treatment of the design. The leads, it should be remembered, gave emphasis to a window, and the artist must decide the degree of force which was desirable. Mr. Whall said he was engaged on a large work, and he hoped to be able to explain to them the operations as exemplified on an expensive scale. That night he only showed them students' work. They were not all of them designs for complete leaded lights, but were most of them patterns made for diapers, "apparels," clasps and jewellery on robes; for quarries, canopy, and architectural details which enter largely into the production of figure work in stained-glass.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute was held on Monday evening last at Conduit Street, W., Professor Aitchison, R.A., president, in the chair.

The President announced that the Council's nominee for the Royal Gold Medal was Mr. G. F. Bodley, A.R.A.

A paper by Mr. A. Hessell Tiltman was read on

Public Baths and Wash-houses.

The author opened his paper by an expression of his personal views upon the ordinances which should govern the arrangement of baths and wash-houses in the future, and their influence upon the arrangement and details of the various departments. The Baths and Wash-houses Act, 1846, was passed "to encourage the establishment of public baths and wash-houses." Under this and amending Acts a large number of these establishments had been erected. The municipal duty, however, of providing facilities for the cleansing of the bodies and linen of the poor had not been adequately performed. Statistics showed that only a small proportion of the class for which these establishments were chiefly intended availed themselves of the opportunities offered. The reasons for this partial failure, the author considered, were—first, that the initial distribution and classification of the establishments were frequently at fault; secondly, sufficient effort was not made to educate the masses as to the necessity and benefits of the bathing habit. The bathing community to be catered for consisted of the middle-class, the working-class, and the very poor. A great initial blunder was committed in associating these, in large proportions, for all purposes of swimming, bathing, and washing, in almost every establishment. The remedy lay in the practical adoption of some system of central and branch establishments, classified and distributed to suit the special needs of each district. Ablutionary baths and public wash-houses should be decentralised and located at much more frequent intervals throughout those districts requiring them, forming a series of branch establishments; whilst swimming-baths should constitute centralised establishments at one or more points, equally dividing up the whole district. The author then enumerated the requirements of the suggested establishments. The central establishment should be the chief and most attractive. The branch establishments should consist of two types; (1) baths and wash-houses; (2) people's baths. Either type could be put up on the site of from two to four small houses in a bye-street, which would be neither costly nor difficult to acquire. In extending the provision of baths and wash-houses the authorities should consider the advisability of doing so in the direction of branch rather than central establishments. The author had visited and inspected a very large number of baths and wash-houses throughout the United Kingdom and in France, Belgium, Germany, Austria, and Hungary. In Germany he had found much to admire in the arrangement and administration of those institutions by the State, and the true spirit and intention of the Baths and Wash-houses Acts would be much better carried out if part of the German system were adopted. A committee of medical and other experts in New York, after careful investigation, had reported their preference for the arrangement and administration of the new form of German and Austrian "people's baths." The distinguishing features and hygienic advantages having been fully explained, the author went on to describe the plan and arrangement of each of the three classes of typical establishments advocated by him. The central establishment site should have a superficial area of from 30,000 to 40,000 square feet, be in a prominent position, and easily accessible from all parts of the town or parish. It should admit of the perfect drainage of all portions of the establishment without necessitating an expensive treatment of levels of the building generally. Much saving may be effected by having only a small frontage towards the main thoroughfare. A good site may often thus be secured, carrying with it sometimes sufficient frontages to back streets, where minor entrances may be provided. In baths carried out for the Islington Vestry the author had adapted, the quadrangular system to such a site as that described, with excellent results. The water-supply must be abundant, pure and soft. It should be sufficient to meet the largest demand, and include a storage for some 15,000 to 20,000 gallons. Ponds of very large size are not advisable. It is better to increase their number rather than their dimensions when the latter exceeds 90 feet by 30 feet. Five is a useful number for central establishments: two for each of the sexes, and a fifth or small pond to be used alternately for both sexes, principally as a teaching-pond. In England swimming-baths were usually closed during six months of the year; but with adequate warming and other arrangements—as in Germany, where, though much colder, swimming-baths were open all the year round—swimming-clubs would gladly use them throughout the winter months. The arrangement of one of the swimming-baths during the winter months for public entertainment purposes was next considered, and the best means of meeting the County Council requirements in the matter of exits, &c. Taking into account costly sites, the extra space secured, the advantage to exterior architectural grouping, the author preferred to distribute the baths between the ground and first floors, and, if proper lighting can be obtained, the basement as well. Much accommodation is lost and convenience sacrificed by keeping all the slipper-baths upon one floor. The location of hot-air baths, laundry, boiler-house and engine-rooms, apartments for superintendent and engineer, &c., having been indicated, the author went on to deal with the details affecting the various departments, viz. swimming-baths for both sexes, douche or cleansing-rooms, seippe and rain-douche baths, hot-air baths, the establishment working department, boiler-house, engine-room, accumulator-room, receiving-room, wash-house, drying-room, folding and distributing store-rooms, mess-room, engineers' workshop, and the administrative department.

A defect requiring correction in English swimming-baths was the insufficiency of dressing-box accommodation in proportion to the superficial area of pond surface. The almost universal arrangement of placing the dressing-boxes down two sides, and possibly one end of the hall, must be improved upon. This might be done by adopting the Continental method of placing an equal proportion of the dressing-boxes or places upon the gallery floor, or by arranging them in a series of transeptal bays upon one or both sides of the bath. The pond should be rectangular in shape, and in the proportion generally of length to width as three to one. Steps to the water should be of wood, and made removable. An open self-draining channel, close to the top of the pond and running continuously round it, serves as a scum overflow and spitting-trough, and a suitable height above the water-line an iron or copper safety rail should run all round the pond for the use of tired swimmers. At the shallow end a portion of this rail is usually converted into a spray pipe, extending the whole width of the pond. By raising or depressing the direction of the perforations in this, a useful and pleasant means of freshening and clearing the top surface of the water is obtained. Further points considered in this connection were the depth and temperature of the water, gangways round the ponds, flooring materials, dressing-boxes and their fittings. An important feature of the swimming-bath should be the douche or cleansing-room. This is almost unknown in this country in connection with swimming-baths, but it is a universal provision of the German baths, and used by every bather as a matter of necessary routine, it being understood that before entering the swimming-pond he should, out of consideration for his fellow-bathers, undergo a thorough cleansing process.

Hot-air baths should be upon the lines of the improved form of the Anglicised Turkish bath, consisting of three rooms, viz. the tepidarium, 140 deg. Fahr.; the calidarium, 180 deg.; and the laconicum, 250 deg.; together with a combined cooling and dressing-room, and a shampooing and douche-room. For the second-class hot-air baths the author recommended the system suggested in Metcalfe's "Sanitas Sanitatum et Omnia Sanitas," which consists of a combination of hot-air rooms of the Turkish bath, with a system of warmed lavatories in lieu of the shampooing process and plunge bath. This modification of the Turkish bath, for ordinary purposes of ablution, would be perfectly effective, less provocative of colds, and more economical than the ordinary warm slipper-bath.

In considering the second part of his subject, "Public Wash-houses," the author said that their present arrangement required complete overhauling. Full details of a small installation were given as an indication of the line modification should take. The following rooms were described and illus-

trated :—Public wash-houses, mangling-room, waiting-hall, cloak and bonnet-room, crèche, ticket-office.

Reverting to bathing establishments, the author explained that the smaller type of his branch establishments, viz. people's baths, was intended to meet, in the cheapest and simplest manner, the needs of the very poor for cleansing facilities. It consisted of very small establishments of rain-douche baths built at very frequent intervals in the poor and populous districts, after the manner of the Germans and Austrians. These establishments could be made so small and compact as to permit of their erection under our streets in a manner similar to our underground lavatories and conveniences.

Finally, the author touched upon construction and architectural treatment. Construction should be of such a character as to resist the action of water in every form, whether from carelessness or from the necessities of frequent cleansing. It should be easily kept clean, free from vermin, and especially so with respect to the transfer of contagious matter. As to external architecture, the design of the building should clearly express its purpose quite apart from all questions of style. It should appear exactly what it is, and not ape the dignity and expression of the modern town hall. In the treatment of the natural outcome of the plans there are infinite opportunities for original and distinctive treatment. The paper was illustrated by a large collection of plans of baths in England and on the Continent, including the Kennington Road Baths (of which photographs of the interior were shown), Hornsey Road Baths, Tibberton Square Baths, River and Public Baths at Hamburg, and "people's baths" at Hamburg and Vienna.

Mr. W. Emerson proposed a vote of thanks to Mr. Tiltman for the paper that had been read.

Mr. H. L. Florence seconded the vote, which was supported by Messrs. A. J. Bolton, Saxon Snell, jun., and Professor Aitchison.

THE ABBEY MANSIONS, WESTMINSTER.

ON Monday, in the Queen's Bench Division, before Mr. Justice Lawrance and Mr. Justice Channell, the special case, Drury *v.* Rickard, stated by a metropolitan magistrate, raising a question whether the Abbey Mansions, Victoria Street, were vested in and were in the occupation of a Government department, was heard.

A complaint was made by the appellant, Mr. Dru Drury, district surveyor, under the London Building Act, 1894, that, in erecting a certain building known as Abbey Mansions, north and south blocks, situate at Victoria Street, certain things had been done in contravention of the said Act by the respondent. The respondent was a builder employed by C. J. C. Pawley, and was engaged on June 1, 1898, in erecting the south block of the building in question. It was erected to a greater height than 80 feet without the consent of the London County Council, and, if the Act applied, in contravention of section 47 of the Act, which states that a building (not being a church or chapel) shall not be erected of or be subsequently increased to a greater height than 80 feet (exclusive of two storeys in the roof, and of ornamental towers, turrets, or other architectural features or decorations) without the consent of the County Council. A notice of irregularity was served on the respondent, who claimed that, by reason of section 202 of the Act, the building was exempt from the operation of the Act. That section contains the following provision :—"There shall be exempt from so much of the provisions of this Act as relates to buildings and structures . . . any building, structure, or work vested in and in the occupation of any department of Her Majesty's Government." The respondent was erecting the said building for, and under the supervision of, C. J. C. Pawley, who was acting as architect of the building, but subject to the approval of the Surveyor of the Commissioners of Her Majesty's Board of Works. The agreement between Pawley and the Commissioners was made on November 19, 1897, and Pawley (therein called the landlord) agreed to grant, and the Commissioners agreed to take, a lease of a piece of land with the messuage therein described as then in course of erection "for the term of twenty-one years, from December 25, 1897, or so soon thereafter as the buildings should, in the opinion of the officers of Her Majesty's Office of Works, be fit for occupation." No such certificate had been given by the officers of the Office of Works, and the Commissioners had now refused to take the buildings. One of the officers of the Commissioners of Works had on several occasions during the building visited the buildings and made suggestions. The appellant contended that the buildings were in the occupation of Pawley, and not in that of any Government department, and at any rate would not vest in the Government until the commencement of the term of twenty-one years mentioned in the agreement. The magistrate was of opinion that the building came within section 202, and was, therefore, exempt. He accordingly dismissed the complaint, but stated a case for the opinion of the Court upon the question whether the buildings were exempt. Other questions were raised before him, but their decision did not become necessary if his view was right.

Mr. Daldy, for the appellant, said that the buildings were not exempt, and the respondent should have been convicted. The magistrate thought the whole question turned upon the construction of the agreement, and did not consider the circumstances of the case, which showed that the Government were not in occupation. The Government had agreed to take a lease from a date which might not arrive at all, and had not arrived in fact yet. Therefore there was no vesting of the buildings in the Government. The premises were occupied, if by anybody, by the builder. The only evidence of occupation by the Crown was that the surveyor would occasionally visit the buildings. Under the statute there must be both vesting in and occupation by the Crown. The lessees of Crown property generally ought to be liable to the provisions of the Act. Perhaps that was the reason why the clause was put into the Act in this form.

Mr. Avory said the exemption given by the Act could not apply at all if it did not apply to buildings in course of construction, because no Government department could enter into occupation until the building intended for it was completed. The clause meant that if buildings were vested in Government and intended for the occupation of a Government department, they should be exempt, otherwise the section would be of no effect. They might also be said to be in occupation by reason of the Government surveyor coming in. That, however, was the smaller point. The building was also vested in the Government. The document was a lease in equity. If the Commissioners could compel the grant of a lease, then the property vested in them. He contended that they could enforce a lease.

The Court held that the case must go back to the magistrate to decide the other points which he had not dealt with.

Mr. Justice Lawrance said that it was impossible to say that the buildings were "vested in and in the occupation of any department of her Majesty's Government." The magistrate was therefore wrong in the view he took

Mr. Justice Channell concurred. Difficulties had been pointed out by Mr. Avory as to the occupation of Government departments in buildings that were being built for them by contractors. If, however, there was in any real sense a vesting of the buildings in Government, it would probably be held not to be very difficult to make the occupation sufficient. He could not, however, see the equitable interest here. The contract was this: that the Government would take the buildings for twenty-one years from December 25, 1897, or so soon thereafter as the buildings should, in the opinion of the officers of Her Majesty's Office of Works, "be fit for occupation." There was, therefore, no compulsion on the Government to take the premises until the opinion of the officers that the buildings were fit for occupation had been given. Where there was an option of that description no equitable interest arose until the election had been made. No case had been cited to contradict that view. It followed that these buildings were not vested in the Government department, and the matter must therefore go back to the magistrate.

THE VALLEY OF THE DOUGLAS.

THE sixth meeting of the session of the Lancashire and Cheshire Archæological Society took place on the 2nd inst., Mr. A. M. Robinson presiding. A touching tribute was paid by the chairman and other members to the memory of that prominent member and profound archæologist, Mr. E. W. Cox, who passed away early on the 1st inst. a victim to pneumonia. After the formal business had been disposed of, Mr. C. Shaw passed round for inspection an autograph letter of William Roscoe and one of his election talleys, kindly lent by one of his descendants. The paper of the evening, on "The Valley of the Douglas," was read by Mr. Wm. F. Price, who commenced by giving a general description and history of this interesting valley, assisted by the aid of several large maps and plans, and afterwards a detailed account was given of the Cymro stones, supposed to be Celtic, Battle Holme, said to be the site of one of King Arthur's battles, and an account of Newburgh, a place of great antiquity, with its ancient fairs, old country customs and sports, the ancient schools and houses, interspersed with many anecdotes of country-side celebrities and original characters, superstition and uncanny stories. A long discussion took place, in which the chairman, Mr. W. E. Gregson, Mr. W. F. Irvine, Mr. S. May, Mr. R. Bennett and Mr. Madely took part, and a vote of thanks, proposed by Mr. John Hargreaves, and seconded by Mr. C. Shaw, was heartily accorded to Mr. Price for his interesting and original paper.

The Edinburgh Architectural Association's first visit of the session takes place to-morrow (Saturday), and will be to Tollcross cable-power station.

NOTES AND COMMENTS.

SEWER construction is a class of work which offers temptations to dishonest contractors and to workmen who have a grudge against their employers. We cannot say in England that neither class of men have not succumbed. The Municipal Council of Paris have now a serious case of the kind under consideration. The works for the underground railway interfered with the sewers, and a great many have had to be reconstructed. It appears that in several cases the new sewers are only shams. The materials specified were not used, and the construction is most careless. From the character of the work the existence of the sewers could only be of a brief duration, but meanwhile they were sure to imperil the health of the people in the streets near them. One of the misfortunes of France is the army of officials that must be employed to reward political services, and the number of overseers for the sewers of Paris would be considered disproportionate even by the London County Council. But it appears that from among them not one report was received concerning the malpractices which were continued without interruption. If it were not for one of the workmen who "split" on his fellows the sewers would have passed into the possession of the Municipal Council without any misgiving being raised about the character of the work. It is possible that in Paris, as elsewhere, many of the overseers did not possess much knowledge about construction of any kind. But any man who was endowed with ordinary intelligence could have perceived the offence of foisting one material for another. Advanced politics in such cases, however, insures condonation.

ALL our readers who have visited Lille can recall the marvellous WICAR collection of drawings in the Art Gallery. Among the designs are several of an architectural character which are by many supposed to be drawn by MICHEL ANGELO, with others prepared for him by the faithful GIORGIO VASARI. There are also studies by DA VINCI, RAPHAEL, TITIAN, CORREGGIO, the CARRACCI, TINTORET, PAUL VERONESE, &c. It is doubtful whether a more valuable collection of its class is to be found in Europe. M. WICAR, who was during the greater part of his life engaged in amassing the treasures, was an historical painter. He was a native of Lille, which he has so munificently enriched. His bequest was not to the city, but to the local "Société des Sciences, de l'Agriculture et des Arts." The Society allowed the city to exhibit the collections, but reserved the ownership. In 1866 it was arranged to renounce the latter on condition that the annual allowance from the Municipal funds should be increased from 3,500 francs to 6,000 francs. The latter sum was duly paid until 1897, and it enabled the Society to offer prizes to students, the most important being the Prix Wicar, by means of which a young artist is enabled to spend a year in Rome. In 1897 the socialist party possessed a majority in the Municipal Council, and the arts were despised. Accordingly, it was decided to reduce the subsidy to 3,000 francs, on the ground that no formal agreement for a higher sum existed. The Society appealed to the law courts. The case was tried a week ago, when the tribunal declared there was a contract to pay 6,000 francs a year, and the sum must be entered in each year's budget.

THE relations between France and Russia are so precarious in character, although the mob suppose they are eternal, that any little incident in which they are involved is liable to be misinterpreted. An instance has just occurred. The Pont Alexandre III., now in course of construction across the Seine, in Paris, was to have two statues flanking the approach at each end. They were to express the alliance of France with Russia. But artistic inspiration is not always subservient to politics, and although they have cudgelled their brains the sculptors find that ideas are coy. The symbolic figures that have been devised are not suggestive of much profit arising to France from their confidence in the "Frenchmen of the North." Accordingly, it is now proposed to substitute for statues shields or cartouches bearing the arms of the two nations. The arrangement shows wisdom on the part of the authorities, for a printed label is preferable to a statue that is mere task-work. But some of the Paris journals gave a political aspect to the affair. They said that the architects who are charged with the decoration, recognising the unstable nature of the union between France and Russia, had anticipated that a day might come when all memorials of it would be hateful to French eyes, and then popular fury would play havoc with the statues. As we have said, there is apparently no ground for that supposition, but to assume that Parisians would not hesitate to become vandals and destroy symbols of Russia cannot inspire much confidence in St. Petersburg.

THE church of St. Eustorgio is not always visited by tourists in Milan. It is, however, an interesting building, and although mainly a mixture of work of the thirteenth and seventeenth centuries a church stood on the site from the fourth century. The Dominicans obtained possession of the old church soon after the founding of the Order, and one of the monks attached to it was the St. PETER whose murder formed the subject of one of TITIAN'S masterpieces, which was consumed in 1866. A chapel was dedicated to the saint; it stands behind the choir in St. Eustorgio. It formed the subject of a lecture which was given on the 2nd inst. in the Dublin Museum by Count PLUNKETT. He said that the chapel properly belonged to the transitional period, and in it were to be found details of Gothic and Romanesque. The interior of the chapel is beautiful, and at the front of the apse is the sarcophagus-shrine of the martyr, which was transferred from St. Eustorgio. There are also wonderful paintings by CIVERCHIO, a pupil of FOPPA, who was considered to be one of the finest painters of his time. CIVERCHIO painted the Annunciation over the arch of the apse. This fresco is gracious and spiritual in character, excellent in modelling and colour. The other frescoes in the lunettes to the right and left are inventions of the artist himself, and in those four pictures the life of the saint and the mission of his life are summarised. In conclusion, Count PLUNKETT observed that the architect, the sculptor, the modeller, the painter and the artisan had worked together to make the little chapel so perfect that it seemed to be the work of angels rather than of men.

BIRMINGHAM is about to expend a large sum on public works, which cannot be longer delayed. There, as elsewhere, more accommodation is needed for the increased number of lunatics, which is not to be kept down by any expenditure on education. Tenders are sought for the new Hollymoor Asylum, which, at the rate of from 200*l.* to 250*l.* a bed, will cost about 150,000*l.* If private patients are admitted the Lunacy Commissioners will insist on a separate building, and a larger outlay is therefore to be expected. A new cattle market is to be constructed in Montague Street, at an estimated cost of 9,957*l.*, with 750*l.* for architect's commission, &c. Improvements at Smithfield are also to be realised. The Corporation require to be expeditious in carrying out alterations, for the value of property is ascending in Birmingham. For the freeholder's interest in a public-house and three shops in Colmore Row, which produce 750*l.* a year, 30,000*l.*, or forty years' purchase, must be paid. The price per square yard is 105*l.* The leaseholder's interest has yet to be reckoned. The City Council, having obtained land in Edmund Street at a high rate, are receiving suggestions for its utilisation. There are many citizens who are in favour of the erection of a Natural History Museum on a part of the ground, and it may be assumed that the building will be undertaken shortly.

ST. GEORGE'S SCHOOLS, SOUTH STREET, MAYFAIR, W.: SOUTH FRONT. NORTH FRONT.

THIS group of Higher-Grade Schools was recently erected by Messrs. DOVE BROTHERS from designs by Mr. PHILIP A. ROBSON, A.R.I.B.A., and which gained first place in the competition. On some of the plates Mr. E. R. ROBSON is erroneously described as architect. The fireproof flooring is by Mr. PICKING, and the wood-block flooring by the Acme Company. N.A.P. are used.

THE SUPERVISION AND REGULATION OF BUILDING OPERATIONS IN ENDINBURGH.*

(Concluded from last week.)

AS I have already stated, the legal propositions of a petitioner are these :—This is my property, the proposed operations are confined to that property, they can be executed with safety ; therefore I am entitled to warrant. The objections which may competently be stated against these propositions are separable into two classes—legal and practical. Into the first category fall the objections usually taken by neighbouring proprietors, viz. that the property does not belong to the petitioner, that the operations are not confined to his own property, or that they will interfere with some right or servitude belonging to the objector ; and also the objections competent to a superior that the conditions of the feu charter are not being complied with. In order that you may understand the terms superior and feu charter, let me explain that in Scotland leasehold of property is almost unknown in the sense in which the term is used here. The tenure of heritable property with us is almost wholly feudal. The owner of land in Scotland is called the superior, and when he disposes of a portion of his ground for building purposes, he does so in terms of a feu contract entered into between himself and the intending builder, who becomes in law, his vassal. This vassal binds himself and his heirs in perpetuity to pay to the superior and his heirs an annual ground rent or feu duty as the consideration for being allowed to erect a building on the ground, but the right of property in the house or building belongs for ever to the vassal, his heirs and successors. Of course, in granting this feu charter or contract, the superior may impose such conditions on his vassal as he may consider desirable. He may describe the class of property to be built—in the case of dwelling-houses whether they shall be villas or tenements—or, as is often done in Edinburgh in streets of high-class houses, he may insist on the elevations being built conformable to a particular design. He may prohibit the carrying on of any trade or manufacture in property on his ground, and he may constitute a servitude of light and prospect over one house or building in favour of another.

As it is a matter of considerable importance to anyone interested in building operations in towns, perhaps I might at this point inform you as to the Scots law in reference to servitudes or easements.

First let me explain that the tenement having right to the servitude is called the *dominant*, that subject to its burden the *servient*.

Prædial servitudes, as servitudes attached to heritable property are called, are either positive (where the dominant proprietor has right to exercise some right) or they are negative (where he only restrains the servient proprietor) ; and negative servitudes cannot be acquired by possession, but are constituted by title alone. The owner of a servient tenement is only bound to *suffer*, he is under no obligation to do any act. He must do nothing to limit the servitude, but beyond its proper limits he is free; while the owner of the dominant tenement cannot increase the burden. The urban servitudes are—(1) Support, giving the right to rest the dominant tenement against the servient ; (2) Stillicide, the right to send the water from the roof of the dominant tenement on to the servient property ; (3) light or prospect, whereby buildings are prevented from obstructing the light or prospect of the dominant tenement ; and (4) *altius non tollendi*, not to build above a certain height. Probably there is a general resemblance between the law of England and of Scotland on this subject, but one important difference at least exists. In England a servitude of light may be acquired by usage for, I think, twenty years ; but with us such a servitude can never be thus established. In Scotland, if any building is to have a servitude of light and prospect over an adjacent building, it must be expressed in the title to both properties. The theory in Scots law is that a proprietor is only bound to provide light and air for his own property, and any open space which he may leave is not to be reckoned on by his neighbour to provide him with light. A common result of this is that a man who has built up to the boundaries of his property some day finds the windows on one side of his property closed up by a building of his neighbour's, and the law provides the neighbour with no remedy because in building he ought to have left sufficient open space to supply his house with light and prospect if he wished it.

This appears to me to be an important difference between the laws of the two countries, and I must say we seem to take the more equitable view of the matter. With regard to the other classes of servitudes, I know of no other marked difference in our practices, so I need not more particularly refer to them.

The questions, then, between conterminous proprietors and between superior and vassal supply the grounds of the legal objections to a petition in the Dean of Guild Court, and I shall now go on to deal with the second class—the practical.

Objections of this kind are naturally mainly taken at the instance of the Court itself. A respondent may, of course, bring under the notice of the Court any apparent weakness in construction, and the Court, if satisfied that the objection is well founded, will take care that the deficiency is remedied ; but for all practical purposes I may say that an absolute discretion in these matters is vested in the Dean of Guild Court, and their judgment will not be called in question. The same remark applies to the powers conferred and the responsibility devolving upon the Court by statute, and these may not be filed by the respondents. By this I mean that it is not competent for a respondent to plead that the provisions of the Act are not being complied with, as it is assumed that where these requirements are absolute the Court as a matter of course will see that these are given effect to, and, where the powers are discretionary, that discretion is entrusted to the Court and may not be called in question.

I shall briefly review these statutory powers of the Court, as I believe they may be of interest to you.

First, there is the specification of the plans to be lodged, which I have already read to you, and the approval of the material to be used in elevations.

Then comes an important section dealing with open spaces in rear of houses, which provides that :—

"Every new house, and any building altered for the purpose of being used as a house, shall have in the rear thereof, or directly attached thereto, and pertaining to and used exclusively in connection with such new house, or building altered for the purpose of being used as a house, an open space at least equal to three-fourths of the area to be occupied by the intended house where such house is not of greater height than four storeys ; and where such house shall exceed that height such open space shall be of equal area with that of such house ; and such open space shall be free from any erections thereon other than water-closets, coal-houses or other conveniences to be used in connection with such house, all which conveniences shall as to height, position and dimensions be erected subject to the consent and approval of the Dean of Guild Court ; provided always that in any case where the thorough ventilation or light of any house or building is, in the opinion of the Dean of Guild Court, otherwise secured, or under other special circumstances the said Court may, in their discretion, allow the open space to be reduced ; provided also that in the case of the erection of houses with shops on the ground-floor, or of the conversion of a house into a building to be used for business premises only, the Dean of Guild Court may sanction the erection of saloons upon such open space of such height and construction as to them shall seem proper, such saloons to continue so long only as such building is so used for business purposes. But where any building is to be used for business premises as much open space shall be required as, in the discretion of the Dean of Guild Court, shall be sufficient for the purposes of light and ventilation, but not exceeding the extent required by this section in the case of a house. Provided further that from and after the passing of this Act all existing houses having any open space adjacent thereto shall, as regards such open space, be subject to the foregoing provisions of this section, applicable to new houses to the extent to which such open space is available. Provided further that the provisions of this section with respect to such open space shall not affect any feuing plans which, prior to the passing of this Act, have been submitted to and approved by the magistrates and Council, in which a less open space than is in this section prescribed has been so approved."

Then there is a provision in regard to the building-line of houses.

Also in all cases where it is proposed to alter or take down in whole or in part the front wall of a house or building which has in front thereof a sunk or other area or garden plot, and to bring the same or any part forward so as to build or cover over such area or garden plot, or any part thereof, the outer line of the front wall shall not extend forward beyond the middle or centre line of the existing wall of such area or garden plot.

In every new house, and in every building altered to be used as a house, every habitable room, except attic-rooms, shall be in every part thereof not less than 9 feet in height from the floor to the ceiling ; and every habitable attic-room shall, unless otherwise sanctioned by the Dean of Guild Court, be at least 8 feet in height from the floor to the ceiling throughout not less than one-third of the area of the room, and shall at no part thereof be less than 4 feet.

In every new house, or altered building to be used as a house, every habitable room shall have at least one window, and the total area of glass in the windows, clear of the frame and sash, shall be (unless in any case the Dean of Guild Court otherwise determine) at least one-tenth of the area of the room, and the top of at least one of the windows shall not be less than 7 feet 6 inches above the floor, and in case of a sash window the upper half at least shall be made to open the full

* A paper by Mr. David Lyon, read at the meeting of the Society of Architects on Jan. 26.

width, and in case of a casement window one-half at least shall be made to open.

Then there are provisions as to buildings causing extra risk of fire, chimney stalks for furnaces, buildings for noxious trades, the height of rooms in dwelling-houses, and the ventilation of enclosed spaces—that is, where a person proposes to erect a block of buildings enclosing a space containing an area of less than 2,000 superficial yards, and being less than 40 yards wide at the narrowest part.

Finally, there is the general power to decline to grant any warrant until the Court is satisfied that the plans provide suitably for strength of materials, stability, mode of access, light, ventilation and other sanitary requirements, and are otherwise in conformity with the provisions of the Edinburgh Municipal and Police Acts.

I think you are now fully informed as to the requirements of the statute, and also as to the kind of legal objections which may be raised against a petition, and I may now complete my account of the procedure in the Court.

First we shall assume a case in which no respondent is appearing. If the Court, on consideration of the burgh engineer's report and examination of the plans, finds that these are deficient in any respect, they will indicate this to the petitioner, and there and then allow him an opportunity of amending the plans. If he comply, warrant will be granted. If he will not comply, and asks the Court to deal with the plans as they stand, the Court will refuse warrant, stating, of course, the ground of refusal. This judgment is written on the petition and signed, as all deliverances of the Court are, by the Dean of Guild. I may say that it has been decided that the Dean of Guild Court may not refuse a warrant without stating clearly the grounds of refusal.

Next we shall assume a case in which the Court is satisfied, but in which the Corporation appears as respondent and takes the objection that in some respect the petitioner has failed in his obligations to the city authorities, such as that his building is higher than he may erect it without the consent of the Corporation, then the Court will continue the case until the consent of the Corporation be obtained. In the event of a refusal to do this or to modify the plans warrant will be refused.

Lastly, we shall assume a case in which the Court and the Corporation are both satisfied, but in which a neighbouring proprietor appears and states a legal objection. In this event also the Court may adjourn the case to allow the petitioner an opportunity of amending his plans or of coming to terms with his neighbour, but, failing this, written pleadings have to be prepared on both sides and titles lodged. When the parties have completed their pleadings and adjusted the issues, as it is called—that is, made a complete record of the arguments on both sides—the case is remitted to the legal assessor of the Court.

A date is fixed for a debate before him by the lawyers representing the parties, and, having heard them and examined the titles, he writes an opinion on the case, in accordance with which the Court issues judgment. The Court does not review or in any way interfere with this advising by its legal assessor; it simply accepts it, and issues judgment accordingly.

Of course, as I have already said, if there appears to be a competition of title, the assessor will advise the Court to delay the case until the parties have in a competent Court decided the question of the rights of property in the subjects under consideration. When that has been done, if the petitioner has succeeded in vindicating his title, the Dean of Guild Court will naturally, other matters being adjusted, grant warrant. If the petitioner has failed, he will not proceed further with his petition.

Before leaving this part of my subject, I ought to say that in the Dean of Guild Court there is practically never a proof or examination of witnesses. That it is competent there is no doubt, but in my twenty-six years' experience of the Court I have only known of one case in which a proof was allowed, and then it was not taken advantage of by the party applying for it. But it is usual, if either of the parties desire it, or if the Court deem it expedient, for the Court to visit and inspect buildings proposed to be altered, in order to better understand the effect of the proposed alterations. It will be obvious to you that in dealing with practical questions no extraneous evidence is necessary when the men of skill composing this Court, possessed of every qualification to form a sound judgment on such matters, personally visit a property and satisfy themselves as to the state of the building and the bearing of the petitioner's proposals on it and on the surrounding properties. At these visits all parties interested may attend.

That, then, is a general account of the mode of procedure in the Court. If, however, any petitioner or respondent is dissatisfied with a decision of the Court, he has the right to appeal, and the Court of Appeal is the Court of Session, our highest legal Court, there being no Special Court of Appeal for Dean of Guild Court cases.

As I have indicated, it is rather a forlorn hope to appeal to the Superior Court on a purely practical point, because the Supreme Court is a court of law, and will not interfere with the judgment of practical men on practical questions. But, as you have seen, the Court has many statutory powers, and the construction of an Act of Parliament is always open to argument; so that the petitioner, in the case of the refusal of a warrant by the Court, may consider that its interpretation of the law is wrong, or that the law does not confer on it the power which it has exercised; or in a case where purely legal objections have been taken either party may hold that the advising by the legal assessor is wrong in law. In any case the appeal is to the Court of Session, and as that is a purely legal tribunal I need not deal with the procedure there further than to say that when they find that the Dean of Guild Court has gone wrong, which I am pleased to say in the case of Edinburgh has been very seldom, they recall the judgment of the Dean of Guild Court, and remit back the case to that Court for further procedure, as it is called, on the lines indicated by the decision of the Superior Court.

The judgment of the Superior Court itself, however, is in these cases, as in all others, subject to appeal to the House of Lords—and some of our cases have actually gone that length—but I am sure you will be glad to hear that at this point the possibilities of litigation have reached their limit, and the decision of the House of Lords is final.

I shall now deal with the supervision of buildings in course of erection or alteration after warrant has been granted. The duration of a warrant is by law limited to three years from the date of granting, with the proviso that in an exceptional case the Court at the time of granting may extend the time of endurance to a period not exceeding five years from the date of the warrant, and also that the period of endurance of any warrant may, in the discretion of the Dean of Guild or his Court, be renewed for a period not exceeding three years from the date of renewal; also that the person by whom, or under whose orders, any house or building is being erected or altered, or any work done, if other than the petitioner in whose favour the warrant of the Dean of Guild Court has been granted, shall be liable for the due observance of the terms of such warrant. This is necessary because, in some cases, the person who obtains the warrant disposes of the ground on which he proposed to build or of the building which he proposed to alter, and hands on his warrant to the purchaser.

Before any building operations are commenced the petitioner must intimate his intention of beginning to the clerk of Court, who passes on this intimation to the Master of Works, along with the plans to conform to which warrant has been granted. It is now the duty of the Master of Works to inspect the building from time to time, and satisfy himself that it is being erected in conformity with the plans and also with the building rules, which must be observed in all cases, and a copy of which is attached to the warrant when it is issued to the petitioner.

Then within a month after any new house or building or alteration is completed, and before it is occupied, the owner or the builder must intimate that the building is ready for inspection before being occupied, and the Master of Works, if satisfied after survey that it is fit for occupation and is in accordance with the provisions and requirements of the law, grants a certificate to that effect, and any owner or builder failing to give such notice or permitting such building to be occupied before obtaining this certificate is liable to be punished. The Master of Works, as I have already said, has a large staff of assistants engaged in this work of inspection, most of whom are men who have been trained in some branch of the building trade, and the supervision of buildings in course of erection and of the materials used is thus in the hands of men who well understand the work with which they are entrusted.

The Court has further the power to punish persons breaking its laws. The Act says:—"Every person who shall erect, or begin to erect, any house or building, or alter the structure of any existing house or building, or use for human habitation any building not previously so used, or alter the mode of occupancy of any existing house in such a manner as will increase the number of separate houses or occupiers without a warrant, or otherwise than in conformity with a warrant of the Dean of Guild Court, and every person who shall in the erection or alteration of any house or building, the erection or alteration of which has been sanctioned by the Dean of Guild Court, deviate from the plan or plans, and section or sections, elevation or elevations, and detail drawings so sanctioned, or shall in the erection or alteration of any house or building in any way contravene the building rules of this Act, shall be liable to a penalty not exceeding twenty-five pounds, besides being bound, if and in so far as required by the Dean of Guild Court, to take down and remove the said house or building, or to restore it to the state it was in previous to the alterations thereon, or to alter it in such way as the Dean of Guild Court shall direct, so as to make it in conformity with the warrant of the Dean of Guild Court; and the Dean of Guild Court may grant an interdict for the prevention of any such erection or alteration or deviation being proceeded with until the extracted warrant of the Court shall be obtained for the same."

And this brings us to the functions of the Procurator Fiscal, it is he who institutes proceedings against the offender, and is with him that any information is laid either by the Master Works or by a private individual in the event of a contravention of the law. If the Procurator Fiscal is satisfied that offence has been committed—and I must tell you that he has discretion on this point—he presents a petition to the Court stating his grounds of complaint, and the offender is summoned the bar of the Court. In the case of a person building or ering property without a warrant, the Court will first ordain n to apply for warrant in the ordinary way, and will then pose a penalty for proceeding without a warrant. In the se of deviation from plans already approved of, the Court ll either ordain him to alter his building in conformity with e plans, or, in the event of the deviation being such an one as e Court would have sanctioned had its authority been asked, e offender is ordered to lodge a plan showing the deviation, t after approval he will be fined for his breach of warrant. ne Court is always ready informally to consider and approve such small deviations in, say, the internal arrangements of a use in course of construction, and the plan of the deviation is ed along with the original plans. What is aimed at is to secure at an exact record may be kept of all building operations, d the existence of this record is being found so valuable to chitects and builders, and indeed to all persons interested d dealing in property, that great readiness is being shown to mply with the wishes of the Court in this respect.

Proceedings are also taken by the Procurator Fiscal in all ses where a building is reported by the burgh engineer to be inous or insecure, and where the proprietors have failed in mpliance with his intimation to repair, take down, or secure ch building. Many of the buildings, especially in the older rtions of Edinburgh, are large stone tenements of dwelling-uses or shops, and dwelling-houses where probably each use and shop is owned by a different proprietor. Consequently, when the burgh engineer serves his notices on the wners of such a tenement which has become insecure, there is ually such a difficulty among them in deciding what should done that nothing is done at all. The burgh engineer, erefore, reports the matter to the Procurator Fiscal, who proceeds by a petition to the Court directed against all the proprietors. He does not stop at this point to inquire into the mount of liability falling on each ; he brings them all into ourt. What is urgent is, that the safety of the public be cured, and the Court visits the building, at once decides on e operations necessary to secure it, and there and then sues an order on the proprietors to carry out these operations. ailing their commencing to do so forthwith, and completing e same within a specified time, the Procurator Fiscal is uthorised to employ proper persons to do the work at the pense of the proprietors. When the work comes to be paid r, the Court will then adjudicate as to the liability of each roprietor, and fix the proportion which he must pay. If an wner cannot be found, as has happened, the Court may dispose of the property, pay for the work out of the proceeds of e sale, and deposit the remainder, if any, in bank, subject to s further order.

Finally, the Court will, on the application of the Procurator iscal, visit and inspect any building used as a place of public ntertainment, and may, after hearing the persons interested, rect such means to be taken for the proper ventilation, or for roviding proper accesses and exits for such building, and for rotection from fire and other dangers to the public, as the ourt think fit.

Now, that concludes my account of the jurisdiction and the unctions of the Dean of Guild Court, and I hope I have been ble to convey to you some idea of the manner in which its usiness is conducted.

I do not need with you to insist on the importance of the natters with which it deals. We are all well aware that, with ne growth of our large cities, with the immense increase of opulation, and with the rapid advance in knowledge of what I nay call the science of living in relation to the public health, ne attention of local authorities everywhere has been directed o the need of controlling the mode of laying out the new ortions of our cities, and of improving the buildings already xisting ; to the securing of light and air and proper sanitary rrangements ; and, generally, to the importance of exercising upervision in all such matters in the public interest, without nterfering unduly with the rights of individuals. To this, as I ay, we are all alive, and of its necessity we are all agreed. Where we differ is in our mode of carrying out these objects.

Lest I, as an official, should be biassed in my opinion, I ave, since I received your invitation to read this paper, licited the opinion of a large number of professional men, awyers and architects, and also of builders, as to the merits f the Dean of Guild Court as a tribunal for dealing with uilding questions, and practically it has amounted to this : hat while the jurisdiction and procedure of the Court might be nproved in detail, it is so far, especially in large cities, where nen of skill and standing are readily available for election to the Court, the best institution for its particular work which has yet been devised.

It has the advantage of providing an independent medium to adjudicate between the petitioner and that much-abused person, the permanent official, and between party and party. All proposals and objections are filtered through the minds of a body of practical men guided in the legal aspect of cases by a legal assessor and restrained by the fact that their business must be conducted in a fair and judicial manner, and that all their proceedings are subject to review by an extremely critical legal Court. The procedure is summary, by which I mean that it is to be conducted with reasonable despatch, and the expense incurred in obtaining a warrant is small—in the majority of our cases probably not exceeding 20*s*.

It has the further advantage of securing a uniformity of procedure in all cases, as, of course, such a Court is bound by its own decisions and by precedent. Above all, its business is conducted in open Court, and all its procedure is public, and that is, in my opinion, one of the best guarantees that onerous public duties like these, discharged by a body of unpaid judges, shall be dealt with justly and equitably without fear, favour, or ill-will.

Finally, may I say that the Court in Edinburgh, both from its constitution and the manner and spirit in which its business has been conducted, possesses, I believe, the perfect confidence of the public, whose interests it safeguards, and of the parties and the practitioners who come before it.

THE LATER ARCHITECTURE OF JAPAN.*

TOWARDS the end of the fourteenth century the dynasty of Fujiwara Shoguns was finally overthrown after almost two centuries of domestic warfare, and a new line was established, that of the Ashikaga, who completely severed themselves from the Imperial Court at Kyoto, and, building the great city of Kamakura far to the north and near the site of the present capital, began a new and brilliant though corrupt and chaotic epoch.

During the two centuries of internal conflict Japan had almost wholly cut itself off from China, the great source of learning and culture, but by the founding of the Ashikaga dynasty intercourse was resumed, and under the influence of the Zen mission temple building began again on new lines, and a recrudescence of Chinese influence came into existence.

At this time the Ming dynasty was striving to restore the almost incredible glories of the Sung dynasty that had made Hangchow the culmination of world civilisation in the twelfth century. For some years Buddhist priests had been coming from China to Japan bringing the new gospel according to the Zen sect, and now, with peace established, their work began to show its results. A new epoch of civilisation, generally called the Kamakura period, set in, and architecture received a new accession of vitality, reaching its last phase of greatness before the first trace of decay showed itself under the Tokugawa Shoguns. Two sets of buildings are most characteristic of this period—the Zen temples and the palace pavilions of Kyoto.

In the former we immediately see certain deviations from the old types. The arrangement of the group of temple buildings is different; there is seldom a pagoda, and the temple and preaching-hall stand one behind the other in the centre of the main enclosure; libraries, schoolrooms and monastic buildings surround this space, and oftentimes open cloisters connect them with the central temples, dividing the entire area into three great courts; minor courtyards with shrines and schools and priests' houses continue the group on either hand in complete bilateral symmetry. In many cases the group of buildings is laid out on a vast and imposing plan, but in almost every instance so many of the buildings have been burned that little idea can be gained of the original design. The gigantic monastery of Obaku-san between Uji and Kyoto, though dating from the middle of the seventeenth century, is perhaps the most complete example of the great Zen temple in Japan.

The low and often long temples of the Corean style give place in the Zen architecture to buildings that are nearly square and very lofty inside. A central space reaches high into the roof, which rests on twelve widely spaced columns, often of great size. One and sometimes two aisles surround this central area, and small shrines, chapels and altars are grouped at the chancel end. The temple itself is raised on a low stone terrace, and the floor is also of stone slabs. Plaster is seldom used, all the work being of wood, and the roofs rise in a steep and graceful curve. The system of bracketing is becoming more and more elaborate and complex, but carving is still almost wholly absent. This is the type of architecture that became fixed in Japan and persevered until the Tokugawa régime, when it burst into such unexampled exuberance and luxury.

* An essay by Mr. Ralph Adams Cram, in the *Architectural Review.*

Of the palace architecture of this time we have still the fragments at Ginkaku-ji and Kinkaku-ji at Kyoto. As both these delicate little structures were originally but garden pavilions, it is possible that they do not exactly represent the more dignified work of the time, but they certainly bear a close resemblance to the Chinese palaces as they are recorded for us in the screens painted by the great artists of the age. The grandeur and dignity of the Fujiwara or Kyoto style has given place to a lightness and grace that is very charming. Originally one of these pleasure pavilions was to be entirely overed with gold leaf, the other with silver, and in this gorgeous innovation we find the first indication of the tendency that was to reach its climax under the Tokugawa.

With the end of the sixteenth century came the fall of the Ashikaga, the revolt and triumph of the barons under the adventurer Hideyoshi, and the almost simultaneous founding of the Tokugawa dynasty by Iyeasu, the establishment of the most perfect feudal system the world has ever known, the transferring of the capital of the Shoguns to Yeddo, and the closing of Japan to the outer world. This tremendous revolution was accomplished within a period of thirty-five years, the overthrow of the Ashikaga marking the beginning, the closing of the ports the consummation of the revolution that cut Japan off from the world and held her so for two hundred and twenty-five years. The whole period was one of industrial development and domestic civilisation.

The Tokugawa feudalism was one of the most elaborate and perfect of which we have record, and under it government was, on the whole, well administered. One fatal error was made by the founders of the dynasty, otherwise so notably judicious and far-seeing. There must be no rival power in the State, and therefore not only was Christianity, at the time numbering hundreds of thousands of converts, utterly destroyed, but Buddhism was violently antagonised, and in its place a revival of Confucianism attempted, an empty system of ethics unvitalised by any religious element. The attempt was successful in a measure, and ultimately led to the blunder of revised Shinto, while Buddhism, out of favour with the nobility and the knighthood, fell back upon the support of the peasantry, with the inevitable results.

As a consequence of this sequence of events, architecture, cut off from Chinese influence, and answering to the demands of the new society with all its ostentatious magnificence, burst into a riot of unparalleled decoration. The development of the industrial arts made possible a degree of splendour hitherto inconceivable, and for the future (*i.e.* until the opening of the ports sounded the death knell of the civilisation of Japan) architecture was to be merged in decoration, losing little by little its original qualities as a system of constructive design.

One curious reaction took place in the shape of a third recrudescence of the Chinese type just at the time of the closing of Japan. Obaku-san, near Uji, already referred to, is the great monument of the classical style, and it came as a protest against the almost barbaric richness of the work of Hideyoshi's time. Complete as it is in plan, and imposing in design, it is yet weak and inferior in detail, and shows very clearly how self-conscious and affected an imitation it was of the Chinese type.

This last flicker of classical influence was purely sporadic, and quite impotent to stop the triumphant progress of the luxurious style already formulating itself at Nikko in the shrine of Iyeasu.

In the presence of this bewildering piece of reckless ornamentation one is apt to be blinded by its extravagance to the actual shortcomings of its architecture; but once strip it of its carving, its lacquer, its gold leaf and polychromatic decoration, and compare it in detail with the work of the Korean period, or even of the Fujiwara and Ashikaga, and it is easy to see how great has been the fall: the roofs are heavy and often coarse in their curves, the roof ridges and ribs have become enormous, crude and meaningless, the bracketing is fantastic and irrational in its intricacy and has lost the last structural excuse. Above all, the following of the lines, the curve composition, is no longer inevitably good. In the work of the Nara and Kyoto period one may view a building from any point, and by some magical power the architect has so composed his curves that there is not a discord, a lack of rhythm anywhere. Under the Tokugawa this is no longer true, and one is constantly shocked at some violent discord in the composition of line.

It is quite true that many of the temples of this period, like the Higashi Honwanji at Nagoya, are tremendously imposing —more so in size and general effect than any of the earlier structures—and occasionally there is almost no fault to be found with the composition or its curves, but too often size is the only reason for admiration.

Leave out the question of pure architecture and the Nikko shrines, together with those of Shiba and Uyeno in Tokyo, are marvels of exquisite art. The decoration is masterly, the dramatic and pictorial effect triumphant, but it is the triumph of prodigal decoration, not of architectural achievement.

Throughout Japan the majority of temples that now exis date from this period of the Tokugawa Shogunate. None o them approaches the gorgeousness of Nikko, Shiba and Uyeno but many are vastly greater and more dignified. In all of them however, one can trace the progressive coarsening of detai and loss of sense of perfect curvature, until they reach the fina point of degradation in the contemporary Shinto shrine Shokonsha and the main temple or the monastery of Zojoji both in Tokyo. Internally the Tokugawa temples are les susceptible of adverse criticism, many of them, like Chion-ji and Nishi Hongwanji in Kyoto, being models of religiou grandeur and solemn splendour. In this respect, as example of interior decoration, the Nikko shrines and those at Shib may be placed beyond criticism. Every period in Japan ha had its fitting artistic expression, sculpture, architecture, re ligious, historic and genre painting and decoration, and the las is the true manifestation of the Tokugawa régime.

Of the secular architecture of this period we have man existing examples, all, as was to be expected, characteristic o the dominant feudalism. The great castles at Himeiji, Kuma mato, Nagoya and Hikone are magnificent representations o the feudal establishments of the daimyos, and it is most regre table that their palaces in Tokyo, where they were compelle to live a portion of the year, have been destroyed, nothin remaining but the great gates and surrounding barracks. Th arrangement of these "yashiki" varied but little: a hollo square, often very large, was formed by the barracks for th daimyo's retainers; these barracks were usually two storey in height, surmounted by low-pitched roofs of tiles with th heavy ridges and angle rolls with their clumsy terminals s characteristic of the last stages of Japanese architecture; th walls were covered with black or blue-grey tiles, about 18 inche square, set diagonally, the joints being protected by great rol of cement. In the centre of the principal façade was the gre gate, used only by the daimyo or by guests of equal statio these gates were the most elaborate and stately portions of th entire group of buildings, and are of two types: the first single line of gigantic columns of wood, square and cappe and bound with bronze or iron supporting a massive system huge beams that bore the tiled roof. On either side we porter's lodges and rooms for the guard, usually very rich design and forming a part of the whole composition. T second type was one which took the place of that alrea described in case it should have been destroyed by fire, f because of some superstition or prejudice, the original ga could never be restored on the same lines. These substitu gates still retained the flanking guard-houses, but the main ro was omitted, and the enormous posts with the equally massi cross-bar acted no longer as supports, except for the pondero gates studded with big bronze bolt-heads.

Inside the quadrangle of barracks came a second for t accommodation of the domestic officials of the household, a finally in the centre of all was the daimyo's yashiki, a pla one-storey building, huge in extent, but very simple. A for of square wooden columns arranged on a unit of 6 feet form the frame of the structure, and sliding screens of rice-paper solid "fusuma," gorgeously painted and gilded, filled in t spaces between the posts, forming rooms of various sizes. certain specified places the walls were of solid plaster, but t was unusual except around the place of honour, where were t two alcoves called tokonoma and chigai-dana in the ch rooms. Around the greater part of the house was a narr gallery, called the yen-gawa, which by its projecting roof serv to protect the rice-paper screens, or shoji, that formed the ou walls of the house. The principal rooms, jo-dan and ge-d were often of great size; the former was raised a step abo the latter, and at the end were the tokonoma and chigai-da where the picture for the day and a choice selection fr the art treasures of the daimyo were exposed. On one side the upper room where the lord sat on state occasions were t doors of the most gorgeous workmanship, through which daimyo came from his anteroom. Around these two roo ran the iri-kawa, or corridor, from 6 to 9 feet wide, forming fact a portion of the state apartments, though of less hon than the jo-dan.

In the Japanese house there is no distinction betw parlour, dining-room and bedroom, so a repetition of the gr of rooms already described, together with reception-ro kitchens, baths and rooms for the taking of tea, made up entire yashiki.

In the royal palaces the decoration was often splen beyond description, gold, black lacquer, carved wood, co and coffered ceilings and splendid wall-paintings making u whole of extraordinary richness; but in the palace of daimyo much greater simplicity was the rule, and the wood usually left with a natural satiny surface, while the ceil were of plain boards of delicately grained wood, the w effect being one of great simplicity, reserve and refinement.

In the country castles of the nobles there was a still gre degree of simplicity, the daimyo usually having near by a n domestic dwelling on the lines of the Tokyo yashiki, the ca

ng principally for refuge in case of attack. Many of the tles still remain in an almost complete condition, Himeiji particular being a most noble structure. If the site were el vast walls of stone curved upward from a wide moat, wned by tiled and plastered parapets. Extensive barracks od within, and in the midst rose the great keep, three or five reys in height, each storey somewhat smaller than the one ow, the roofs curving outward in noble lines. These keeps e built of enormous timbers, the walls being filled in eral feet thick with wattles and clay and covered outside h fine white plaster. Sometimes they were plain and graceful like Nagoya, but often they were wonderfully posing, and withal graceful, like Himeiji, or better still kone.

I have dwelt at length on the arrangement of the yashiki, with allowances for the difference in station of the retro- ctive owners, it is practically a type of the contemporary mestic architecture of Japan. The system of construction is same and the arrangement of the rooms very similar, ept that the state corridor is often absent and the jo-dan ge-dan have become modest apartments of eight or ten ts in size, and serve as parlour, bedroom and dining-room the case may demand.

It must be evident that where construction is entirely of od conflagrations must be pretty certain, and such is the e, a fire that does not destroy a thousand houses hardly ng considered worthy of chronicling in the daily paper. For protection of valuables, therefore, a separate and fireproof ilding is imperative, and every house of any pretension pos- ses its "kura," or store-house, built of wood and bamboo, t covered 2 feet thick with clay that effectually resists a nflagration of any degree of fierceness. After a big fire in a panese city, nothing is left but fine ashes and the scorched t reliable kura.

We have now reached the present day, and only a word is cessary as to the architecture under the new régime of west- nism and "progress." Domestic work is still almost wholly the old lines so far as the middle classes are concerned; e nobles are building palaces from western designs that uld dishonour a trans-Mississippi city or a German suburb. e public buildings designed by local "foreign" architects e even worse, and the least offensive examples of western les are the work of natives, the Nippon Ginko and the ikoku hotel being fairly creditable examples of German assic. Occasionally important temples are built in the native yle, conscientiously and with fine results in the case of the eat Higashi Hongwanji temples in Kyoto, but usually of the stard Shinto that marks the Tokyo Shokonsha.

So far as one can see the period of good architecture is over Japan. The native attack on Buddhism two centuries ago as the beginning of the end; the restoration of Shinto was its ntinuation, and the acceptance of western civilisation was its nsummation. For thirteen centuries it has developed as vilisation progressed, each period perfecting some special ality, until it reached its climax of splendour under the first the Tokugawa Shoguns. It is now a dead style, a thing of e past, and with all other manifestations of art in Japan must r ever remain so unless some utterly unforeseen revolution ings back the great ideals and wholesome principles of the st.

We have now considered the historical development of panese architecture from its beginning in the sixth century to s apparent extinction in the last years of the nineteenth entury. Examined so it is seen to follow the lines of all other rchitectural history, expressing very accurately the changing nditions of civilisation. Like other architectural styles it is a nsistent, logical development from the conditions that brought into existence, and it demands and should receive the same spect and study that are devoted to the styles of the West. t is true that, so aloof is it from western ideals and methods f thought, it can never serve so completely as a model for ontemporary work as those styles of Europe with which we n America have such close kinship and sympathy.

On the other hand it is possible for us to learn many most aluable lessons from it. In the first place we shall see how elicately buildings of all kinds may be made to fit themselves o their surroundings. In this respect the architect of Japan cknowledges no superior. Nothing could be more subtle and ympathetic than the relationship between the temples, pagodas nd cottages in this country and their natural surroundings. n every line and mass the harmony is complete. The build- ngs seem to be almost a concentration and perfection of the ills and trees of which they seem to be a part. One feels this particularly when looking on any structure designed on western lines in Japan, no matter how excellent it may be according to European standards. The native work is a part of the country. The foreign work is ugly, ungrammatical, offensive.

Another quality that is most salient is the exceeding unity and perfection of composition either of single temples or of whole groups, either of the exterior or the interior. The whole thing is built up with the utmost refinement of feeling and delicacy of appreciation until it forms a consistent and united whole. The refinements of proportion and line have their equal only in the architecture of Greece. The measurement of some one of the older buildings reveals a subtlety of feeling for proportion that is amazing. Such measurements show at once that every curve and every line has been studied out with the most astonishing care.

Still another quality that could be studied to advantage is that of the extreme solemnity of the temple interiors. For impressiveness and deeply religious feeling, together with extreme splendour of colouring and wealth of detail, they are to be compared only with such Christian churches as St. Mark's, in Venice, or the Capella Palatina, in Palermo. Of course the Gothic interiors of Europe have their own quality of awe-inspiring majesty which no other architecture has ever approached, but for effects of dusky splendour Byzantine and Japanese architecture stand together.

It is when we come to the domestic work of Japan, however, that we find more in the way of salutary teaching. Of course the Japanese private house in plan and construction is utterly foreign to western conditions and requirements. Indeed, were it not for the amazing hardiness and indifference to cold which characterises the Japanese people, it would hardly do even for Japan, for it is probably a development from southern types. For a tropical climate it is beyond criticism, but in the cold winters of northern Japan it leaves much to be desired. It has certain qualities, however, that we could imitate to advantage. One of these is the perfect simplicity of each room, with its soft mats, its beautiful wood, its subtle colouring, its reserved and satisfying decoration. A Japanese room is full of repose, and after one has come to feel these qualities fully, one remembers with a kind of horror the stuffy chaos of the apartments in a modern western dwelling.

Perhaps more than anything else one learns in Japan the beauty of natural wood, and the right method of treating it. The universal custom of the West has been to look on wood as a convenient medium for the obtaining of ornamental forms through carving and joinery. The quality of the wood itself is seldom considered. In Japan the reverse is the case. In domestic work a Japanese builder shrinks from anything that would draw attention from the beauty of his varied woods. He treats them as we do precious marbles, and one is forced to confess that under this treatment wood is found to be quite as wonderful in material as our expensive and hardly-worked marble. In Japan one comes to the final conclusion that stains, paint and varnish, so far as interior work is concerned, are nothing short of artistic crimes.

In another respect Japanese builders are right and we are wrong. They do not destroy the sense of protection every room should have by filling whole sides of an apartment with plate glass. Instead their windows are of delicate lattice-work covered with translucent paper, and the result is a light that is soft and pleasant. Nothing can be more absurd than the western fashion of filling an entire window opening with one or two sheets of glass, particularly when, as happens in cities, there is no reason for looking out of doors.

There are many minor lessons of similar nature which we should not scorn to learn from the East, and these lessons it is perfectly possible to take to heart and act in accordance with, without copying the qualities which are expressive of a civilisation radically different to ours. Such copying would be affectation, but the profiting by the lessons offered us would be simple common sense.

FISHMONGERS' HALL.

IN the course of last year the Court of the Fishmongers' Company decided to redecorate their great hall, with the entrance and main staircase leading to it. Mr. Crace was invited to assist the company's surveyor, Mr. H. Chatfeild Clarke, in reporting upon the treatment desirable, and their joint report was adopted by the Court. The works decided upon were carried out during the autumn and completed before Christmas. The previously existing decorations were executed thirty years ago under the direction of Owen Jones, and some of the work then done remains in the reception-rooms adjoining the hall.

The building itself was erected in 1831 from the designs of H. Roberts, and is in the rather cold "Greek" character affected at that time. The late Sir Gilbert Scott, who was articled to Mr. Roberts, took some part in supervising the erection. It was an instruction of the Court to Mr. Chatfeild Clarke and Mr. Crace that the architectural detail and character should in no wise be disturbed. This has been strictly adhered to; but a much warmer and more "hospitable" result than before has been attained by the colouring, of which the following is a brief description:—

The square entrance hall, which has a flat-coffered ceiling divided by flat beams, and walls divided by pilasters, has th wall spaces of a lively Pompeiian red, the pilasters, frieze, an

cornice being of a vellum tint, relieved in the frieze by a moderate amount of ornament executed in dull yellow and chocolate-brown. The pavement here, as also in the adjoining staircase corridor, is of marble mosaic, laid out on a simple geometric scheme in mixed shades of white with bands of black, light red, grey, and yellow.

The corridor in question, and the lower storey of the grand staircase, to which it is open on one side, have also red as the ground-colour of the walls; at the top a frieze is painted in light ornament upon the red ground, interrupted at intervals by panels or medallions with dark grounds. Below a dado of simple Pompeiian character is worked on a darker tone of red. The large piers at intervals are in light colour, with bronze and gold enrichments, and the ceiling is vellum-white, with grey-blue panels, and some relief of bronze and gold in the mouldings. The doors and other woodwork here and throughout are of oak—once French-polished, but now bared of polish—brought to a natural surface of quiet tone and wax-rubbed, the mouldings being gilt.

In the grand staircase the red is continued up to the gilt string-course on the first-floor level, the niche in which Walworth's statue is placed being gilt, as also are the metal balustrades throughout. Above this level the walls are panelled, as well as being broken by scagliola pilasters and columns, by doorways, and by the large triple window. In the panels are full-length portraits, the panels and margins being in two low tones of green, divided by mouldings in gold and vellum. The ceiling here is also coffered in square panels, now in quiet light blue with gilt centre flowers; and the enrichments of the cross-beams, mouldings, &c., as also of the cornice and architrave, are mainly in bronze and gold. There is a rich maroon ground in the frieze, intended for inscription. The triple window of three equal lights (originally filled with ground glass and coloured margins) is now glazed with leaded glass, of which the design is expressive of the sea fisheries, the general ground being white, ornamented with sea plants, fish, and festoons of nets, while the borders are formed entirely of seaweeds and "crustaceans," all carefully drawn from nature. In the centre of the middle light are the Company's arms and supporters; while on either side are the arms of the former Companies of Stock-fishmongers and Salt-fishmongers, which were united in the existing Company in 1535.

The great hall, with five windows on the east front, has its ceiling, which rises on a low elliptic section, also divided into rectangular panels with bold flowers in the centre. These are divided into groups by bold bands of Greek guilloche ornaments, which have been solidly gilt with good effect, as have the centre flowers, the panels being light blue and the mass of the ceiling margins and framework in broken white. The deep cornice and frieze are in light tones, with the enrichments boldly gilt, and a dull red background to the scroll of the frieze. The scagliola pilasters remain, and the walls are painted in low-toned green as a ground for the pictures, whilst between the bronze and gold capitals of the pilasters, and close under the frieze, are ranged the interesting series of old carved and gilt shields which commemorate the arms of the Prime Wardens from early in the seventeenth century. The woodwork here, as elsewhere, is of wainscot, now freed from polish and with the mouldings gilt; and a dado of similar wainscot panelling has now been added to connect the rest. A good effect is obtained by making the walls of the music gallery of a dull red. It is to be regretted that the old inharmonious and ill-designed heraldic windows of the two end clerestory lights have been allowed to remain with the new decoration, with which they are necessarily discordant.

The hall has now been lit with electric light, partly from four points in the ceiling, where groups of lights are enclosed by pendant cut-glass drops, and partly by lights concealed by the cornice on two sides of the hall. The light is ample, and is well under control by arrangements for the partial use of any portion of the system. This lighting has been carried out by Messrs. Verity, of Regent Street. The whole of the decorative works have been carried out by Messrs. Crace, of Wigmore Street.

THE ROMAN DEFENCES OF SOUTH-EAST BRITAIN.

On last Friday evening Mr. Victor Horsley delivered a lecture at the Royal Institution on "The Roman Defences of South-East Britain." Mr. Horsley said that the many camps on the south-east coast which were mentioned in Antonine's itinerary were probably built on the sites of earlier camps, the original camp having a special interest as the work of the sailors of the British fleet of that day. Tiles had been found in the masonry stamped with the letters CL.—BR.—standing for *Classis Britannica*, and the evidence of coins pointed in the same direction. In discussing the structure of the *castra*, Mr. Horsley pointed out that the masonry was not like that found at Pompeii. The walls were constructed, not of great square blocks of stone, but with irregul masses of stone imbedded in concrete, and with bon ing courses of tiles at intervals. This structure was especial difficult to destroy. There were no remains showing wheth the walls were battlemented at the top, but this was pro ably the case. It was a curious fact that in so many the south-eastern camps of Britain one of the walls w apparently missing; but traces of the missing portion h been found in every case except, until recently, Lympne; a now, Mr. Horsley said, his excavations had enabled him trace the missing portion of that camp. After dealing wi the history of the camps and their relations to the command the neighbouring seas, Mr. Horsley pointed out how, towar the close of the Roman occupation, the raids of the Scand navian pirates became more and more determined. There wa however, nothing to settle definitely the interesting question how the last relics of Roman Empire were extinguished Britain. Some light was thrown on the point, however, by twelfth-century record of the sack of the Pevensey settlemen by the fact that the remains of Roman villas generally show traces of fire, and by an interesting discovery which had ju been made near Cardiff. Excavations there had exposed t richly tesselated floor of a Roman building, marked wi horses' hoofs and heaped with human skeletons. Thr shallow graves had been dug in the floor, and in these we found skeletons of men of a larger build—probably of t invaders. Mr. Horsley's lecture was illustrated with a lar number of very interesting limelight slides.

SUSSEX ARCHÆOLOGICAL SOCIETY.

At the first of a projected series of evening meetings of th Society, held at the Manor Hall, Old Town, Eastbourn the chairman announced that a sub-committee for excavatio of tumuli, camps, Roman remains, villas, and the like, and t foundations of ancient buildings, had been formed, and wou commence work as soon as the spring was a little mo advanced, and the secretary, whose official address was, reminded them, Lewes Castle, would be very glad to hear any sites which might require attention. He also referred interesting excavation works in connection with Michelha and Pevensey Castle.

Papers were then read by the Rev. W. Hudson on "T Hundred of Eastbourne and its Boroughs in the Thirteen Century"; Mr. W. Dent Gardner on "Some Early Suss Charters" (read by him in the absence of Mr. J. H. Rou M.A.); and one by Mr. H. Michell Whitley on "Eastbour Church: its Dedication and Guilds." The reading of t papers was followed with much attention, and at the clos most cordial vote of thanks to the compilers was pass unanimously.

Several excellent impressions of Sussex brasses, with oth drawings, were exhibited on the walls of the hall, while so old wooden platters, the property of Miss Whitley, and oth interesting objects were displayed.

LEEDS AND YORKSHIRE ARCHITECTURA SOCIETY.

A LECTURE was delivered by Mr. G. P. Bankart, Leicester, in the Society's rooms, Park Street, on t 6th inst., on "British Plaster Work, its Past and Future." T lecturer said that plaster work was an art-craft of very ancie origin. In the fifteenth century, after having apparently laps it again came into practice. Lime of the best quality w chopped up, beaten with sticks, and subjected to three cour of preparation, ending with an admixture of marble dust to the hardness and whiteness of the original stucco duro. T application of this was so far successful as to be grea favoured by the Venetians and Mantuans, from whom practice was handed on, *viâ* France, to England, wh monarch (Henry VIII.) imported workmen for the adornm of his house of "Nonsuch," now lost to sight. The Italian thus introduced into this country soon gave way to a coar style of work. In the place of figure drawing, an arrangem of panels appeared, with patterns of small area that wo repeat with ease. The Fish Room at Audley End was capital example of this Early English school. Subsequen the size of the subdivisions expanded until it became the ha to divide ceilings into quarters. This ultimately led to abandonment of the strict geometrical system. In execut the type of plaster work seen at Holyrood and other pla the design was drawn upon the ceiling, the stems and lea employed being modelled *in situ*, with the details added required. A company of gentlemen modellers was form who did much to preserve the best traditions of the art, wh about the time of the Restoration acquired a new vital

Later on the art again declined, texture was lost, and, instead of showing individual feeling, plaster craftsmen came to resemble so much machinery made for working purposes.

Mr. Bankart's lecture was illustrated by a great variety of photographs and limelight pictures that testified to an early excellence in the art of plaster work that is apparently beyond the reach of to-day.

EAST OF SCOTLAND ENGINEERING ASSOCIATION.

THE fourth sessional meeting of this Association was held on Friday night in the Bible Society's Rooms, 5 St. Andrew Square, Edinburgh—Mr. J. D. Gibson presiding—when a lecture on "Some Great Mediæval Churches and their Construction" was delivered by Mr. H. F. Kerr.

The Chairman, in introducing the lecturer, took occasion to refer to the appointment of Mr. John Young, president of the Association, as burgh surveyor for the town of Ayr, and expressed the congratulations of the Association together with their regret at losing Mr. Young.

Mr. Kerr, in the course of his lecture, said the great churches of Mediæval times had been admired both by the practical and the artistic mind. The former had room to ponder the scientific skill with which these early builders covered vast spaces with great vaults, the whole supported on a minimum of solid piers; the artist revelled in the equally marvellous manner in which every feature—and every feature was a constructional item—was treated so as to fully satisfy the imagination; the result being universal admiration and respect. The division of these churches, almost invariably cruciform in plan, into aisles covered with vaults was fully entered into; and the difficulties met with in early vaults of barrel pattern, and the solutions of these, were pointed out. The aim of the early builders was to light the nave by windows above the great arcade and beneath the stone ceiling without rendering precarious the stability of the fabric. The development to this end was traced from barrel vault, through ground vault, to rib vault and pointed vault. The construction, the features, and the decoration of these buildings were fully indicated by chronological diagrams and views. The buildings illustrated included Durham, Peterborough, Salisbury, Canterbury, and Lincoln Cathedrals, while the foreign examples embraced the St. Chapelle, Paris, and Amiens Cathedral. The latest development of vaults in England—the fan vault—was exemplified by views and diagrams of the ceiling of Henry VII.'s Chapel, Westminster Abbey, and the cloisters of Gloucester Cathedral. Altogether about eighty views and diagrams were shown by the lantern.

At the conclusion of the lecture Mr. Kerr was, on the motion of the Chairman, awarded a hearty vote of thanks.

EDINBURGH ARCHITECTURAL SOCIETY.

THE opening lecture in connection with the Edinburgh Architectural Society took place on the 3rd inst. Mr. A. Lorne Campbell, the president, occupied the chair. In the course of his opening remarks he referred to the success of several of the members of the Society in the recent competitions of the Royal Institute of British Architects, where no fewer than four awards fell to the members of the Society in open competition. These included the Pugin Scholarship to Mr. J. Hervey Rutherford, the Soane Medallion to Mr. W. A. Mellon, the Owen Jones Travelling Studentship to Mr. J. T. Stewart, and the third place in the Pugin competition to Mr. Ramsay Traquair. Mr. Forbes then delivered a lecture upon the "Abbeys in the Stewartry of Kirkcudbright," which was profusely illustrated by limelight views.

TESSERÆ.

Gresham's Royal Exchange.

THERE were walks above us as well as below; the upper part of the building being divided into no less than one hundred small shops, from the rents of which Gresham proposed, in part, to reimburse himself for his outlay in its erection. An equal number of vaults were dug beneath, adapted for the reception of merchandise; but these were found to be so dark and damp that they soon become of little value. Desirable for the display of wares as a shop must have been in a place of so much resort as the Burse, we learn from the chronicler who interested himself most in the history of the city that for two or three years after its erection the shops remained "in a manner empty." Queen Elizabeth, however, having signified her intention of visiting the founder, and in person inspecting and naming his edifice, Gresham naturally became anxious to improve its appearance, and render it fitter for the reception of his royal guest. "He went," in consequence, says Stowe, "twise in one day round about the upper pawne, and besought those few shoppe-keepers then present, that they would furnish and adorne with wares, and waxe lights, as many shops as they either could or would, and they should have all those shops so furnished rent-free that yeere; which, other wayes, at that time was forty-shillings a shoppe by the yeere. And within two yeres after, hee raysed that rent unto foure marks a yeere; and within a while after that, hee raised his rent of every shoppe unto foure pounds tenne shillings a yeere, and then all shoppes were well furnished according to that time; for then the milliners or haberdashers in that place solde mouse-trappes, bird-cages, shooing-horns, lanthorns, and Jewes-trumpes, &c. There was also at that time that kept shoppes in the upper pawne of the Royall Exchange, —armorours, that sold both olde and new armor, apothecaries, booke-sellers, goldsmiths, and glasse-sellers; although now it is as plenteously stored with all kinde of rich wares and fine commodities, as any particular place in Europe. Unto which place many forraine Princes dayly send, to be served of the best sort." It was in consequence of the season of the year at which Queen Elizabeth made her progress into the City that Gresham required the aid of illumination to set off the Burse to advantage. Stowe relates that on January 23, 1570-71, "the Queen's Majesty, attended with her nobility, came from her house at the Strande, called Somerset-House, and entered the citie by Temple-bar, through Fleete-streete, Cheap, and so by the north side of the Burse, to Sir Thomas Gresham's in Bishopsgate-streete, where she dined. After dinner, her Majestie returning through Cornhill, entered the Burse on the south side; and after that she had viewed every part thereof above the ground, especially the pawne, which was richly furnished with all sorts of the finest wares in the city, she caused the same Burse by an herralde and a trompet to be proclaimed the *Royal Exchange*, and so to be called from thenceforth, and not otherwise."

Subject and Treatment in Art.

Consummate style in every art manifests itself in knowing how to remove its specific limits without also abolishing its specific advantages, while a skilful improvement of its peculiarity bestows upon it a more universal character. And the artist must not only overcome by his treatment the limits which the specific character of his kind of art brings with it, but also those which belong to the particular material which he elaborates. In a genuine work of art the subject should effect nothing, but the form everything, since the entirety of man is acted upon by form alone, but only single powers by the subject. However noble and comprehensive, then, the subject may be, it is always confined in its influence upon the spirit, and true æsthetic freedom is to be expected only from form. Herein, then, consists the art-secret of the master, that by the form he abolishes the subject; and the more imposing, assuming, attractive the subject is in itself, the more absolutely that it intrudes its operation, or the more inclined the observer is to merge himself immediately in the subject, the more triumphant is the art which repels the former and maintains authority over the latter. The mind of the spectator and hearer must remain entirely free and inviolable; it should pass from the magic circle of the artist pure and perfect as from the hands of the Creator. The most frivolous object must be so handled that we remain disposed to pass immediately from that to one of sober earnest. The gravest subject must be so handled that we retain the capability of exchanging it immediately for the lightest sport.

Thorwaldsen and the Architects.

In his house, and as a private individual, Thorwaldsen was as amiable and estimable as in his studio. In the centre of one of the rooms was a four-sided sofa, which was embroidered expressly for him by the fair hands of the Copenhagen ladies. The walls were covered with pictures, some of them very good, others of a less degree of merit. They were not all bought on account of their excellence; Thorwaldsen purchased many of them to assist young artists who were living, poor and in difficulties, at Rome. Dressed in his blue-linen blouse, he explained to his visitor the subjects of these pictures without the slightest tinge of vanity in his manner or words. None of the dignities or honours that were showered upon him had in the slightest degree turned his head. Affable, cheerful and even-tempered, he appeared to have preserved much of the joyous light-heartedness of youth. With great glee he once related to Herr Boas the trick he had played the architects of the church of Our Lady at Copenhagen. "Architects are obstinate people," said he, "and one must know how to manage them. Thank Heaven, that is a knowledge which I possess in a tolerable degree. When the church of Our Lady was built the architects left six niches on either side of the interior, and these were to contain the twelve Apostles. In vain did I represent to them that statues were meant to be looked at on all sides, and that nobody could see through a stone wall. I

implored, I coaxed them ; it was all in vain. Then thought I to myself, 'He is best served who serves himself,' and thereupon I made the statues a good half foot higher than the niches. You should have seen the length of the architects' faces when they found this out. But they could not help themselves ; the infernal sentry-boxes were bricked up, and my Apostles stand out upon their pedestals, as you may have seen when you visited the church." Thorwaldsen was devotedly attached to Copenhagen, and made a present to the city of all his works and collections, upon condition that a fitting locality should be prepared for their reception, and that the museum should bear his name. The king gave a wing of the Christiansburg for this purpose, and the call for subscriptions was enthusiastically responded to.

The Old Châtelets of Paris.

The first bridge formed to connect the city, *par excellence* of Paris on the island of the Francs, with the Fau-Bourg, or false town, on the right bank, was guarded by a petit châtelet, or little castle, at the island, and a grand châtelet on the land side, the two fortalices famous in the town history. The larger one, serving as gateway to the bridge, stood on the river bank, near the still standing and beautiful belfry of the church of St. Jacques, and its tall, Norman circular tower and crenellated turrets must have rendered this veteran relic of early French architecture a conspicuous and vigilant sentinel. At once a fortress, a chief seat of jurisdiction, and a prison, it was the theatre of numerous tragedies ; the most bloody were the massacre in 1418 of the Armagnacs, which led to Henry V.'s invasion, and a slaughter of 216 prisoners in 1792. The prison châtelet contained chambers and cells whose names suggest horrors such as were too common in factious, warlike ages, were not wholly extinct in England until Howard descended into the hell of her dungeons, and were rife a few years ago in Naples and Sicily. Out of sixteen of these compartments ten were less dreadful than the rest, because the imprisoned could pay certain fees ; yet some of their names—"Les Chaines," "La Boucherie," "La Motte" (the turf), "La Griêche" (the shrew), and "Barbarie"—imply the miseries of their denizens, though less than those of wretched prisoners in "La Fosse," "Le Puits," "Le Gourdain" (the bludgeon), "La Fin d'Aise" (end of ease), which was full of dirt and reptiles, and "Les Oubliettes," all presenting horrible ideas to the mind. This castle was demolished in 1802, and its site is now the river side of the handsome Place du Châtelet. On the island side of the river stood the Petit Châtelet, near the site of a Roman prison, called by Gratian, who saw it, "Carcer Glaucini." This fortalice was the gate of insular Paris under St. Louis, who fixed a toll to be paid on entering the city, one of the items of which is curious, ordaining that a monkey for sale should pay four deniers toll ; but if belonging to a *joculateur*, juggler or joker, he might save the tax by making the animal dance before the toll-taker ; whence the proverb, "Payer en monnaie de singe," that is to say, in grimaces. A ballad singer was allowed to sing a *geste*, or gesticular song, instead of paying toll. The prison here was in two respects a sort of chapel of ease to that of the larger châtelet, being seldom used save when the latter was full, and being, even in the fourteenth century, airy and secure, excepting three dungeons, or *chartres-passes*, where the inmates could not live long, for want of air.

The Mosque of Cordova.

In the eighth century civil war broke out among the Moors, not only in Spain, but in Syria and elsewhere. The defeated party were seized and put to death. Among the few survivors of the general doom was a youth named Abdurrahman Ibn Muawiyah, a grandson of the Khalif Hisham. For some years he was concealed as an outlaw among the tribes of Northern Africa. Fortune however changed; he was victorious in Spain and established a new dynasty. The sciences and fine arts, which had been almost banished from Spain, returned in his train, and literature was encouraged by the example of Abdurrahman, who was himself a poet of no mean merit. His affectionate remembrance of his Syrian home led him to introduce into his new kingdom the flowers and fruits of the East, and the palm-tree, which was the parent of all those of its kind in Spain, and to which he addressed the well-known lines lamenting their common fate as exiles from their fatherland, was planted by himself in the gardens of the Rissáfah, a country palace built on the model of one near Damascus, in which the first years of his life had been spent. In architectural magnificence he rivalled or surpassed the former princes of his race, the monuments of whose grandeur still exist in the mosque of the Beni-Umeyyah at Damascus and other edifices adorning the cities of Syria. The palaces and aqueducts which he constructed in Cordova testified his zeal for the splendour, as well as his care for the salubrity of his capital, and after expending the sum of 80,000 golden dinars (the produce of the royal fifth of all spoil taken in war) in the erection of the stately mosque which bears his name, he bequeathed the completion of the structure at his death, A.D. 788, to his younger son Hisham, whom he nominated as his successor, to the exclusion of the elder brother Soliman. Al-Makkari devote an entire chapter to the wonders of this celebrated temple which was finished A.D. 794, nine years after its commence ment, and received additions from almost every successiv sovereign of the house of Umeyyah. In its present state, a the cathedral of Cordova, it still covers more ground than an church in Christendom; but the inner roof, with its elaborat carving, the mihrab, or shrine, of minute inlaid work of ivory gems and precious woods, and containing a copy of the Kora which had belonged to the Khalif Othman, the embosse plates of gold and silver which encrusted the doors, and th apples of the same metals which surmounted the dome hav long since disappeared, and the thousand (or, as some say thirteen hundred) columns of polished marble which it onc boasted have been grievously reduced in number to mak room for the shrines and chapels of Christian saints. Th unequal length and proportions of those which remain, thei irregular grouping and the want of height in the roof whic they support indicate a far lower grade of architectural tast than that which we find in the aerial palaces of Granada; bu all the Arabic writers who have described it concur in consider ing it one of the wonders of the world, and it ranked in th estimation of the Spanish Moslems as inferior in point o sanctity to none but the Kaaba and the mosque of Omar a Jerusalem.

THE HARROGATE PUMP-ROOM.

THE Assessor in the Harrogate Royal Pump-room Competi tion (Mr. George Corson, architect, Leeds) has given hi award, which is as follows, viz. : *New Building.*—1st premium 50*l.*, Mr. F. Anderson, 18 Adam Street, Adelphi, London W.C. ; 2nd premium, 30*l.*, Mr. Arthur A. Gibson, architect Harrogate ; 3rd premium, 20*l.*, Messrs. Eade & Johns, archi tects, Ipswich. *Enlargement of Present Building.*—1st pre mium, 30*l.*, Mr. F. Anderson, London ; 2nd premium, 20*l* Mr. E. Jenkin Williams, architect, Cardiff ; 3rd premium, 10*l* Messrs. Hunt & Shield, 3 New Inn, Strand, London, W.C The whole of the drawings are on view in the winter garde of the Royal Baths during this week (February 6 to 11 in clusive), from 10 A.M. to 5 P.M., and the drawings of th unsuccessful competitors will be returned afterwards.

GENERAL.

A Meeting is to be held on the 21st inst., at four o'cloc at the Midland Grand Hotel, St. Pancras, of a few friends wh are interested in the ancient and decaying buildings in an around London, with a view to discussing informally th possibilities and best methods of securing pictorial photograph records of these objects of historical interest (which are con stantly changing and disappearing) to add to the Nation Photographic Record collection at the British Museum.

M. Paul Dubois has completed the recumbent figure the Duc d'Aumale, which is to be placed on the tomb in th chapel of Dreux. The prince is represented holding his swor and with the French flag clasped to his breast. The statu may be exhibited in this year's Salon.

Mr. R. E. Tyler, architect, obtained a verdict in th Queen's Bench for 238*l.* 13*s.* against Mr. Charles Renad an Mr. Fred. Renad, being the amount of his fees for preparin plans and drawings for a theatre which defendants intended t build at Tottenham.

The Subscriptions for the memorial of Richard Wagn which is to be erected in Berlin have reached the sum require viz. 5,000*l.* The arrangements for a competition amon sculptors are nearly complete. The position of the memori has to be determined.

Mr. E. O. Sachs has been appointed technical adviser all architectural and mechanical matters to the Grand Ope Syndicate that has taken over Covent Garden Theatre.

The Leipsic Museum of Art Industry is enriched by complete salon from a house in Haarlem, which was late removed. The decorations must have been executed by ab artists in the last century. Walls and ceiling are painted the Italian style.

Sir Richard Temple presided on Saturday at a meetin to consider the advisability of securing a site for new building for the Hampstead Hospital and Nursing Institute, Parliame Hill. It was stated that the proposal was to erect ne buildings with at least fifty beds to take the place of the prese inadequate premises with thirty-two beds. The cost, with sit was variously estimated at from 10,000*l.* to 20,000*l.*

The Exhibition of Water-Colours by members of t Dudley Gallery Art Society will be opened on Monday next.

Mr. T. C. Hine, F.S.A., an architect who has had exte sive practice in the Nottingham district, has just died in h eighty-sixth year.

Mr. Dennett H. Barry, F.S.I., has been appointed by t Benchers as surveyor to the Honourable Society of Lincol Inn.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Build ings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must not necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

NEW READING CASE.

To Librarians of the Public Libraries and Reading-Rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, Imperial Buildings, Ludgate Circus, London, E.C.

For Advertisement Scale, see page xiii.

WOLVERHAMPTON.—Feb. 27.—For erection of an extension of the electric-lighting station, Commercial Road. Mr. J. W. Bradley, borough engineer, Town Hall, Wolverhampton.

BASEMENT WALLS.

ON the 2nd inst. Mr. Verey, Official Referee, tried an action which was brought by Mr. Nathaniel Fortescue, housebreaker and excavator, of Mare Street, Hackney, against Mr. William Hyam, proprietor of the White Horse public-house, Fetter Lane, City, for 72*l.*, the balance of the contract price for pulling-down and clearing the site of the old White Horse. Mr. Powell appeared for the plaintiff, and Mr. Morton Smith (instructed by Mr. H. H. Richardson) for the defendant. The principal point in the case was whether basement walls which retained the roadway were included in the description in the specification of "all walls." Mr. Fortescue set up a custom in the trade that retaining walls were never pulled down unless actually specified, and that a provision for shoring the roadway should have been included if these walls had been intended to come down. Considerable evidence was given by housebreakers on one side, and surveyors (including Messrs. Cubitt & Collinson, Mr. T. Woodbridge Biggs, and Mr. Strudwick) on the other, and in the result the Official Referee found against the alleged custom, and directed judgment to be entered for the defendant, with costs.

ioho Cowl & Ventilator
(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.
The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.
"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."
"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."
"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once.

TRADE NOTES.

THE new Infectious Diseases Hospital, Chester, which is nearing completion, is being erected from the plans and under the supervision of Mr. H. Beswick, county architect, Chester, the builder being Mr. W. W. Freeman. The whole of the wards are being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke-flues, Manchester grates, Shorland's patent exhaust roof-ventilators and inlets.

THE new offices and stables, &c., for the Urban District Council of Eastleigh are being ventilated by means of Mackay's patent invisible roof ventilator, supplied by the sole makers, Cousland & Mackay, 150 Hope Street, Glasgow.

THE parish church of Biggin, Derbyshire, has just received an addition in the shape of a tower clock, which has been erected at the cost of Mrs. Wraith in memory of her father. It has two dials facing north and south, and strikes the hours. Messrs. Smith & Sons, Midland Clock Works, Derby, carried out the work.

MR. H. MORELL, picture-frame and moulding manufacturer, of St. Andrew Street, Bloomsbury, has just completed and issued a somewhat voluminous sketch-book containing several hundreds of well-drawn and printed sketches of mouldings of every description and adapted to every purpose for which mouldings can be used.

ELECTRIC NOTES.

IT was reported at the meeting of the members of the Liverpool electric power and lighting committee on the 3rd inst. that the Local Government Board had given their sanction for a further loan of 44,000*l.* to be obtained for electric-lighting purposes in the city.

AT a special meeting of the Greenock Police Board on Tuesday the plans of the power-house prepared by Mr. Fedden, the engineer, to be erected at Hunter Place, were unanimously approved.

PREPARATIONS are being made in the vicinity of Henry the Eighth's Gate for connecting Windsor Castle with the Windsor and Eton Electric Installation Company's service, by which the principal apartments of the royal residence will in future be lighted. Iron pipes are being laid up Castle Hill for the reception of the cable, and by the 11th inst., a few days before the Queen's arrival, the new service will be ready for use.

THE Bootle scheme of electric lighting, which is an elaborate one, and will cost some 37,000*l.*, is now rapidly approaching completion. It has been designed and the carrying out of the works superintended by Mr. Thos. L. Miller M.Inst.C.E., Tower Buildings, Liverpool, the consulting engineer to the Corporation, Mr. O. F. Francis, Assoc.Inst.E.E. acting as his clerk of works; the buildings being from the plans prepared by the borough engineer, Mr. J. A. Crowther Assoc.M.Inst.C.E.

IT has been decided to erect a hospital for infectious diseases at Birstall. It is to be known as the Oakley Joint Hospital, will cost about 13,000*l.*, and will be situated at Foxhall, between Fieldhead and Geldard Road.

VARIETIES.

THREE new sub-building inspectors are to be appointed by the Leeds Corporation.

IT is proposed, says the *City Press*, to connect St. Margaret's with the South-Eastern and London & Chatham systems by a light railway running between that watering-place and Martin Mill station on the Dover and Deal Railway.

"WHITAKER'S TITLED PERSONS" is a volume of which the interest is not confined to those whose names are recorded, for it furnishes an accurate work of reference for the use of business houses, giving particulars respecting people of position, with the town and country residences, arranged in the simplest manner and produced at the lowest possible price.

THE Dominican Church of St. Sebastian, now in course of erection in the Gerald Road, Pendleton, is growing rapidly. A priory, to accommodate a larger number of fathers, will soon be built according to the designs of Messrs. Sinnott, Sinnott & Powell, the architects of the new church. The church and priory buildings will present a fine frontage to the Gerald Road.

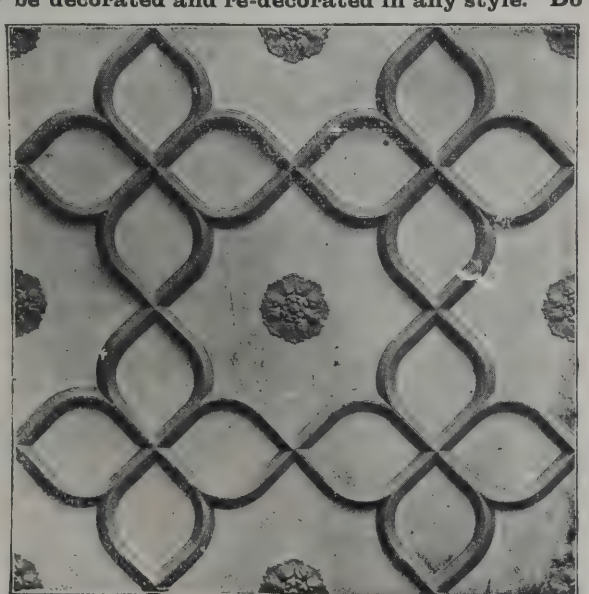
DURING some excavations for a new building at the Scotch Gate, which forms part of Berwick rampart, a number of human bones have been found. An ancient church dedicated to the Virgin Mary stood at this spot, and it was removed when the ramparts were built in the reign of Queen Elizabeth. The remains of a graveyard were found some time ago, when a water cistern was constructed about fifty yards away.

IT has been decided to open the Alexandra Palace and grounds each Sunday next summer to holders of season tickets and a limited number of their friends. Sacred music will be provided in the afternoons and evenings, and the programmes will include orchestral, military, vocal, and occasionally choral selections.

THE London County Council have given their consent to the formation of a new street, 50 feet wide and nearly a quarter of a mile long, starting close to St. Paul's Schools at West Kensington, and terminating opposite the house of the late Sir E. Burne-Jones. The street will be known as Fitzgeorge Avenue, and will be occupied on both sides of its entire length by blocks of residential flats. The contract for the whole operation is being carried out by Mr. Henry Lovatt from the designs of Mr. Delissa Joseph, F.R.I.B.A.

THE new County Club for Ladies, at 21 Hanover Square, W., promises to be a success. The situation is excellent, in the centre of the fashionable shopping world; the subscription is moderate, the comforts and conveniences offered to ladies up from the country are excellent, and the furnishing and decorations in refined taste, and such as the most luxury-loving club woman could desire, Messrs. Oetzmann & Co of Hampstead Road, N.W., having carried out everything. The dining-room and reading-room are dainty and cosy in brocaded furniture, saddle-bags, &c., with richly decorative papers; and the bedrooms are fresh and pretty in pure white furniture, with dainty papers very like old French silks in design.

THE Horton estate, Northamptonshire, formerly the seat of Sir Robert Henry Gunning, Bart., has just been sold by Messrs. Knight, Frank & Rutley, of Conduit Street, for a sum approaching 90,000*l*. The estate, which covers an area of 3,300 acres, was successively possessed by the Salisburys, Montagues, and the Earl of Halifax, the latter erecting the mansion which at present exists. To the south of the Hall is the building formerly used by Lord Halifax as a menagerie. We understand that the purchaser is Mr. G. Harold Winterbottom, of Manchester.



AN important and highly interesting demonstration took place last week outside the Town Hall, Lavender Hill, Battersea, where, in the presence of an assembly of experts and members from the London County Council, insurance companies, and various vestries, the merits and working of the combined lamp-post and fire hydrant, patented by Mr. W. Jones, were thoroughly tested and examined. The object of the invention is to remedy the defects and disadvantages apparent in the present system of hydrants. Mr. Jones's invention combines the hydrant with the lamp-post, and includes the painting of the latter a red colour, the word "fire" being written in large letters on the lamp-glass, so that the position of the hydrant is always and immediately evident. The water supply is obtainable by means of a pipe placed in the base of the lamp-post, a screw-joint being attached to it, while a valve alongside admits of the water being turned on almost instantaneously. By a syphon arrangement it is claimed that the water cannot freeze in the pipes while it is liquid in the mains. An exhibition of the *modus operandi* was afforded to the spectators, the hose being attached and a jet of water some 50 feet high being at once thrown into the air.

THE new Baptist chapel in Adnitt Road, Northampton which has been erected at a cost of 2,232*l*. 10*s*., including site, is now open It is in the Early Perpendicular style, and

ief Offices—Dock House, Billiter Street, E.C. Also at Manchester, Newcastle, Liverpool, Hull, Cardiff, Glasgow, Bristol, &c., &c.

is of red brick, with dressings of yellow Weldon stone, and the front has a vaulted porch and tracery windows and pinnacles. The interior presents a spacious yet homely appearance. The width of the chapel is divided into three spaces by an ornamental timber arcade, which gives a central body and side aisles, while the clerestory over the arcade is in half-timber work. There are clerestory windows in addition to the aisle and transept lights, and chairs are used for seating accommodation. Four hundred chairs have been placed in the church, but the spacious interior is sufficient to allow of 600 persons assembling in the building at one time The decorating, which is very tastefully carried out, is in distemper, with woodwork stained green and varnished, and the traceried windows are glazed with leaded lights. At the rear of the church is the minister's vestry and a deacons' vestry. Under the minister's vestry is the heating basement, with a boiler for tea-making or any similar purpose. A through corridor at the back of the church gives ready means of egress in case of need, and will serve as a means of communication with the Sunday schools, which are to be built on the adjoining land. Messrs. Mosley & Anderson, of Northampton, are the architects.

BUILDING AND BUILDERS.

THE erection of a new Baptist church and schools at Stockton-on-Tees is to be at once proceeded with.

A NEW Wesleyan chapel is to be erected in Darlington Street, Wolverhampton, at a cost of about 12,000*l.*

A NEW theatre is to be erected at Stoke-on-Trent in the course of the present year at a cost of 15,000*l.*

IT has been decided to erect a new Wesleyan chapel in Darlington Street, Wolverhampton, at a cost of about 12,000*l.*

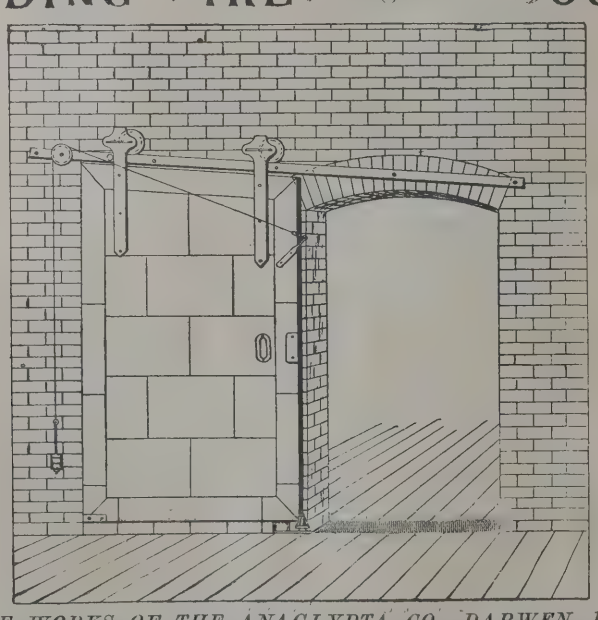
A VARIETY theatre is about to be erected at a cost of 30,000*l.* in Broadway, Trafford Road, Salford.

A NEW brickfield has been opened at Sandholme. Two kilns are to be built, each to hold 50,000 bricks. Nearly 20 acres will be developed.

A LARGE infant school is about to be erected in Eldon Road, Lower Edmonton, from plans prepared by Mr. Henry W. Dobb, architect, of 110 London Wall.

MESSRS. W. & J. BAILEY, architects, of Bradford, have received instructions to prepare plans for the extension of Thorpe School for the Idle School Board.

THE strike of Aberdeen joiners, which has lasted a week, was settled on Tuesday. The men demanded an immediate rise of a halfpenny per hour, and the masters have agreed to give a farthing increase in April and another farthing five months afterwards. The men, numbering 650, have resumed work.



THE Dunoon School Board have passed the plans prepared by Mr. Fraser, architect, for the extension of the Dunoon Grammar School, at an outlay of between 3,000*l.* and 4,000*l.*, which is to be spent in erecting an additional storey over the central part of the school.

THE scheme to extend the Leith Hospital in commemoration of the Queen's Diamond Jubilee is likely to take practical shape in the course of a few months, the directors of the hospital having now matured plans to meet the views of the commemoration scheme committee.

AT a meeting on Tuesday of the Liverpool Select Vestry the special sub-committee on the hospital question reported that plans for the proposed new hospital at Highfield were now in their possession, and the estimated total cost of the building and equipment was 105,353*l.* The cost of the land was 10,000*l.*

A SHOCKING scaffolding accident, resulting in two deaths, occurred on Tuesday afternoon in the Lawnmarket, Edinburgh. Three slaters were engaged in repairing a chimney head when the scaffolding slipped. Two of the men were precipitated into the court 60 or 70 feet below, one being killed outright, while the second died while being conveyed to the infirmary. The third man had a marvellous escape, falling on to a ledge a few feet below the scaffolding, and sustaining only slight injuries

A NEW Palace of Varieties is to be erected on the site of the existing Theatre Royal, Kilburn, and the adjoining properties, which will form a magnificent corner block. The building, which will accommodate 1,500, will be without column, and an uninterrupted view of the stage will be given from all parts of the auditorium. The style adopted by the architects, Messrs. Palgrave & Co., Victoria Street, S.W., is a free rendering of French Renaissance, while the exterior principal front will be in glazed terra cotta faience work, by Burmantofts, Limited. The estimated cost is about 30,000*l.*, apart from the various properties to be acquired. It is expected the new building will be ready for opening in the late autumn. Messrs. Wylson & Long are acting as consulting architects.

The metal sheets have expanded without becoming detached, whilst the wood is simply charred to a depth of about ⅛ of an inch.
FULL PARTICULARS AND ESTIMATES FREE.

OPERATIONS are at once to be commenced for the erection of a new lighthouse at Barn Ness, on the Haddingtonshire coast, near Innerwick, a spot which has been the scene of wrecks for many years. The lighthouse is to be 100 feet high. The light will be a group showing three flashes in quick succession every half-minute, the beam of light of each of the flashes being 70,000 candle-power. It is also proposed at an early date to erect a lighthouse on the Bass Rock.

THE Mersey Docks and Harbour Board had before them last week a recommendation by the works committee involving the expenditure of nearly one million sterling. Some time ago a general scheme for improving and extending the dock system of the port was agreed to, the total estimated expenditure being close on four millions, and Parliamentary powers having been obtained, it is now proposed to proceed with the first instalment of the work. That was the recommendation which the committee brought forward, and it was stated that this portion of the scheme, which includes, among other things the construction of two large new graving docks, would probably cost 885,335*l*. After some discussion as to details, the committee's recommendation was allowed to stand over for a fortnight, in order to comply with standing orders.

AN accident, by which seven men were injured, occurred at Christ Church, Birmingham, on Tuesday. The church, which is situated in the heart of the city, is one of the oldest, and at the present time is being demolished under the Church Extension scheme. It had been closed because it was no longer required in its present position, the resident population having moved from around it. A new church is being erected in the suburbs in its place. For some days crowds of people have watched the operations of the steeple-jacks in taking down the spire, and this work of demolition was proceeding when the accident took place. A number of men were engaged upon the roof of the building when one of the large beams running into the turret from which the spire springs suddenly gave way. The men fell a distance of upwards of 30 feet. Besides those on the roof other men were at work inside the building, but most of them luckily escaped. For a time the greatest excitement prevailed, and it was feared that several men were buried beneath the débris. They were all, however, accounted for, but it was found that no fewer than seven of them had been rather seriously injured. They were all taken to the General Hospital and detained. Several others were treated for minor injuries.

IMPROVED PLUMBING.

A DEBATE was opened by Dr. Mansel-Howe on Friday last at King's College on "The Testing of the House-drain and Stack-pipes, their Cleansing and Disinfection after Illness," in connection with the classes of instruction for plumbers and sanitary inspectors conducted at the college. There was a large attendance of plumbers. The opener showed by lantern illustrations some of the ordinary means adopted by plumbers for examining the reliability of pipes, viz. the water test, the smoke test, and the various odour tests. He also illustrated and considered the testing of pipes by compressed air and the use of the mercury gauge, and of rarefaction of the air in conjunction with the vacuum gauge, pointing out for these tests greater simplicity, efficiency, and the lesser liability of damage to property than by the use of the water test.

The cleansing of the house-drain and shaft-pipes was advocated as a wise and sanitary operation to be followed from time to time independent of sickness, but after many illnesses should be compulsorily insisted on by the public sanitary authorities. At the present time, when so many house-drains were provided with inspection, ventilating and disconnecting chambers, it was comparatively easy to thoroughly brush out and scour this channel. And in like manner the fittings and traps in association with the stack-pipes were provided in all better-class plumbing work with inspection and cleaning eyes, in order that the curves and bends of the pipes in these fittings might be cleansed.

Unfortunately these inspection eyes were rarely employed for cleansing purposes pure and simple, and only made use of when some temporary stoppage or lodgment in the pipes necessitated immediate attention.

When, however, the house-drain and stack-pipes had been treated mechanically by means of brushes, &c., it was recommended that all those pipes should be subjected to the disinfecting properties of chlorine gas, for the destruction of all pathogenic germs that were lingering in the inaccessible parts of the pipes, and in the meshes of the hemp too frequently found in the many unions of the house drain-pipe.

The opener of the debate stated he was greatly indebted to Mr. Edmund White, B Sc., of St. Thomas's Hospital, for valuable information respecting the disinfection of the stack-pipes, and for the use and recommendation of chlorine gas in this particular.

In the discussion and debate which followed, and which was attended by some 300 plumbers, the opinion was freely

expressed that hemp might be very readily dispensed with in the uniting of iron drain-pipes, and that when the house-drain was constructed of stoneware pipes hemp should never be employed.

Professor George Aitchison, in speaking on "Utility and Art in Plumbers' Work," said :—

The Plumbers' Company has done a most excellent work in having those plumbers that are masters of their business certificated, and I may say that there is a great dearth of them, and when I ask builders why they have not a certificated plumber they say it is impossible to get one.

The principal thing we require is to have men who can be trusted to wipe joints so that they are air-tight, and make other junctions air-tight too. By this means we have prevented a great many of the diseases that faulty pipes and junctions cause, and have besides improved the health of those persons who would otherwise have their health lowered by the exhalations from faulty pipes ; and besides these advantages the men have learned to execute ordinary plumbers' work much better. We cannot be too careful of our health, for without that life becomes a burden, but at the same time we must consider that "man does not live by bread alone." Nature spreads out before us all the beauties of the sky, the earth, and the oceans for man's instruction, delight, and solace, and the plumbers were of yore as skilful in embodying the beauties of nature they had admired as the other craftsmen in the building trades ; in fact, when I was a boy the plumbers' shop window was one of my greatest delights, for in it were beautifully ornamented cisterns, lead vases, lead statues, and ornamental lead plaques for dates and inscriptions, not to speak of the quaint, if not beautiful, rain-water pipes and heads. All this has departed, and certainly every architect and every person of taste is anxious to see it revived. Some of the walks in Hampton Court gardens are still adorned with leaden statues and leaden vases, and when I was a boy the gardens of the great merchants in the City were adorned in the same manner, and very often with lead fountains too. In the Middle Ages and in the early Renaissance considerable portions of buildings then erected were ornamented with leaden crestings on the roof ; there were lead tops to pinnacles and lead sockets to weathercocks, and the leadwork to the lights was made in beautiful or curious patterns. I don't know why all these charming applications of design should be utterly laid aside and forgotten for more utilitarian objects.

The exercise of the artistic part of the craft must surely give more pleasure and pride to the craftsman than the mere wiping of a joint, or the beating out of a cesspool, however well done, besides the interest and pleasure that it causes to the public.

I hope the Company, while still continuing to instruct the workman in that which regards our health and convenience, may also add to his cultivation and interest in his work by showing him that he has not yet mastered the whole of the craft when he can execute properly the mere utilitarian parts of his trade.

Ornamental plumbing is not entirely disused, as there is a beautiful leaded lantern on one of the churches at Brighton designed, I think, by Mr. Bodley.

WIDTH OF STREETS IN FOREIGN CITIES.

VARIOUS officials having contributed information about the means of communication in foreign cities to the Society of Arts, the following abstract has been prepared concerning the width of streets :—

Berlin.—Unter den Linden (includes a broad walk with two rows of trees for nearly half of the whole length), 196 feet ; Leipziger Strasse, 72 feet ; Friedrich Strasse, 72 feet ; Friedrich Strasse, from the corner of Behren Strasse to Unter den Linden, 41 feet ; König Strasse, 57 feet. The width of the pavements on both sides of the street is included.

Brussels.—Le Boulevard Circulaire, between les Places de Namur and Louise, 220 feet ; L'Avenue Louise, 183 feet ; L'Avenue du Midi, 118 feet ; Le Boulevard Anspach, 91 feet ; Le Boulevard du Nord, 78 feet ; Le Rue de la Nord, 65 feet ; Le Rue Royale, 65 feet.

Paris.—Rue de Rivoli, 88 feet ; Rue Montmartre, 72 feet ; Avenue de l'Opéra (Boulevard St. Germain), 98 feet ; Grands Boulevards, 114 feet ; Avenue des Champs Elysées, 229 feet ; Avenue de Grande Armée, 295 feet ; Avenue Bois de Boulogne, 393 feet.

Vienna.—Ringstrasse, 187 feet ; Kärntnerstrasse (Upper), 62 feet ; Kärntnerstrasse (Lower), 121 feet ; Praterstrasse, 118 feet ; Rennwegg, 65 feet ; Hauptstrasse, third and fourth districts, 65 feet each ; Hauptstrasse, fifth district, 72 feet.

New York.—The streets vary in width from about 60 feet to 150 feet. The ordinary residence streets—beginning at First Street, and extending across the island of Manhattan from east to west, up as far as 220th Street—are 60 feet wide, excepting

COLUMBIAN MARBLES.

ONE of the most important collections of marbles in the world may be seen in Chicago. In respect to the size and perfection of the specimens no collection equals it either in America or Europe. The specimens in the most important European collection, that of the Vienna Museum, are much smaller and therefore do not give as good an idea of each variety. The marble collections of the Field Columbian Museum are installed in the "Marble Room," a hall 40 feet square lighted from above. Here about 350 polished marble slabs, mostly of the uniform size of 9 by 16 inches, are displayed in pyramidal form in eight wall cases and two upright centre cases. A minor collection of 150 smaller polished slabs, varying in size from 3 by 4 to 6 inches, is installed with the lithological collections of the adjoining room. Many of these small specimens, however, are duplicates of the marbles in the main collection.

The collection is divided into (*a*) marbles proper, (*b*) travertines (onyx marbles), (*c*) serpentines, and (*d*) eruptive rocks used for decoration. The marbles are arranged geographically. Under the geographical divisions they are so placed as to produce the most harmonious effect. All the specimens are labelled with the locations of the quarries, the trade names of the varieties, and the lithological names where the specimens are other than ordinary marble. This collection has been built up by purchase, by gifts from quarry owners, and by cutting and polishing slabs from marbles received at the close of the World's Fair.

The marbles of France, which occupy one of the centre cases, are easily pre-eminent in variety and beauty. The Henriettas and the Notre Dame are examples of the many browns and grays, all delicate in colour and same in constitution.

The brocatelles furnish yellows; the Rouge Antique and the griottes, red; the campans, with their delicate veinings, green; and the St. Amandes, black. These and intermediate colours occur in many patterns, each with its proper name. These marbles have a richness and softness which are unequalled in the rest of the collection. The judgment of the French quarrymen in selecting euphonious names for their marbles is to be commended.

The Italian marbles in the wall case opposite include a number of attractive forms, such as the black and gold Portor, so well known from the successful imitations made of it in marbelised slate and the white and violet brecciated paonazetto. The marbles of Greece and Norway, which occupy a prominent position in one of the centre cases, offer strong contrasts. The Norwegian resemble in many respects Georgia marbles. They are costly crystalline and vary in colour from white to salmon and steel grey, with some green. Besides the distribution of the colours in cloudings and indistinct bandings like those of the Georgia marbles, a common marking is what may be described as a partially obliterated breccia. Owing to the coarse crystals they have a characteristic sparkle and brilliancy.

The Greek marbles are fine-grained and the colours are softer. Among them may be noted a very good black, a number of dove marbles, a number of striking reddish-brown breccias, and a soft brown with a unique wavy design.

The well-known ivory Numidian and some Egyptian marbles represent Africa, and Asia is represented by a white and grey marble from Hong Kong. From Japan come the Ishi-no-tam or balls of stone. These are polished spheres of a breccia marble of Carboniferous age found in Kishni or the Province of Kii, where the art of making these balls has been practised for centuries. In general effect this breccia resembles the best Devon marble.

The marbles of Great Britain are of many varieties, from the white, translucent alabaster of Devon to the black Madrepore marble of Antrim, Ireland. This Madrepore marble has a black background, upon which the coralline form of the

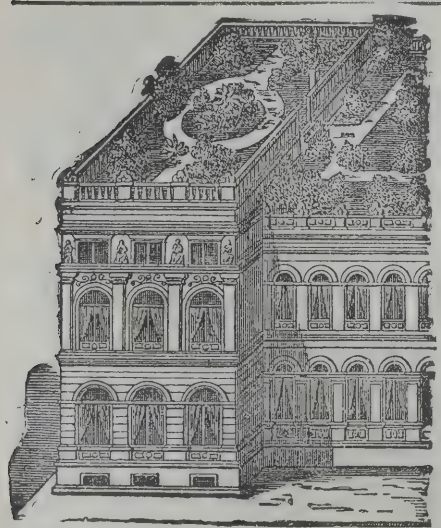
THE LARGEST MANUFACTURERS OF WOOD CHIMNEY-PIECES IN THE KINGDOM.
ESTABLISHED OVER 20 YEARS.

Madrepore is marked in pure white. The rosewood marble of Devon, the colour of rosewood and with markings closely simulating the grain of wood, is a curiosity among marbles. The encrinal marble, really a porous limestone made up of countless crinoid stems, is made to serve as a marble by means of a waxy filling which takes a somewhat resinous polish. Among the most pleasing marbles in the collection are twelve varieties of Ogwell, Ashburton, and Pettitor marbles from Devon. The colours are soft and rich, and run from a dark rich maroon through brownish-red to pearl-grey. The pattern may, perhaps, be described as being usually a mottling.

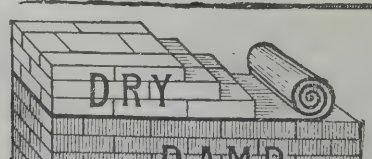
Among the American marbles the Winooski dolomites of Swanton, Vermont, are conspicuous with their peculiar patterns in dark red and white. In some varieties the colour changes to a very attractive violet-grey. With but little change in colour the pattern varies enough to give nine named varieties. The well-known Vermont marbles are represented by a very complete series of some fifteen specimens. The coarsely crystalline brilliant white, grey and salmon Georgia marbles find their place beside the Vermont specimens. Outside of the Vermont and Georgia stones the collection is very weak in American marbles. The Tennessee and other well-known stones are practically not represented. Practically the only coloured breccia to compare favourably with foreign specimens is that of the Point of Pines, Maryland, not now quarried.

The onyx marbles owing to their nature are represented by slabs of varying size, some larger, some smaller than standard. Cylindrical and curious fruit-like forms of Mexican origin give the effect of the onyx banding on curved surfaces. Besides the ordinary "Mexican onyx" from Mexico, Lower California and Arizona, less well-known localities, such as the new stalagmite marble quarries of Utah, are represented. Among other foreign localities Egypt and Syria are represented by travertines of great beauty, the same known as alabaster in Biblical times.

All the serpentines with a pronounced green body colour have been labelled, in accord with the recognised tendency of the times, Verde Antique, although many are far removed from the true Verde Antique in colour. It is evident that they form a distinct class of decorative stone which needs a name, and, moreover, that they are going to be called Verde Antique anyway. They vary from the deep velvety and slightly mottled green of the true Verde Antique from Greece to the yellow-green, strongly varied colours of the Los Angeles serpentine. With the Verde Antique, but not included among them, are displayed the speckled green and white ophite of New York, the green and white Connemara of Ireland, and the curious onion-like Cipollino of Saxony. Certain red and other serpentines displayed here are utilised more for small ornamental forms and turned objects than for architectural purposes. These include a deep green from Santa Catalina Island; a dark green, almost black, from Zoblitz, Saxony; and the well-known mottled red of Lizard Point, Cornwall.



Certain of the eruptive rocks are used for decoration. Of interest among these are the porphyries of ancient Rome and a dark green diabase porphyrite of ancient Egypt. One of the most beautiful of such stones is the garnet rock of Xalostoc, Mexico. There is much among this material which equals the best of marble in beauty, while such stones, of course, far excel it in durability. But the excessive cost of working prevents their general use.



MUNICIPAL TRADING.*

A SYSTEM of bureaucracy tends not to progress, but to stagnation; to the fixing, that is, of ideas at their existing level of development. It may be able to carry on a simple trade such as the supply of water, a commodity of universal necessity, which, therefore, needs no pushing, cannot ever be replaced by the advancement of science, and can be managed on a system of strict routine; but in any branch of industry which is of a mobile character, and which depends on the education of the public, and the tempting of customers, the private capitalist who understands his own business, and is free to conduct it in his own way without having to reckon with the opinion of a host of other people who know nothing about it, must have an incalculable advantage. To attempt to pre-surmise how this stagnating tendency inherent in municipal enterprise will operate must necessarily be to some extent speculative, and, for sheer lack of imagination, must fall short of the realisation. One probable effect may be noticed; our municipalities, naturally on account of their democratic basis, and very properly on all occasions, take a great interest in the welfare of the working classes. They consider they best conduce to this welfare by supporting the regulations of the trade unions. There can be no doubt that these bodies have been of great service in

PATENT
VULCANITE ROOFING

Since the introduction of the patent Vulcanite Roofing into this country it has been adopt by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospita Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summ than under any other roof. When properly laid repairs are never required, and all roofs a guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGE TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower a quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and f SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 sup ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

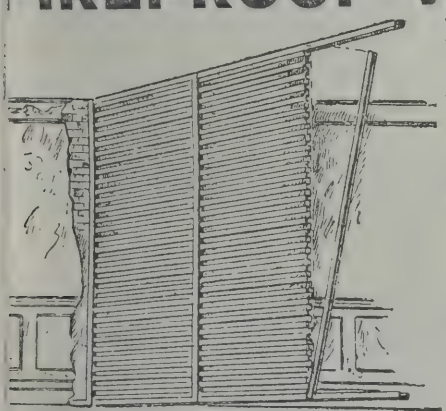
raising the condition of the workmen, but it is equally certain that some of their methods are infected by gross economic error, and have tended not merely to the raising of wages, but to the restriction of the production per head. The prevalence of these errors, and the serious results of the recent industrial wars, in which the trade unions are ranged on one side and the employers on the other, have set thoughtful men in all classes searching after some new form of industrial organism which will take the men out of the position of mere wage earners (to the conservation and protection of which position the efforts of the trades unions are directed) and make them partners in the whole produce of their industry. The germs of such developments have already shown themselves in the co-operative manufactories and in the labour partnerships, which have in some instances made promising progress, with every indication of success in the removal of the fatal rivalries referred to.

The evolution of such new collective fabrics, so devoutly to be wished by all friends of the working classes and by all patriotic citizens, is just one of those improvements which experience and theory show to be impossible of development in the sterile medium of government routine. Further, the action of the trading municipality, always insisting on trades union regulations being observed, not only in its own works, but even by the manufacturers or contractors who deal with it, does much to hamper the free spirit of experiment in these directions, and to retard the operation of those spontaneous tendencies which in an open market would work toward the accomplishment in due time of such new industrial plans.



There is no need, however, to draw upon the imagination to illustrate the deplorable effects of the enslavement of free energies which results from handing over an industry to municipal enterprise. We have one existent example of it in the state of the electrical industry.

How is it that this country, which taught the world the use of steam, should be so backward in electricity? How is it that whilst great systems of electrical power transmission are common in America, in Italy, in Germany, in Austria (constituting, as such systems do, an important new development in the division of labour, by enabling the small workman in a remote village to obtain his power on tap, as it were, and so to produce almost as cheaply as can be done in the great steam workshops in the town), Englishmen are content with insignificant installations in monopolised areas? How is it that while English machinery in the mechanical departments still holds its supremacy at home as well as abroad, in electrical matters we have to give place to other nations, and the whole of the plant for the electric traction of the underground railways of London is being ordered from America, and also that for the tramways of Leeds, of Liverpool, of Sheffield, of Glasgow, and of many more towns that can be named? Surely this state of things can only be accounted for by the unwise action of the Legislature in discouraging and restricting the enterprise of the capitalist and in committing this promising industry to the sterile and monopolist hands of municipal enterprise. What is the history of this subject?

Parliament yielded to the fears of gas-owning corporations (municipal adventurers are always protectionists of the most timid order) and the Electric Lighting Act of 1882 was passed. Under this Act the municipal authorities were enabled to obtain power to supply electricity under license or provisional order from the Board of Trade, but private capitalists who might apply for such power were subjected to two disadvantages—first, they had to obtain the consent of the local authorities, and, secondly, the municipalities could, at the end of the twenty-one years, step in and acquire the undertaking at the then value of its material effects without paying anything for compulsory purchase, or for prospective profits, or for the cost of pioneer and educational work. In effect, therefore, municipal enterprise was encouraged to embark in this promising field, and every obstacle was thrown in the way of private enterprise doing so. The result was, of course, that the discouragements were too great for private adventurers to encounter, and they soon left the business alone. The municipal trader, in spite of the legislative encouragement, remained true to his tradition of taking no risks and of avoiding new inventions. He sat down and did nothing, and the industry stagnated until 1888, only one provisional order having been granted in the previous four years. Parliament then thought it time to interfere, and passed an amending Act by which, while the encouragements to the municipalities were not one bit abated, the obstacles to a private enterprise were partly removed by the extension to forty-two years of the period during which the concern was exempt from expropriation by the authority.

Still municipal enterprise stagnated, but commercial adventure made a fresh start, and almost all the existing electric stations were established in London, in Liverpool, in Sheffield, in Nottingham, in Birmingham, and all over the country by electric companies. In many cases the undertakings of these companies have since been acquired by the town before the

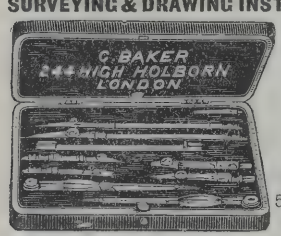
right of compulsory purchase matured, at of course a handsome price, for a municipality can never drive a good bargain in an open market, and with the tardy advent of the municipal trader his monopolist tendencies begin to assert their mischievous influence. There is not of right any monopoly in electric supply in this country. The first section of the Electric Lighting Act of 1888 reads as follows :—"The grant of authority to any undertakers to supply electricity within any area, whether by license or provisional order, shall not in any way hinder or restrict the granting of a license or order to the local authority or to any company or person in the same area."



Whenever electric stations belonged to companies the local authorities were most anxious to take advantage of this section and to promote competition. They readily gave their consent to two or more rival companies working together in the same area. In London, for instance, there are two electric companies competing against each other in every parish, except the City, and in Westminster there are three. But what was sauce for the company goose was by no means to be sauce for the municipal gander. When the means of insulating high-tension currents became improved, it was discovered that the parochial limits (which were fixed, we are told, in the time of Alfred the Great) did not form a scientific division for confining a peculiarly elastic and transmissible force. Some parties therefore proposed, in full reliance on the section of the Act of Parliament above quoted, to establish electric transmission systems on a much larger and more modern scale than has hitherto been known in this country, and, in consideration of the economies that would thereby be effected, to subject themselves to a maximum charge less than one-half the rate which the corporations were authorised to charge, and were, as a general rule, charging for the electrical unit.

This interesting and novel proposition was submitted to Parliament last year. No monopoly was sought for the company, who merely wished to trade in competition with any existing stations, just as a new railway seeks power to compete in the carrying trade. The right to disturb the streets was confined to cases where the authorities refused, unreasonably, facilities for the deliverance of the company's wares through the Corporation's wires. The proposal was welcomed by the trading community, as one would have expected. The Chambers of Commerce petitioned in its favour, and no one opposed it except the municipalities. The nature of their objections is sufficiently indicated in the following recent resolution of the Municipal Corporations Association, passed in reference to this very Bill :—"That this Association affirms the principle that where local authorities have, with the sanction of Parliament, established or are in course of establishing undertakings for public benefit, and have not failed in their duties, it is not right or expedient that powers should be granted to companies to compete with them."

Surely here we see the municipal trader in his true colours. He does not wish to trade in the same way that any commercial man trades, facing difficulties as they come, contending with his rivals, whoever they may be, adapting himself to new conditions, scrapping his existing plant as soon as it is superseded, and substituting more efficient plant often at great sacrifice. Your municipal trader won't hear of scrapping superseded plant. He wants protection for the ratepayers' trade. If science has shown that he is on the wrong lines, and has made an improvident investment, so much the worse for science, which must go to the wall before the necessities of municipal trading. Science must wait until his machinery wears out; that will be quite time to introduce anything new.

The Bill, however, having in principle received the approval of a joint committee of the two Houses, was passed by the select committee of the House of Lords. At both these inquiries the corporations were strongly represented, and clauses were inserted for the protection of their interest. Not content with this, however, these bodies continued their hostility, and took the course, unusual in the case of a private Bill, of organising a strong opposition to its second reading when it reached the second House. There was thus presented the strange spectacle of the corporations opposing the granting of facilities to traders whose advent to their town their own Chambers of Commerce were actively supporting, and whom the same corporations would, as they candidly admitted, have themselves cordially welcomed had they appeared a year or two earlier, before they the corporations had embarked in the electrical business. The opposition was conducted not in the usual way, each town upon its own bottom, but by a kind of centralised union of corporations, called the Municipal Corporations Association. This body raises its funds for such proceedings by a rateable levy over the whole of the affected towns, so that, although ostensibly preserving its local character, the opposition is centralised and rendered unamenable to local influence. Further, such an organisation wields a power which, for the purpose of a second-reading opposition in the Commons, is most formidable. For the Association calls upon the corporations all over the kingdom to bring pressure upon their

respective borough members, so that in this case, which could not affect the interests of a single person north of Barnsley or south of Derby, the member for a borough in the north of Scotland and the member for one in the extreme south of Ireland would be whipped each by his own town clerk to vote against this private Bill. When it is borne in mind how great (and, speaking generally, justly great) is the Parliamentary influence of the corporations, whose councillors are elected very often through the same organisations as are employed for the political elections, it can readily be conceived how great a bar to the initiation of an enterprise which requires Parliamentary sanction is the mere risk of having to face such an opposition. It is hardly too much to say that such a one-sided use of the united power of these local bodies (power granted, be it remembered, for the common good, not for the protection of selfish interests) for the purpose of stifling a new enterprise at its birth, and so securing for themselves a monopoly which they would not otherwise be entitled to, savours more of oppression than of fair dealing. Now, oppression is not to be tolerated on the part of our local bodies. If we were capable of tolerating injustice we should cease to be a people worthy of free institutions, and if the effect of the acquisition by the corporations of these trading undertakings is to put partiality in the seat of authority, then the cost of municipal enterprise will be much more serious than any that has yet been contemplated.

Surely the corporations have forgotten the sins whereof they have been purged. It was because of the monopolies and restrictions which the old self-elected corporations imposed on the trade of the towns that, strong as they were in Parliamentary influence (for the old corporations actually elected the borough members themselves), they forfeited the public confidence, and they were abolished by the Act of 5 and 6 William IV., cap. 76, section XIV. of which read as follows :—"Be it enacted that, notwithstanding any custom or by-law, every person in any borough may keep any shop for the sale of all lawful wares and merchandise by wholesale or retail, and use every lawful trade, occupation, mystery and handicraft for hire, gain, sale or otherwise within any borough." The consequence of this new policy of freedom for industry is the extraordinary growth of population and resources which has succeeded the reform. But the oppressive treatment of the electrical traders would seem to indicate a reactive tendency towards the old mischief again.

All this points to yet another danger of municipal trading —a danger, that is, to the stability of the municipal institutions themselves. These institutions, which are the most ancient, and, as they exist to day since their constitution was broadened by the Act referred to, among the most efficient examples of the self-governing faculties of our race, are deserving of our uncompromising support. The towns are, besides, dependent upon them to an incalculable extent for some of the first necessities of modern life. It is therefore a duty imposed on all by self-interest, as well as by gratitude and patriotism, to point out fearlessly the insidious error which is creeping into the practice of these bodies, and to use every effort to arrest it before the decadence becomes irretrievable. It would be wrong to overlook the serious state of the municipal institutions of America, arising, as competent advisers tell us, from the unlimited enlargement of the functions of the Government. The consequence is that public employment is excessively multiplied, and the municipal debts have risen to colossal dimensions. The affairs of the cities are left to professional politicians, and are conducted in such a nauseous atmosphere of class corruption and party trickery that the better class decline to have anything to do with them. A distrust of the servants and representatives of the people is everywhere manifest. We are a long way from such a state of things in this country, but can it be doubted that this ambition to embark in trade will be injurious to the corporations?—for their efficiency must depend, not upon the profits which they may be able to make out of their various trading advantages, but upon the degree to which they can absorb into themselves the energies of the most capable citizens. Is a course of action which puts them in competition with their own traders, which results in the imposition of something like an octroi duty upon a commodity that is fast becoming the necessity of every manufacturer, calculated to secure the respect of the trading community? Further, is it calculated in the long run to secure the respect of the working class? The expenditure of public money in a district; the establishment of municipal works; the employment of large numbers of the ratepayers at municipal wages; these are very popular things while they last, but they are also very difficult things to stop, for they necessarily create in the minds of the more ignorant of the ratepayers false ideas of the functions of the local government. How can you blame the wage-earner if he comes to think that it is the duty of the municipality to find employment for him, and how can you blame him if, when the inevitable disillusionment comes, he is disappointed and disgusted on finding that he is mistaken? Municipal trading is thus infected with the communistic poison. It begins

by alienating the confidence of the manufacturers, and ends by alienating the confidence of the workmen from institutions which, so long as they confine themselves to their proper functions, are productive of such great good to the country. Surely, therefore, the corporations would be well advised to confine their functions to those important public matters in which all their constituents are equally interested, and which must of their nature be performed by the ratepayers in common, and which involve no taint of partiality or suspicion of class bribery; such are the administration of justice and police, the care of the public health, the provision of parks and open spaces and so forth. Let them leave to private enterprise whatever private enterprise will undertake, keeping themselves in an impartial position, so that they may secure the unsuspicious loyalty and obedience of all the traders to the regulations which they impose upon them for the protection of the common interest. Let them adhere to the spirit of the constitution of Alabama, which declares "That the sole and only legitimate end of Government is to protect the citizen in the enjoyment of life, liberty and property, and when the Government assumes other functions it is usurpation and oppression."

A policy of antagonism to the trading companies on the part of our corporations would be an undoing of their own work. The immediate cause of the active commercial energies of which so much jealousy has been expressed is the liberty which has been secured to the individuals in the towns by municipal institutions, "that liberty which is the nurse of all great wits," and for these institutions to interfere with and repress trading liberties is both unnatural and self-destructive.

The following words, addressed by one of the great apostles of liberty to the Lords and Commons of England, so long ago as the first half of the seventeenth century, are still pregnant with wisdom worthy of the attention of our reformed municipalities on the eve of the twentieth :—

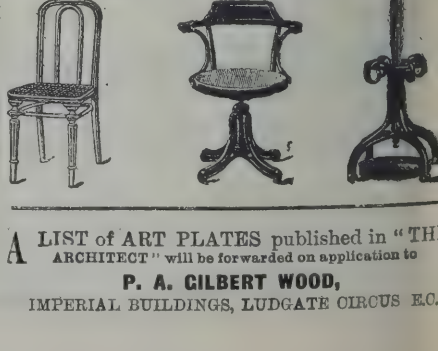
"Ye cannot now make us less capable, less knowing, less eagerly pursuing of the truth, unless ye first make yourselves, that made us so, less the lovers of our true liberty. We can grow ignorant again, brutish, formal, slavish, as ye found us, but then ye must first become that which ye cannot be, oppressive, arbitrary, and tyrannous, as they were from whom ye have freed us."

SOCIETY OF ENGINEERS.

The first ordinary meeting of the Society of Engineers for the present year was held on Monday evening, February 6, at the Royal United Service Institution, Whitehall. Mr. William Worby Beaumont, the president for 1898, occupied the chair, and presented the premiums awarded for papers read during that year, viz.:—The President's Gold Medal to Mr. William Fox for his paper on "Reservoir Embankments, with Suggestions for avoiding and remedying Failures." The Bessemer Premium to Mr. Sherard O. Cowper-Coles for his paper on "Protective Metallic Coatings for Iron and Steel." The Rawlinson Premium to Dr. J. C. Thresh for his paper on "The Protection of Underground Water Supplies," and a Society's Premium to Mr. George Thudichum for his paper on "Bacterial Treatment of Sewage."

Mr. Beaumont then introduced the President for the present year, Mr. John Corry Fell, to the meeting, and retired from the chair, receiving a hearty and unanimous vote of thanks for his services during the past year.

Mr. Fell then proceeded to deliver his inaugural address.



After thanking the members for having elected him to the chair, the President referred to the present position of the Society and the work of the past year. Its financial position, he said, was very satisfactory, as shown by the auditors' report and balance sheet, and it had increased its numbers during 1898. The papers read had been of the usual interesting and practical character, and the visits made to works during the vacation had been equally interesting and instructive. He regretted to say that during the past year they had lost by death no fewer than six of their honorary members, namely, Sir William Anderson, Sir Henry Bessemer, Sir James N. Douglass, Sir John Fowler, Lord Playfair, and Sir Robert Rawlinson. The Society, however, was honoured by having the vacancies thus created filled by Sir John Wolfe Barry, Sir Albert John Durston, Sir David L. Salomons, Prof. A. B. W. Kennedy, Mr. W. H. Preece, and Mr. Alexander Siemens.

Turning next to the question of the protection of inventions by patents in engineering practice, the President pointed out that it was a curious fact that civil engineers availed themselves less than any other members of the profession of the privileges accorded to inventors by patents, designs, or copyright pro-

tection. This, he said, was perhaps due to the circumstance that civil constructive engineers took a higher professional standpoint, and considered that the credit attached to their designs, however useful or beautiful, was a sufficient reward without seeking to retain a monopoly in them by patents, even for a time. This view, he said, did not extend to the mechanical branches of the profession, where every little detail improvement in machinery was protected, and a commercial end thus served. He did not, however, see why the same principle should not be observed by the civil engineer in regard to bridges, roofs, girders and the like constructive details.

As regards invention as represented by nationalities, the President observed that it had been said that the British nation was less inventive than the American. Prior to 1883 that view appeared to be supported by the number of patent applicants in the United States as compared with those in Great Britain, which in 1883 was over 30,000 for the United States, and barely 6,000 for Great Britain. This discrepancy appeared to have been accounted for by the high rate of Government fees in Great Britain, which were much in excess of those in the United States. Upon a reduction of the fees in 1883 the applications rose from 5,993 in that year to 17,110 in 1884, and they had now reached over 30,000 per annum, and Great Britain now took a foremost place in the inventive world. Taking an average of the last ten years, about half the applications come to completion. About 20 per cent. of the completed, or 10 per cent. of the applications, are renewed up to seven years, and 5 per cent. of the completed, or 2½ per cent. of the applications, are maintained to fourteen years.

With regard to successful invention, the President observed that the conditions should be the result of analysis or synthesis, not mere chance dashes into an unknown field. The method of analysis may be defined to be first an appreciation of a want to be met, with which the inventor is familiar, and then, by a laborious selection from what is known, the development, by successive efforts, of a combination of suitable means to meet the want.

The President then went on to point out the necessity of having a special court for the trial of patent actions. He had for long past been of opinion that such a court should be established, and of late the Lord Chancellor and other judges had expressed the same views. They had publicly attributed the block in the Law Courts to the increasing number of patent casec and the inordinate time many of them occupied. So serious was the condition of matters that the Lord Chancellor upon one occasion intimated that it might be necessary to hand over to a special tribunal the trial of cases for which the ordinary method of procedure appeared to be inapt. Mr. Justice Romer, too, who has had very considerable experience in trying patent cases, has also expressed the opinion that it was a great hardship that the proper business of the Court should have to wait for the trial of prolonged patent actions. The President pointed out that the remedy undoubtedly was the establishment of a Patent Court presided over by a judge possessing the necessary qualifications for dealing with patent actions, and whom it would not be difficult to find.

The President then proceeded to give a short summary of the advances made of late years in various departments of engineering, in which he first referred to the increase in horse-power in engines which was obtained from a minimum of dead weight of material, and he explained the way in which it had been effected. In steam boilers, too, great advances had been made by the development of the water-tube system. He then referred to the progress made in electric lighting, and in the application of electricity to the driving of machinery, especially in its use on railways. In this latter connection he described the recent development of the electric railway system in the metropolis. Improvements in gas-lighting and the progress of acetylene as an illuminant were then discussed, and, finally, the latest phases of naval construction, including submarine torpedo-boats, were considered.

The address was listened to with marked attention by an appreciative audience, and at its close a hearty vote of thanks was accorded to the President.

HOUSING OF THE WORKING CLASSES.

A REPORT on the application of the Housing of the Working Classes Act to local requirements has been drawn up by Alderman W. Thompson, of the Richmond (Surrey) Town Council, at the request of its health committee. Mr. Thompson goes into the question thoroughly with figures and full details, devoting special attention to the dwellings for workmen erected by the Richmond Council. In his general survey of present conditions he points out that, broadly speaking, the housing difficulty in large towns is essentially a land question and in rural districts a wages question, and that in order to prevent recurring and increasing evils in this respect it will be necessary

to devise some means for dealing with the "corner" in urban land values and with the improvement of the income of the agricultural labourer. The attempts made to deal with similar districts are described. In Liverpool accommodation is provided at the rate of about 1*s.* per room per week. The rent for two rooms and a scullery is 2*s.* 6*d.* a week. There is no loss, and it is possible the terms may be reduced. In the dwellings provided by the London County Council the rents vary from 3*s.* 6*d.* to 5*s.* for one room, and 8*s.* to 12*s.* 6*d.* for four rooms. The Artizans' Dwellings Company provide accommodation in Noel Park at 6*s.* per week for four rooms and 11*s.* for eight rooms. The Alderman grafts another scheme on his housing project, for he would confer on a tenant who had paid 1*s.* 4*d.* a week in his ordinary rent towards the sinking fund, at the end of forty-two years, an old age pension of 5*s.* per week in the form of rent charges on the houses. "It is desirable, then," Mr. Thompson concludes, "that every encouragement and facility should be given by the Legislature to the sale and appropriation of sites for workmen's dwellings, and for the continuance of cottages on existing sites." The following are among the recommendations made to assist in this direction:—That owners of all unoccupied land (except open spaces, parks, and other specially exempted lands) in urban districts should be required to declare the fair market "site value" of such land, and that it should be rated for local purposes on a percentage of half such "site value"; that local authorities should be empowered to take vacant land compulsorily for workmen's dwellings at the fair market "site value" thus obtained by a simple procedure on the lines of the Allotments Clauses of the Local Government Act, 1894; that both the State and the local authorities should give facilities for the extension of light railways, tramways, and workmen's trains to the outskirts of large towns at cheap fares on the zone system; that the Government should lend money to local authorities for erecting workmen's dwellings at 2½ or 2¾ per cent.; that in every district a standard rental per cubic foot should be fixed for workmen's dwellings, and that total or partial exemption from existing and future land taxes or taxation of ground values should be granted on a sliding scale (according to rental) to municipalities, companies, landowners, and others letting their cottages below this standard rate (a rental of 6*d.* per room per week in rural districts, and 1*s.* per room per week in large towns, with intermediate amounts for small towns, is suggested as a fair basis for arriving at a definite conclusion on the subject of such standard rental); that half of the rates of such cottages should be remitted, as in the case of the Agricultural Rating Act, the money to be obtained if necessary by a tax on ground values or a municipal sur-tax on the death duties; that no cottages should be entitled to such exemption except such as the sanitary authority should certify to be in a proper sanitary condition. Mr. Thompson puts forward as a reform urgently needed the extension of the period for repayment of loans made in connection with municipal workmen's dwellings. He would like to see the time extended to 100 years in the case of land, and to sixty years in the case of buildings and other works, and he recommends that steps should be at once taken by local authorities to secure this change.

PATENTS.

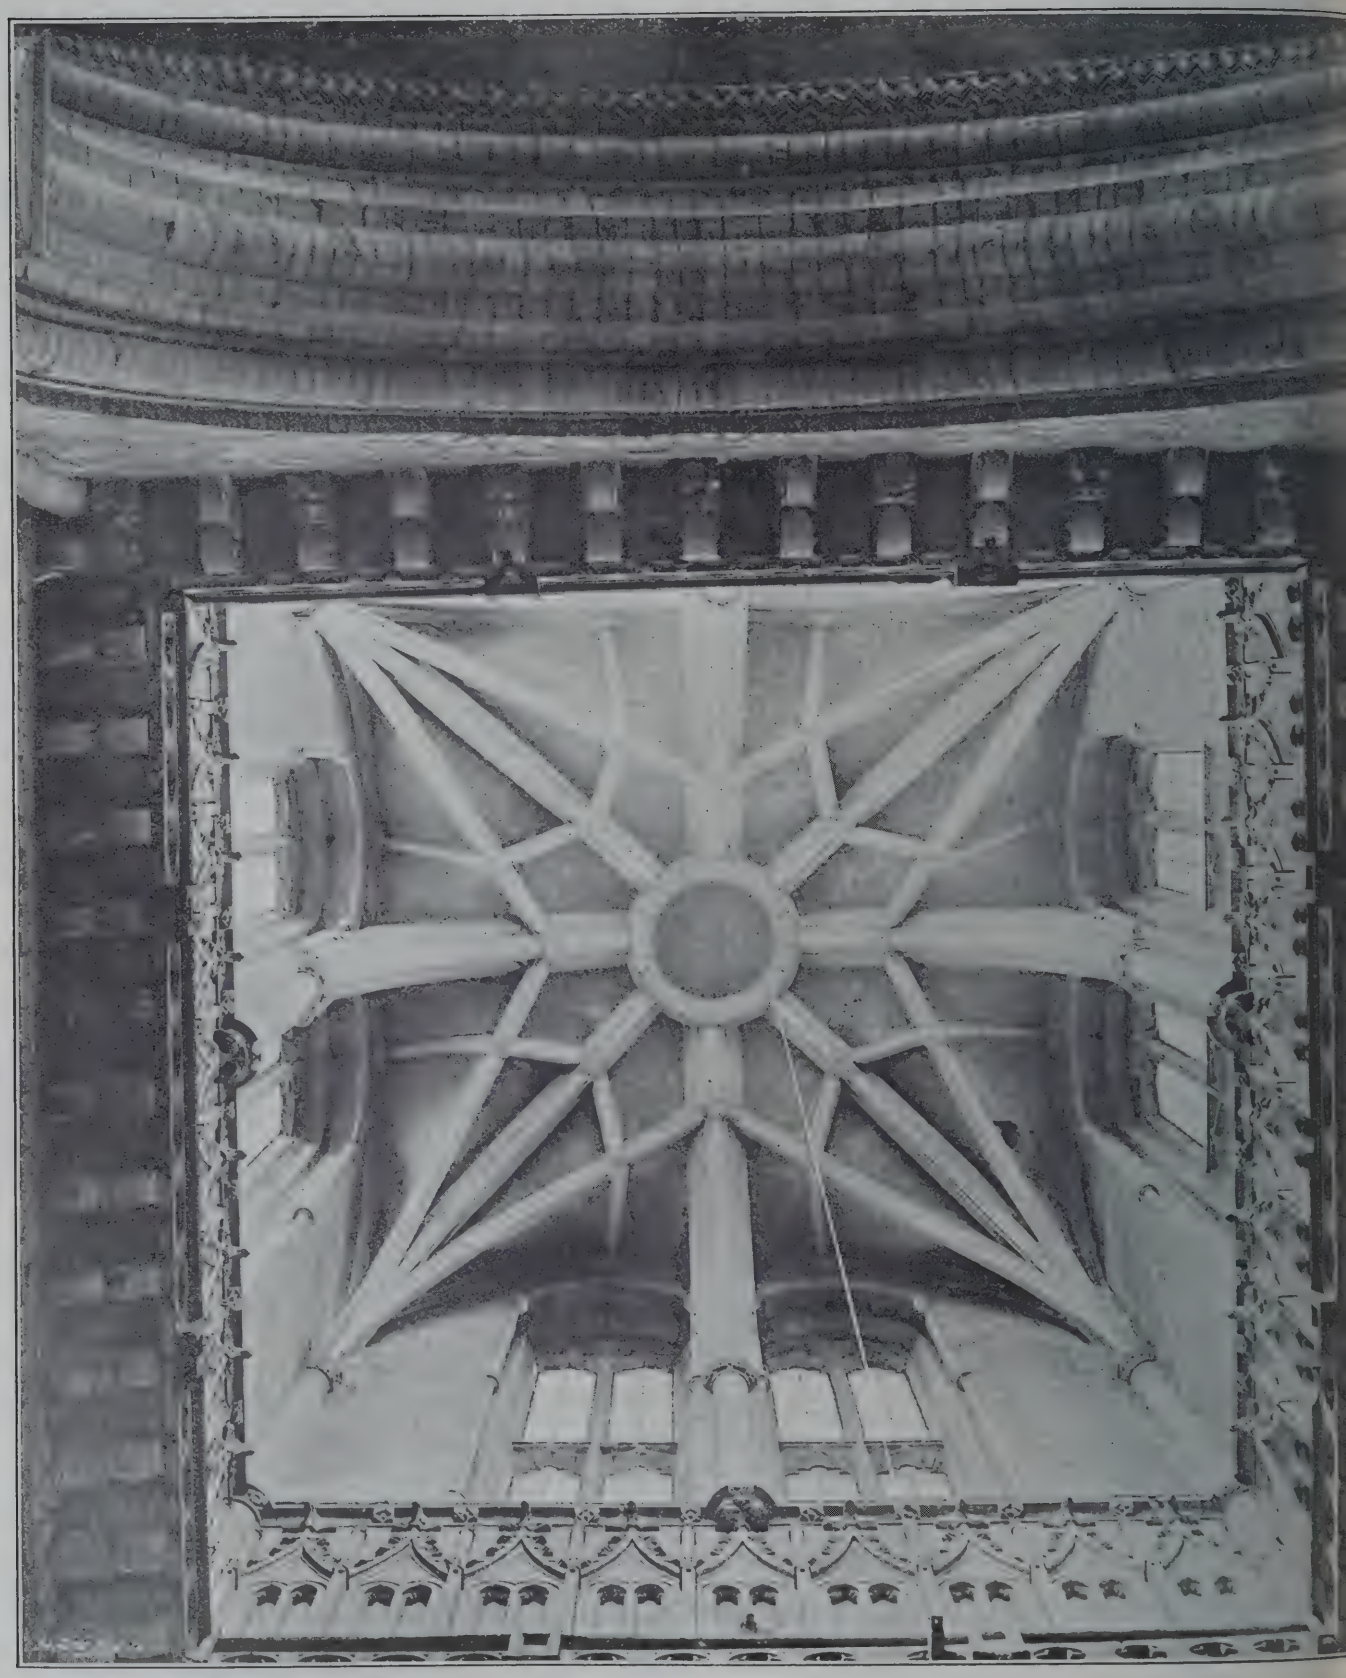
[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

1558. Lewis Benson Kennedy, for "Improvements in brick presses."

1565. Edward Henry Hurry and Harry John Seaman, for "Improved refractory-lined rotary cement furnace and method of lining the same."

1573. Hugo Werths, for "An improved process for the production of building stones, bricks, and like articles."



1756. Preston Davies and Edward John Vavasour Earle, for "Improvements in and relating to drying apparatus applicable for use in the manufacture of Portland cement and for analogous purposes."

1762. John French Golding, for "Improvements in the construction of partitions for buildings and other structures."

1987. Julien Flueret, for "Improvements in building construction."

THE WEEK.

FROM what was said in the House of Commons this eek it would appear that the contest between science and rt for the ground at South Kensington has been arranged. he Royal College of Science on the east side of the xhibition Road will continue to be devoted to scientific urposes, although not necessarily for classes. But the ther buildings which science demands are to be erected n the western side of the road. Art will consequently be ble to monopolise the land on the east side. It is under- ood that the new buildings for the enlargement of the outh Kensington Museum will be shortly commenced, nd it is hoped that the foundation-stone will be laid by ER MAJESTY early in the autumn.

THE differences between estimates and accounts for orks executed which arose in some of the buildings of the etropolitan Asylums Board have made it necessary to ggest that a new system of conducting works was to be lopted. If hospitals have to be raised to meet epidemics cannot be expected that the work will be as economical that in ordinary buildings where there is no hurry. oreover, it is necessary in hospitals to aim at extra curity, for as there is a host of rival theorists to be tisfied no ordinary precautions will suffice. The public o not realise those plain facts, and they imagine that spitals can be very safe and very cheap. They will be atified when they learn that for the future "every archi- t employed by the managers be engaged under an agree- ent sealed by the Board, and that it be referred to the works mmittee to draw upon and submit to the managers the m of such committee." The works committee being of inion that the principle which this motion embodied should affirmed, instructed the clerk to draw up the draft of an reement with an architect, and they recommended that ery architect employed by the managers be, as a general le, engaged under an agreement sealed by the Board. They o considered the question of the desirability of laying wn certain regulations having reference to the duties, ges, &c., of clerks of works in the managers' employ, and ich they had prepared, and recommended that the power appointing clerks of works and of fixing their remunera- n be delegated to the works committee. The new system inspired by a decree to promote economy, but we doubt under circumstances like those which prevailed during ent years the cost per bed can be much diminished by e most elaborate agreements with architects and clerks of rks.

THE proposal to sell TELFORD'S Menai Bridge to the al authorities of Carnarvonshire and Anglesea for ,000*l.* will, we hope, lead to the conservation of a struc- e of which England should be proud. The bridge was mmenced eighty years ago, and took about seven years complete. A more graceful structure of its class is not be found, and it has stood well. It is commonly sup- sed that the early engineers were indifferent to the ength of materials, but TELFORD insisted on each bar ing tested by a strain of 11 tons per square inch. It s assumed that the tenacity of the best Shropshire iron s 50,000 lbs. per square inch, which was not an exaggera- n. About 2,200 tons were used. For the masonry glesea grey marble was employed, the price paid by the vernment for it being 6*d.* per ton. The masonry of the rs above the roadway was strengthened by drilling holes ough the stones of each course, in which iron bolts were erted. There are four sets of main chains, each being de up of 935 bars. The saddles and ties for them are cast-iron, and TELFORD adopted the precaution of g on the apex of each pier wrought-iron rollers in order ovide for any expansion or contraction of the chains. ridge on the same principle would not now be attempted, l for that reason great care should be taken of LFORD'S work, for it marks an era in the history of civil ineering.

ENGLISH judges generally hold that when a building in progress is destroyed by fire the contractor cannot recover from the building owner, and the same rule applies to contracts for additions unless in special cases where the damage is unforeseen. But if there is a clause to rebuild in case of fire the contractor will of course be liable. Fortunately cases of the kind do not often occur in England, but an action relating to a fire has been tried in Hamilton, Canada. A building was being altered when a fire broke out. At the time a balance of 1,000 dols. was due to the builder for work done and material supplied since the last certificate was issued. The owner declined to pay because, by one of the clauses in the contract, he was to be relieved from liability in case of fire arising during the progress of the work. A common clause relating to the owners insuring the premises was struck out, and it was therefore inferred that the builder was to have secured himself against such a contingency by insuring. The owner had not received any money on account of insurance, and Judge SNIDER decided that there was no fault on either side, but the fire had determined the contract, and there was no cause for action. The suit was dismissed, but the action is likely to be heard again on appeal. There will be differences of opinion among lawyers about the judgment. By an American case which was decided some twenty years ago it was laid down that where a sub-contractor has performed substantially all he contracted for, and, before the entire work is performed by the principal contractor, the building is destroyed by fire, and the owner and the original contractor make a settlement in which deduction is made of the value of whatever remained unperformed on the sub-contract, the sub-contractor is entitled to recover for the work actually done by him, notwithstanding that the sub-contract is not completely performed. Now, in all equity, a similar principle should be applied to the relations of contractor and building owner. All materials supplied should be paid for, and any labour that was completed, the architect being the sole judge. In America, owing to the numerous fires, the law on the subject should be more definite than it appears to be. But English builders should derive a lesson from the HAMILTON case. There is a little uncertainty in English Courts about the application of law, and on that account it will generally be prudent to take the precaution of insuring as far as companies are prepared to go, for the premium to be paid is not easily ascertained.

THE paintings by JOHN PHILLIP are now so costly the humble origin of the artist is likely to be overlooked. According to Mr. ROBERT WALKER, who delivered a lecture in Glasgow on the painter, PHILLIP began life as a messenger in a tinsmith's shop, and afterwards was apprenticed to a house-painter. He received little instruction before he painted signboards, and then advanced to portraits. Determined to see the Royal Academy exhibition, and having no money to go to London in a regular way, he hid himself as a stowaway on board a brig belonging to a friend of his father's. Arrived in London, he was kept two days shifting cargo, and got one day to himself to see the exhibition. He made a long day of it there, went back to the brig, and returned to Aberdeen. Shortly after his return his work attracted the notice of Major GORDON and Lord PANMURE, the latter of whom generously offered to defray the cost of young PHILLIP'S art education in London. PHILLIP attended the Academy schools, made steady progress, painted portraits, and exhibited at the Academy and other London exhibitions. He returned for a few years to Aberdeen, and finally settled in London in 1847. He had by this time painted several very meritorious pictures, mostly of Scottish subjects, something after the style of WILKIE. The turning-point in his life came in 1851, when, on account of a failure in his health—his health never was good—he paid a lengthened visit to Spain. His art henceforward took a more individual and more vigorous form of expression. Influenced by the great pictures he saw, and by the picturesque and strange life that environed him, he gave free rein to his natural love of colour and vivacious composition, and became a distinctive artist, whose work commanded the attention of both fellow-painters and the public. Henceforward his chief triumphs were won in depicting Spanish scenes. His death came suddenly in 1867, when he was barely fifty years of age.

THE LEIGHTON BEQUEST.

DURING Lord Leighton's lifetime it was not generally supposed he was wealthy. The prices he received for his pictures were below those paid to several of his contemporaries. On the other hand, his position necessitated a large outlay. Officially he was the representative artist of Great Britain, and it was incumbent on him to demonstrate the fallacy of the ordinary notion of the inevitable tendency of artists, and especially of painters, to gravitate to a Bohemian existence. The President was a fine gentleman by nature, and did not need any aid of a Turveydrop to acquire the polished air of which society approves. He exemplified in his own person the happier condition of modern painters when compared with their predecessors. It seemed incredible that he could have belonged to a body of which one prominent member named James Barry appeared in the streets wearing a coat of green baize stained with paint, and another named Richard Wilson was glad to turn his unsold Classic landscapes into waistcoats. Neither of those early Academicians could have anticipated a time when a painter who produced few portraits, and who endeavoured to follow ideals which were not those of the market, would be able to enjoy not only comfort but luxury. But still more remarkable to those artists and many who followed them would be the fact that after living expensively Lord Leighton would have bequeathed 10,000*l.* to the Academy. Not one of his predecessors in office was so munificent. And yet they had fewer calls on their purses, and the majority of them as portrait painters followed a branch of art which is the most liberally rewarded of all in this country. In many ways Lord Leighton departed from precedents, but never was he more original than when on his death bed he requested his sisters to give so large a sum to the institution he had adorned.

The gift being unrestricted by conditions, it has required a couple of years to determine the purposes to which the money could be most fittingly applied. The Academicians, while endeavouring to use the bequest for the advantage of living artists, would naturally wish to create a memorial of the generous donor. Lord Leighton was so wide in his sympathies, a disbursement for any purpose connected with art could easily be associated with his name. But as a thinker there was one purpose which seemed paramount with him, and that was the application of art for the public benefit and delight. In his first presidential address we find him regretting that through the absence of fostering conditions works of art are now too often considered as merely profitable merchandise or vehicles of speculation. He followed Agrippa in believing that works of art were far more useful when seen in public places than when exiled in private mansions. But as the President knew, the private commissions produced most lucre, and therefore he warned students, saying, "The day on which the deadening fumes of this insidious lust for gold cast their first blurring mists across the pure light of his ideal is the herald of a struggle on which hang not only the wreck or the triumph of his better self, but the marring or the maintaining in his art of whatever is that better self's reflection."

The Academicians have therefore decided that the money is to be expended not in remembrance of Leighton the painter of easel pictures which were marked by prettiness, but of Leighton the advocate of the beautifying of public places, covered or uncovered, and the versatile artist who admired architecture and sculpture equally with painting. He had made sacrifices to promote wall painting, and was ready to do more in that way if the public had been less indifferent. The resolutions of the Academicians are as follows :—

That the money received from Mrs. Orr and Mrs. Matthews, sisters of Lord Leighton, P.R.A., in memory of their brother, be invested in Consols or other securities allowed by law as a separate trust fund to be called "The Leighton Bequest." That the income derived from this fund be spent in acquiring or commissioning works of decorative painting, sculpture and architecture. The paintings to be placed in public institutions; the sculpture in or on public buildings and in the open air, such as in parks, squares and streets; the architecture, alone or in combination with sculpture, to be in the form of fountains, seats in marble, bronze, or stone, lamp-posts and similar objects for the adornment of public places. The income of the fund not necessarily to be spent annually, but, if thought desirable, reserved and accumulated for a period not exceeding five years.

It will be observed that the inconvenience caus by one of the conditions of the Chantrey Beque will not be repeated. The sculptor, or rather his lawye insisted that the only works which were to be purchas must have been exhibited; but the highest class of wo are not necessarily to be seen in exhibition rooms. Unc the Leighton Bequest works can be commissioned as w as acquired, and the fear of the risks which must be curred in producing examples of decoration need no long be an obstacle.

If we assume that the sum available is 400*l.* a year interest on 10,000*l.*, then by refraining from a purchase five years there will be 2,000*l.* to expend on a single wo It is possible, however, that under existing circumstanc more benefit will be derived by adhering to an ann outlay. There is a notion that such work as is conte plated is exceedingly costly. Consequently individu hesitate about giving commissions which they believe wo involve them in an expenditure of some thousands pounds. When Baron Grant transformed Leices Square, although the sculpture is not of extraordinary me he had to provide a sum which few but company promot could afford to give away. His spirited action was imitated. Municipal authorities are also prevented fr expending much money on art in any form. But if it co be demonstrated that there were artists who were sec against the fumes of the insidious love of gold, and who four or five hundred pounds could enrich a public place w something which, although of modest proportions, was a th of beauty and therefore a joy for ever, then we might exp to see many patriotic citizens prepared to give commissi for such ornaments. We believe that ignorance about extent of responsibilities is as operative as indifference preventing people from enriching towns with decorat painting and sculpture. If another "Man of Ross" w to arise with as much esteem for the æsthetic as for useful, he would demonstrate that art is not beyond attainment of philanthropists who are not millionai John Kyrle would at least endeavour to realise Ruskin's advice :—"If you carve a piece of stone and it on the outside of your house it will give pleasure every person who passes along the street—to an innun able multitude instead of a few."

Abroad if not with us there are many instances works which embellish towns and cities with their cha and yet could not have been very costly. The "Go Merchant" of Nuremberg is a personage of unive renown. So is the impudent "Manikin" of Brussels, has his tailors and officers. Quentin Matsys's "Well" several niches at the corners of streets have helped to incr the reputation of Antwerp. It requires education appreciate Notre Dame, Paris; but the wicked spirits seem to revel in the confusion of Paris are better kn than any of the literary cynics. In old German to fountains are to be found which gratify all eyes without diminution of their hydraulic usefulness. Very s squares are to be found in Paris which by the introduc of a statue or two become entirely different from our ra enclosures. What is needed in England is some on take the initiative and to provide works of lighter more pleasing character than the massive portrait-sta which usually appear to be out of place when surrou by trees or shrubs. They are generally memorials respect which is not enduring. The men who are supp to be "historic celebrities" very often are forgotten be a generation passes, and it is hard on people hereafter we should appear to insist on their acceptance of favourites, whose claims to esteem may be falsified in a period.

Unless it can be increased by donations from sources the revenue derived from the Leighton Bec cannot accomplish much. There are opportunities expend one hundred times the amount if such work those suggested by the Academy's resolutions are t realised. But what can be done is to suggest wha practicable, and if a happy selection can be credited t Academy there need be no doubt that liberal support be forthcoming. As in other things, the first effort i hardest to accomplish.

HE EVOLUTION OF THE ENGLISH HOUSE.*

NE of the advantages of the theory of evolution is in giving the *coup de grâce* to the stereotyped method writing histories. That theory is practically inapplicable individuals, for the degrees of progress in one human ing are too infinitesimal to be measured by any philo- phic scale. The old ADAM is still manifest in each of s sons, especially in their weakness, which is as primitive any archæologist can desire. Now, histories used to e concern only about a limited class of individuals who ed in the atmosphere of courts, with an occasional excur- n to battlefields, as if for a change of air. As men of t class are much the same in all ages, the process of velopment could not be exemplified by them. It came therefore necessary to select materials of another d. "The History of Europe" consequently became The History of Civilisation," and GUIZOT supplanted SSELL. "The Social England Series," of which the lume relating to the house is before us, is another tance of the application of the theory. It disclaims graphical aims, for, as Mr. COTES, the editor, says, he stability of law that is seen in a large number of tances cannot be discovered by watching single lives, wever exalted." Consequently, the attempt is being de by him and his co-operators to give an account, t of what the units may have done, but of the work of millions. Instead of vague allusions to the gorgeous- s of palaces, it was proposed to "observe the changing les of building, distinguish the international influence, part that the facility of obtaining material played, and ice the gradual evolution of the rooms, the way that y were adorned and furnished, to see how far in beds l baths, in the provision for study and privacy, civilisa- n was advancing."

Students of architecture have had an inkling of the ject. The Greek temple, with which the art was posed to begin, was usually explained in the first books into their hands to be only a glorification of the Greek tage. The cottage was afterwards supposed to be a ivation of the tent. But so simple a solution of an torical difficulty is no longer acceptable. In our time tages and tents are scrutinised, and little value is ached to them unless shelters resembling them are to be nd somewhere in use on the globe. "Two thousand rs have rolled in vain over the cabin of the Irish sant," was the conclusion of TOM MOORE, the poet, en he attempted to write the history of his country, and hat unfortunate island almost prehistoric conditions of can be observed in other things beside houses, but ewhere progress has signified destruction, and for dence of a vanished past it is necessary to turn to regions ere the law of progress is almost a dead letter.

England has been transformed as much as most coun- s, but there are in it survivals of remote times, and ong them are enough examples of houses to serve the poses of inquirers who desire to contrast the present h the past. The charcoal burner's hut recalls the primi- e circular habitations. There are many references to the stence of dwellings which apparently were similar to it early legends. According to the late Professor W. K. SULLIVAN, who was the most remarkable union of the ientist and the archæologist seen in this century, the ient mode of constructing them in Ireland was "by king two basket-like cylinders, one within the other, and arated by an annular space of about a foot, by inserting ight posts in the ground and interweaving hazel wattles ween, the annular space being filled with clay. Upon cylinder was placed a conical cap thatched with reeds straw." The round hut was not peculiar to the western nds, and, judging by the remains found at Glastonbury, parts of the circle were not at equal distance from the tre. Progress in building is dependent on tools. It comparatively easy to make wattles subservient to the ntions of the old house-builder, but to operate on trees ired aid which he did not possess. It is therefore sible that beehive houses were erected in Ireland for a ; period before the English round houses were aban- doned. The reason is that boulders of small size and other field stones were to be picked up in Ireland and could be used in walling without any change from the form they received during their migrations in the glacial period. It was therefore easy to have a house that was rectangular in plan, like the oratories which are still to be seen on the west coast. But as soon as tools were to be obtained which enabled the races that lived in England to operate on trees a new era began. It could not, then, be said that 2,000 years were to pass in vain over the English habitation, for the power of adapting materials was too fascinating to remain unexercised.

It is remarkable at first sight that a similarity exists between early English houses and great engineering works like the St. Pancras Station, the St. Enoch's Station, the Hall of the 100 Metres in the Champ-de-Mars and many other examples of the latest engineering science, but in all the principle is identical. In one class of structure steel or iron trusses are continued from the ground to the centre of the roof, and thus form supports for the wall filling and roof covering. The western builders took trees from the forest and either bent them or shaped them into a curved form, so that when the pieces met they would form a pointed timber arch which became a principal for the habitation that was to be constructed. The origin of the arrangement is to be sought elsewhere. It probably began with the employment in more northern regions of a rover's boat that was no longer seaworthy as a shelter or dwelling. If DAVID COPPERFIELD firmly believed that Mr. PEGGOTTY'S upturned boat on the Yarmouth shore was a fairy palace surpassing all the Blunderstone Rookeries in the world, may we not imagine that those who had fewer means of comparison would be no less fascinated by arrangements which had withstood the fury of the seas and remained water-tight? The word *navis*, or "ship," from which our word "nave" is derived, suggests that the Romans were also aware of some affinity between boats and buildings. Wherever the framing came from it was an important discovery in English building. As Mr. ADDY says :—

> The wooden framework of a house is often far older than the outer walls, so that the plainest exterior may be accompanied by an ancient and picturesque interior. The change from the ancient method of supporting the roof by pairs of arches springing from the ground to the modern way of supporting it by "pairs of principals" was made very slowly. To us, in these days, the modern roof resting on upright walls of stone or brick seems too plain and simple a thing to be regarded as a triumph of human skill. And yet it is of comparatively modern date in the English popular art of building. Nowhere is the spirit of conservatism more conspicuous than in architecture. As the Romans usually framed their roofs with tie-beam and king-post, it is strange that the English people should have been so long in adopting this method of construction.

The old surveyors regarded the bay as the standard of measurement. Thus, John Harrison, who about the year 1637 made a survey of the estates of the Earl of Arundel in South Yorkshire, speaks of "a dwelling-house of 4 bayes, a stable being an outshoot, and other outhouses are 7 little bayes, besides a barne of 4 bayes." Just as the buildings were measured by the number of bays which they contained, so they were sold or let by the bay, as cloth is sold by the yard. In deeds and wills of the sixteenth and seventeenth centuries houses are very often estimated or described by the number of bays which they contain. Often, too, we meet with deeds of this period in which bays of houses or other buildings are separately conveyed. In Derbyshire hay is sometimes sold by the "bay," and in the sixteenth century a "gulf of corn" was as much as would lie between any two pairs of "cruchs." Holinshed in 1577 speaks of "two-and-fortie baies of houses." In "Measure for Measure" Pompey, the servant, says :—"If this law hold in Vienna ten year, I'll rent the fairest house in it after threepence a bay."

Dr. JOHNSON explained "bay" as a common term in many parts of England for the space between the main beams of the roof; so that a barn crossed twice with beams was a barn of three bays. In Staffordshire the word was applied to "the two open spaces of a barn on each side of the threshing-floor."

The sides, spaces, or aisles were not possible without more skill in construction. A section of a barn at Bolsterstone in South Yorkshire, in Mr. ADDY'S book, shows the difficulty of the builders, who were obliged to employ a vast amount of timber when they wished to have a tripartite

---

* *Social England Series :—The Evolution of the English House.* By Sidney Oldall Addy, M.A. With 42 illustrations. London : Swan Sonnenschein & Co., Limited.

division in their structures. It was necessary to supplement the timber by wattles, with turf or moss for an outer covering. It is often objected to the Irish peasant that he allows a pig to share his cabin, but in the English as in Frisian and Saxon farmhouses, the cattle appeared to be as important as the human inhabitants. It was not until 1419 that the practice of keeping cows and pigs in London houses was prohibited, and long afterwards the custom was retained in the country. The introduction of lofts was an advance in refinement, and, according to Mr. ADDY, "people are still living who remember how farmers' men-servants in England used to sleep on the hay in a gallery or hayloft over the cows."

Town houses being mainly intended for business purposes, it was to be expected that the sites should be utilised to their fullest extent. Narrow streets not only favoured protection, for the occupiers could easily combine in case of robberies, but the buyers were more satisfied when they saw a variety of goods within their reach. There were not only booths on the ground level but also below the ground, for cellars are not a modern invention. Business purposes in all ages appear to have been the first consideration with us in England, and the projecting upper storeys, which of late years are accepted as evidence of the old English love of the picturesque, may have arisen from the endeavour "to give shelter from the sun or rain to stalls and booths, and to goods displayed in the streets." In country houses their value must have been derived from other considerations.

The chimney affords an apt illustration of the evolutionary process. One which survived until a recent time in Oughtibridge Hall, Sheffield, exemplified the old arrangement by which it was placed in the middle of the living hall, and the stack was carried through upper rooms as if it were a prop instead of a weight. In the sixteenth century LELAND expressed surprise at seeing flues carried up along the side walls of a room instead of obstructing the central part. Prior to 1419 wooden chimneys were allowed to be erected in London; in that year there was a by-law issued prohibiting the use of any materials for them except stone, bricks or plaster.

Windows also reveal the influence of progress. In Old English a window was an "eye-hole," and that does not suggest a large area to admit light and air. According to Mr. ADDY, "as late as the sixteenth century glass windows did not pass to the heir as part of the freehold estate, but to the personal representatives. They consisted of a series of movable casements, which could be easily taken out." It would be interesting to have the opinions of lovers of the good old times when, the manufacture of glass having advanced, it became easy to have more glass than masonry or brickwork in the front of a house. They must have believed there was an end of English building.

The manor-house was almost like a farmhouse on a larger scale, and the plan prevailed to a late period. As Mr. ADDY says:—"We know from many extant examples of the sixteenth and seventeenth centuries that the typical country house of the larger and better kind consisted of a 'house place' or central room, with a large room on either side of it, entrance to the building being obtained by a central door opening into the 'house place.'" The examples which he describes, viz. Padley Hall, Derbyshire; a house at Charney Basset, Berkshire; Beaurepaire, near Durham, are in a condition which can reveal the general arrangement adopted for the accommodation of country gentlemen and their retainers.

The castles were suited to an age of marauders, and were places of refuge as well as strongholds for chiefs who were generally robbers, although they considered themselves to be models of honesty. They were among the first structures which succumbed as civilisation was developed. But it is overlooked that church towers occasionally served as substitutes for keeps. They were planned to resist attack, and they could be employed for watching. As the castles died out progress introduced municipal buildings, which represented entirely new theories of government. It seems incredible that the ancient representatives of our county, city, urban and parish councils were compelled to deliberate in the open air; sometimes they were obliged to use churchyards for halls. Necessity and the weather obliged them occasionally to have recourse to the parish churches, which in Wales were employed as law courts.

Mr. ADDY'S book, it will be seen, treats of many interesting topics, and it is creditable to him to have compressed so much information within the limited space assigned to him. The volume will compel many to take a new interest in houses, especially those which belonged to ancient days, for since individuality has asserted itself in buildings, as in many other forms, it is not so easy to point to instances of evolutionary power. Mr. ADDY it is evident has accumulated materials which would enable him to write a much larger volume, and we hope to see a further explanation of the theory in the series. What he has produced should be considered as an introduction to the histories of English domestic architecture.

GLASGOW ARCHITECTURAL ASSOCIATION

AT a meeting of the above Association held in the rooms 187 Pitt Street, on February 7, Mr. G. S. Hill in the chair, a paper was read by Mr. John Lochhead entitled "Shop Fronts." The essayist shortly described the shops of the seventeenth and eighteenth centuries, and quoted several enactments passed about those times regulating the projection of stall-board resulting in the flat bow window, which was still a common feature of English shops. With the introduction of plate-glass, the necessity for numerous astragals had been done away with, and with the possibilities of having large windows in single sheets the desires of tenants had increased, and shops to please them must have the whole front practically one sheet of glass. It was almost always the desire of the tenant of a corner site to carry his windows unbroken round the corner, and this caused a great loss of appearance to the whole building, as all idea of strength at the corner was gone when the corner butt was dispensed with. The system of recessing the shop front and carrying along a colonnade was good, as it afforded not only protection to the windows, but also to the public while examining the goods on view. The interesting series of shops called the "Row" at Chester was referred to, where the first floor was also devoted to shops, access being obtained by means of a gallery running along at that level. The essayist advocated that greater individuality should be given to shops occupied by tenants carrying on different trades, and showed by means of photos and sketches the different treatment which could be accorded with pleasing effect to provision shops, public-houses, &c. In this connection also a large number of drawings were shown, illustrating the treatment which the upper portion of a show window could have either by dividing the pane by vertical or radiating astragals or by the use of etched lines, &c., round the panes, as only a height of 7 to 8 feet was required for the showcase in the window. The treatment thus given did not detract from the showing of goods, while at the same time giving a pleasing effect to the whole window. At the close of his paper the meeting accorded a vote of thanks to Mr. Lochhead.

THE SENEFELDER CENTENARY EXHIBITION OF LITHOGRAPHS, 1898-99.*

THE circumstances which led to the organisation of the exhibition are pretty well known; but for the sake of the record it may be advisable to shortly recapitulate them.

It had been clearly shown that the year 1798 was that in which the invention should properly be ascribed, inasmuch as it saw the discovery of what Senefelder himself called "chemical printing," the essential principle of lithography. An early representation to this effect was made by Mr. Joseph Pennell who pointed out to the Society of Arts the importance of the opportunity and the advantages that might accrue to the art by a formal celebration and exhibition of work. The Society from the years 1818 and 1819, when medals were awarded to Senefelder and Hullmandel, one for his invention, the other for skill in the use of it, has taken a keen and practical interest in the subject. Its *Journals* contain many important communications and from time to time papers have been read before it and awards made for various improvements. The proposal was therefore welcomed, and a committee formed to carry it out, but after several meetings and the most careful consideration it was decided to seek for some means of making the exhibition more comprehensive than was possible with the immediate facilities at the Society's disposal. Ultimately it was suggested that the Department of Science and Art should carry out the scheme, and hold a loan exhibition in the South Kensington

* A paper by Mr. Edward F. Strange, read at a meeting of the Applied Art Section of the Society of Arts

Museum. This proposal was accepted by the Department in July last; a committee, including the whole of that formed by the Society, with some few additions, was called together, and the exhibition opened to the public on November 21, 1898. It will remain open till February 28 next.

The total number of exhibits exceeds 2,200, and on the whole the collection is very representative of the artistic and historical sides of the art; but it was not possible at so short a notice to provide space for the important technical and industrial interests involved. These might well prove a subject for a future exhibition, if it should be found possible to hold one.

On the present occasion I do not propose to enter into any systematic examination of the history of lithography. But the exhibition has afforded a means of making comparisons between the varying fortunes of the art; and perhaps of arriving at an estimate of the characteristics of successive phases, with more accuracy than has hitherto been possible. To this end I shall direct my endeavours in the hope that the suggestions I have to place before you may be found worth consideration, discussion and, if necessary, refutation.

There still exists, if the published criticisms on the exhibition may be trusted, a considerable amount of ignorance as to the so-called "Polyautography," a collection of which prints occupies the earliest place at the beginning of the British section. Within the last few days the prints have been said to "appear to have been produced from drawings made on paper, whilst Senefelder drew directly on the stone." (As we know, one of the first things Senefelder invented was a transfer paper.) The writer goes on to remark, sagely enough, "But it is worth noting they were all by the pen, and consequently we may suppose chalk or coloured drawings were beyond the power of polyautography, which apparently resembled some of the processes still employed in offices for manifold copies." Now a conclusion of this sort really seems to call for a precise statement of the circumstances, as far as they are known, under which this special and easily recognisable class of lithographs came to be produced.

Senefelder came to London in 1800. He stayed with his agent, Philip André, who, says he, "kept me in a perfect seclusion from society, for fear of losing the secret, for seven months, before even the first step towards obtaining our object was taken." He did succeed in getting his patent, No. 2518, dated June 20, 1801, and returned to Germany, having "sufficiently instructed" André. "I also," says he, "made some progress in the aqua-tinta manner, in which Mr. Gessner . . . an artist of talent, drew some pleasing landscapes." (These, by the way, I have not been able to trace.) "I am convinced," he proceeds, "that the public would have a greater number of masterly productions of the new art before them if it had been my fortune to fall in with an enterprising printseller, who employed proper artists and undertook interesting works."

It seems very much as if, for purposes of his own, André had misled Senefelder, for one can with difficulty otherwise explain this complaint in the face of the fact that on April 30, 1803, André published "Specimens of Polyautography, consisting of Impressions taken from Original Drawings made purposely for this Work." André heads his title, "By His Majesty's Royal Letters Patent," and styles himself "Patentee." But, as a fact, he never took out a patent for any process whatever, and his "specimens are ordinary lithographs in the "pen manner." Senefelder was clearly under the impression when he wrote his book in 1817-18 that he had not had a fair chance at the hands of British artists. But André's prints are by Stothard, West, Barry, Fuseli, Sir R. K. Porter, R. Corbould, T. Hearne, W. Delamotte, T. Barker and R. Cooper, and surely no more representative set of artists could have been got together at the time. The earliest of these is by West, and is dated 1801. He evidently gave the process a fair trial, for in 1802 he produced another in the chalk manner. From this date until 1811 a constant succession of dated prints has been found of similar character. Afterwards, only a few, until 1816, the period of the last in the style. Most of these are in the so-called "pen-manner," or in imitation of engravings, etchings or woodcuts, but in the exhibition will be found, in addition to the print by West already mentioned, Nos. 13 and 14, by H. B. Chalon (1804), No. 35, by Fuseli, and No. 46, by Varley (1811), all in the chalk manner; while several are entitled "printed from stone," and No. 28, "printed from a pen and ink drawing on stone"—evidence as to their nature which is too explicit to leave room for any doubt. There are also numerous references to the "Polyautographic Office," and Volnieler printed the illustrations to the frescoes of the Chapel of the Holy Trinity, Stratford-on-Avon, before April, 1807, in precisely the same manner—"from stone, at the Polyautographic Press."

The preface to Francis Moser's specimen book (1819) sufficiently explains the failure of polyautography, and, at the same time, identifies it beyond a doubt with lithography. It also confirms our impression as to André's treatment of Senefelder, whose very name Moser does not mention. He says:—"The unfavourable opinion of lithography which now prevails may be traced to the circumstances under which it was introduced into their country. When Mr. André came to England in 1803, many of the first artists in the kingdom practised lithography, but as the art of printing from stone was not then brought to perfection, the impressions obtained were few in number and not good." Also, lower down:—"Drawings may be made with ink or chalk. The latter is the best for use, but the more difficult to print." The specimens in the book are by Hullmandel, Blore, H. Corbould and G. Scharf, sen.

After Senefelder, it is most certainly to Charles Joseph Hullmandel that we must give credit for the propagation of lithography in this country. It was he who in 1819 gained the silver medal of the Society of Arts for the "best specimens of lithography executed on German stone," the work submitted including specimens of the various styles, and especially of the "imitations of acqua tinta." This latter method he afterwards developed into what he called lithotint—a process used with such fine effect by Prout, Hulme, Cattermole and Taylor. The patent (No. 8683) for this is dated November 5, 1840, and the title describes it as a "new effect of light and shadow, imitating a brush or stump drawing, or both combined, being an impression on paper from a prepared paper or stone, preparing the said plate or stone."

It is, I think, one of the sad conclusions forced on a visitor to the exhibition, that the beautiful process should have been allowed to die. With the exception of a single print by Mr. Frank Short, which is more nearly akin to mezzotint, I am not aware of any modern attempt at anything of the kind. It would be claiming too much to set it on a level with mezzotint at its best, but surely the examples shown display effects and capabilities worthy of any artist's attention. The technique does not seem to have been too laborious—it certainly cannot be compared in this respect with that of mezzotint—and it seems not unreasonable to expect that for certain classes of subjects it should prove to be absolutely the right tool to use. A well-known lithographer told me recently that he did not know of a single man who was now practising lithotint. Perhaps the advantages of distinguished isolation may induce some one to take it up.

In looking at the exhibition as a whole, one is bound to remark the curious manner in which the exhibits classify themselves. With the polyautographic prints we have already dealt, and I shall only supplement my earlier remarks by now pointing out that the device of enlisting the services of prominent artists in order to popularise lithography has been tried in this country on no less than three occasions, and that each time the results of their experiments are very nearly all that we could find to represent the nation during each specific period. The polyautographic prints form the first of these series. The second is due to the exertions of Mr. T. Way, who in 1871 induced E. J. Gregory, R.A., R. Thornwaite, F. R. Stocks, J. Parker, A. Morgan, Sir J. D. Linton, Joseph Knight, J. W. Buxton Knight, E. Hayes, Charles Green and J. W. Chapman to try the merits of drawing on stone. The results form the set published as "Hogarth Sketches;" but I think I am right in saying that the movement was not followed up. It is to a demonstration by Mr. T. R. Way, at the Art Workers' Guild in 1893, that is due the next effect to awaken interest in lithography. On this occasion transfer paper and chalk were served out to several of the members, and a practical proof given of the ease with which a print could be produced by this means. Consequently, on the approach of the Paris Exhibition of 1896, when it was found that unless something heroic was done, this country would be represented by only two or three names in the catalogue, Messrs. T. R. Way and Goulding again approached a number of prominent artists, and so secured a reasonable set of studies under circumstances of great difficulty. The work produced on this occasion was in many instances of such merit, and had the added advantage of being so easy for the artist, that many were induced to continue its practice both on the stone and on paper with results that are perhaps too recent for criticism. At all events, the revival in the eyes of the public became an accomplished fact, though it must not be forgotten that lithography has never been dead to the same extent as engraving on wood, and even more, on steel. It has been and is continually practised by hundreds of draughtsmen, thoroughly skilled in its technique, but whose business in life is to work for various industries rather than for art galleries or illustrated books. It is hardly likely that so large a body of craftsmen should not contain some artistic talent; and it is a matter for regret that, although the exhibition was widely announced both in the trade periodicals and all the other journals of importance, very few works were contributed to us from this source.

But to go back to the question of grouping. The first case is the set of lithographs executed for Baron Taylor's "Voyages Pittoresques." The early volumes are illustrated by Baron Atthalin, Fragonard, Isabey, Horace Vernet, Villeneuve and others; but very early in the series will be found examples of the work of Bonington, Prout, Louis Haghe, Boys and G. Barnard. We may claim that these stand out clearly from the

work of their French collaborators; but this may, none the less, have been due to the influence of the latter. And by way of Harding, Lane, Nash and their school it reacted on British lithography. However this may be, we have for our next group the productions of the famous circle of artists gathered together by Baron Taylor for his monumental work. Time is too short to do more than specify some of the other groups. In England we had the drawing-master type, perfect in technique from the mechanical point of view, but with little originality; and later on the group of portrait lithographers, Baugniet, Lynch, Maguire, Fairland, and Messrs. J. A. Vinter and J. R. Dicksee, who are still with us. Taylor, Cattermole and Hulme I have already dealt with. Louis Haghe and Nash are each at the head of small schools of disciples, and again their merits lie rather in the excellent reproduction of a drawing or true representation of an object, than in any exercise of imagination or design. In fact, this must be looked on as the prevailing characteristic of British lithography, and I am inclined to think that the influence of Baron Taylor's work was not too remotely responsible for it.

But in France the sharp changes of political fortune and general unrest of the nation have produced very different results. There is nothing in the history of the art to compare with the battle pieces and military episodes of Raffet and Horace Vernet, with the satires of Daumier and Vernier, the early artists of *Charivari*, with the often grotesque force of Delacroix and the keen and pathetic characterisation of Gavarni. Géricault, whose album was published in London in 1821, has occasionally received the credit of having inspired the outburst of lithographic work in this country which undoubtedly marked the years succeeding that date. But it will be difficult to trace his influence in contemporary British work. Isabey stands alone as a master of original landscape work, both in his surpassing technique and the beauty of the subjects selected by him.

Then comes another great group of workers, those associated with the publication, *L'Artiste*. Much of their work is limited to the reproduction of pictures; and they developed a close, highly-finished method which is not without a charm of its own, but cannot for a moment stand by the side of the great original painter-lithographers just mentioned.

In Holland we have the series of lithographs produced since 1840 for the *Kunst Kroniek*, on much the same lines, though I fancy it is hardly so well known. The work is not so good on the whole as that of the French series, though some of the plates issued in the Sixties have a distinct value.

Germany, the home of the art, has proved singularly barren, so far as its earlier lithographs are concerned. The reproductions of pictures in the great galleries, which engaged so many French and Spanish artists, were, perhaps, by none so well executed as by Piloty and Strixner, who were closely associated with Senefelder himself. It is perhaps a pity that the only work of the inventor in the exhibition should have been the specimen plates of his book, but a loan exhibition cannot command the public, and no examples were offered.

It will, I hope, have been seen then that while on the Continent lithography had the support or stimulus of a series of great undertakings or movements of national feeling, it never received any such in England. Lane was, indeed, an Associate of the Royal Academy, and Her Majesty the Queen, who is deeply interested in the art, has always supported it by the institution at court of the post of lithographer in ordinary, so long and honourably held by Mr. J. A. Vinter. The men who in the Sixties might have made a brave show with their own work instead of relying on the transcription of the wood-engraver, seem not to have tried it even in the least degree; and whatever reputation may be gained by British lithography—I speak for the present of the original work of artists only, and not of the excellence of British workmanship on the industrial side—lies in the hands of the artists of my own generation. Happily there are those who already give notable promise, and have even already achieved much.

But the questions still remain to be answered—Is artistic lithography alive again, what has it got to show, and what is it going to do? Well, more or less in this country there are perhaps half a dozen British and two American artists, Messrs. Shannon, T. R. Way, Rothenstein, C. J. Watson, Strang, McCulloch, Oliver Hall, Whistler and Pennell who practise the art in the proper sense of the word. And there are, perhaps, thirty or forty other artists who have tried their hands at it to the extent of from one to five or six prints. And that is all. But when we get across the Channel in France, Holland, Germany, we can number the new lithographers by the score. Fantin-Latour, whose splendid series is one of the remarkable features of the exhibition, and Menzel, who is by no means adequately represented, I do not include. But Willette, Carrière, Cheret, Blanche, Charpentier, Rivière, Dillon, Ten Cate, Havermann, Van Hoytema, Greiner, Burger, Orlik, Daur, Khnopf, Hans Thoma, Kampmann, Langhein—to name only a few—are all hard at work. And they are not content with the mere chalk sketch or even the more highly-finished drawing. Most of them are using colour, not, as w so finely done here in the early history of chromo-lithograp in the reproduction of oil or water-colour pictures, but as integral part of the design from the beginning. It is early to count results. With the exception of Whistler's well-kno experiments, I believe the device has never been tried befo And the specimens so far seen are calculated to provoke most varied criticism. But in some instances, I think it mu be conceded that the result is a technical success, and that ev the maddest or weakest productions may serve to show th there is a future for lithography in colour. But it must sta on its own merits, with all its limitations and advantages. T most fatal quality in lithography is the facility it affords imitating any other process of illustration on the face of t earth. And yet it is capable of individuality. The works Daumier and Gavarni, of Raffet, Menzel and Isabey ha proved that in the matter of black and white. It will have be the same in colour. If the limits imposed by the use of few tints only be frankly accepted and the convention of t picture adjusted to them, whether the result be a decorati panel like those of Rivière or an almost realistic landscape li the "Winter" of Baum, its success will depend on the arti The process is competent enough. I see no reason why t colour-print produced in this manner should not achieve t fine results of the woodcuts of Japan, and be as widely popul here as those beautiful prints were in their own country. does not follow that the subjects need be restricted to t acute symbolism of one school, or the slavish adherence another to alleged decoration. If British—and American—artis would give us just their own ideas with the added charm colour, I think they would find us appreciative. I am not skill enough in the technique of colour lithography to know how it is possible for transfer paper to be used in the production such prints as we are getting from Karlsruhe and Munich. do know that several of the artists at the former place a working lithographers in every sense of the word, and that pa of their employment is on what is rather invidiously known commercial work. But even if the paper be impossible, seems as if salvation might be found in the aluminium pla The colour-work of Thoma certainly indicates great po sibilities.

Within my limited space I have had necessarily to confi myself to a few phases only of the art. Its application industrial purposes is an enormous and most interesti question, including as it does not only that of the competiti of the photo processes, but also the assistance afforded by the to the further development and extended use of the lithograph stone. I have been compelled, as I say, to speak of lithograp as if the artistic side of it was the only one; but institutio whose scope and interests are as wide as those of both t Society of Arts and the Department to which I belong cou not confine themselves to so rigid if attractive a boundary, a I hope that the technical and industrial portions of the subje may shortly engage the attention of both bodies. As to artist lithography, the artists have its future in their own hand Perhaps I may be forgiven if I suggest that more of the should invest a little enterprise in a process which should no means be always identified with inferior or commonpla productions.

TESSERÆ.

Norman Construction.

THE skill of the Norman builders in the science of constru tion is attested by the strength and durability of the structures. The three essential ingredients of which they co posed their walls—squared stone, rubble and cement—wh combined could be equally relied upon for their firmne against pressure, or their resistance for a very long period the operations of time and weather. The system, therefore, bonding or tying together the ashlar-work on both sides of t wall was very rarely practised, and there is not an example it in a wall of great thickness. The practice would have be useless; solidity and capacity were indispensably requisite Norman construction, and the concrete was so dexterous composed that it would have derived no advantage from t introduction of blocks in a transverse direction. For the sam reason neither timber nor iron were concealed in walls th composed. The rugged, rock-like aspect of many buildin which once exhibited a well-wrought surface of stonewo mingled with the elegant ornaments of architecture proclai the toil with which their strength had been secured. Fountai Abbey and St. Pancras Priory at Lewes are interesting a deplorable examples; but in still stronger confirmation of t durability of ancient cement there are places in the walls Conway and Bamborough Castles where the stone has be forced from the mortar, which protrudes in large and promine masses, and which are not in any perceptible degree injured the weather. Another peculiarity occasionally observable

the construction of Norman masonry is that the angles of openings and the mouldings or piers composing the jambs attached to them are not bonded together, but that every member of the jamb throughout the thickness of the wall consists of distinct and similar layers of stone, which when not compactly joined and firmly sustained by cement become crippled by length of time, and fall asunder beneath the pressure of their arches. The tower of Canterbury Cathedral was a remarkable instance of this imperfect kind of construction.

Sir Charles Barry.

Barry was too little conscious of abstract principles or philosophic views to be willingly set up as an oracle of art. He was the last man to found a school of architecture or to enunciate sounding dogmas on the æsthetics of his profession. The whole bent of his mind was practical. The rules by which he worked were those of intuitive feeling rather than of an organic method of art. He probably never enunciated a theory in his life. We are not aware that he ever published a line. No one ever got him to open his mouth in a lecture or speech of a professional kind. It is by the buildings he reared that he will be known. And these are the embodiments of his moral nature no less than of his constructive skill. His simplicity of character is seen in the plainness and unity of his designs. His love of truth led to his horror of a sham window, a masked buttress, or an illusive façade. His courage, strength of will, and singleness of aim shine visibly in his resolute grappling with difficulties, and his quiet unflinching subordination of means to ends. The man and his work throughout are one—sound, genuine, practical, and instinct with truth. Charles Barry was one of those whose rise in life is the gradual result of sheer hard-working improvement of good inherent powers of mind and character. He owed nothing to advantages of birth, and but little to those of education. He was the fourth son of a London stationer of fair position and means. Neither in his home life, nor in the commonplace schools in which he was brought up, was there anything to foster high aspirations of any kind, or to lay the groundwork of artistic training in any sense. All he could get from the wholesome, though humdrum, atmosphere of home were habits of regularity, uprightness, and attention to business—qualities which would go far towards making up one side of his future professional character, while they would tend to supply a healthy corrective to what might otherwise have been an unreal and enthusiastic temperament. From school he carried away little beyond a superficial knowledge of English, a fair proficiency in arithmetic, and, at all events, a beautiful handwriting. His was by no means that heaven-born genius which takes the heavens of art by storm. He climbed to eminence by the steady conscientious culture of sound natural abilities. From the first his most strongly marked talent was for drawing, and the dull period of his "articles" was enlivened by the indulgence of a taste both for landscape and for caricature, as a kind of artistic by-play to the more prosaic work of surveying, valuing, and "taking quantities." He early strove, however, to soar above the semi-mechanical drudgery of the office.

Greek Measures of Length.

It is well known that the Aryan family possessed words for all numerals from one to a hundred before it was broken up into so many nationalities, before the Hindoos crossed into India, before Greeks and Romans had set foot on European soil. These numerals follow the decimal system, the oldest system both among Aryan and Semitic nations. It can also be proved by the evidence of language that, like the Hindus, the Greeks had formed certain technical terms to express certain measures of length, of space, and time, nay, even of weight, without borrowing from foreign sources. Though we do not know the exact measure of the Homeric pelethron, gues, pugon, doron, we know that they were intended to convey the idea of a definite magnitude. Pelethron or plethron, a measure of land, meant probably what can be ploughed in one day, being derived from the same root which yielded the Latin plaustrum and the Slavonic plug, from which the Germans, in turn, borrowed their word for plough. Gues, likewise a measure of land, seems connected with the old Ayran word for cow, the Sanskrit gô, and would have signified originally, like the Sanskrit gav-yûti, a meadow or pasture-ground for cattle, unless, like jugum and jugerum in Latin, it meant a piece of land that could be ploughed in one day by one ox, or, as in Latin, by one pair of oxen. The general meaning of pugon, too, is clear enough, whatever uncertainty may prevail as to its exact number of inches. Like ulna and ell, it meant originally elbow, and was probably intended for a foot and a half, or a measure of six hands, or twenty-four fingers. The Homeric doron meant most likely a hand, a hand given, and hence a measure of four fingers, just as in later times the Greek drachme, originally a handful, came to mean a certain weight, and afterwards a certain coin. The Greek pous (foot), palame and palaiste (palm), oregma (stride), require no more explanation than their English synonyms. All these words are so much direct evidence that the Greeks, before their contact with Semitic nations, were not such barbarians as not to be able to count, or to measure, or, if we consider the purely Greek word talanton (balance and pound), to weigh any article they wished to value or to exchange. But if we find such a word as mnâ, the Latin mina, without any etymology in Greek or Latin, signifying not a weight in general, but a weight sixty of which make a talent, then we have two definite problems before us. First, how did this Semitic word find its way into the Greek and Latin dictionaries? Secondly, why does a talent consist of the definite number of sixty minæ? If hereafter, and long hereafter, a scholar, say of the fiftieth century, were to find such names as centimètre or millimètre in fragments of newspapers dug up from the ruins of what once was London, he would be able to assert with perfect confidence that the English adopted their new system of measures from the French, and that the French system was formed on a decimal basis. The Greeks, using such a word as mnâ, must, directly or indirectly, have adopted the metric system of the Babylonians, and the Babylonian system must have been founded on a sexagesimal basis. These are two very important points, and they throw light on a distant period of history which almost escapes the vision of the ordinary historian. Here we see from incontrovertible evidence that the great empires of Mesopotamia, which almost bewilder us by their reality as we examine their ruins in the halls and the corridors, and, we are ashamed to add, in the cellars, of the British Museum, have left ruins of a different but no less startling character in the language, the civilisation, the literature of Greece. Here we are impressed with a lesson which it is as important to learn in the history of the world as in natura history—the lesson of that wonderful continuity which holds together everything that is, and everything that has been, whether it be the work of man or the work of nature.

Associations of London Streets.

If a man becomes conscious of the various bits of history which may be associated with the houses before which he daily passes, they tend to become rather more interesting to him than they were before, and there is a certain pleasure in trying to restore a picture of what a familiar place used to be in former times. Lord Macaulay's story about the gentleman who had shot snipe upon the fields which are now crossed by Regent Street is one of those picturesque touches which, whether authentic or not, enable us to realise a historical change more vividly, and it must have made Regent Street rather more interesting to a certain number of passengers for a few days. People, however, who make a collection of such associations ought to remember one or two things which they are very apt to forget. In the first place, it is very difficult to make a place historically interesting when there is nothing in its present aspect which enables us to recall the former state of things. If we examine a battle-field where the natural features of the ground have remained unaltered we can understand the battle better than we did before, and the place itself gains in interest. Marathon or Waterloo will always be worth a visit, in spite of the Cockney profanation of the last. But many places where remarkable things happened are exactly like places where they did not happen. A good many people have been put in the pillory or executed at Charing Cross, but the sight of Charing Cross does not help us to recollect the execution more vividly; on the contrary, cabs and omnibuses have a distinct tendency to call us back to the present. Now, a great many of the noteworthy places in London are remarkable for the precise reason that their present aspect is so very unlike the former aspect. The cicerone takes us to a street, and tells us that it is the very spot where something happened, only that everything about it is entirely changed, and we naturally feel that we would as soon have seen any other spot.

San Pietro, Pavia.

The basilica of San Pietro in Ciel d'Oro, at Pavia, is celebrated by Dante, Boccaccio, and Vasari. It took its name from the vault of the principal apse being gilded, after the fashion of the Byzantine artists. Its foundation is assigned by the chroniclers to the Lombard king Agilulph in 604. Liutprand, in the following century, is said to have employed in its decoration the skill of the numerous Byzantine artists who fled from the persecution of Leo the Isaurian during the rage of the Iconoclasts. No further historic record of it remains till the year 1132, when it was consecrated, and probably reconstructed, under Pope Innocent II. The interior has long been ruinous, through wilful destruction, though portions of the ancient beams of the ceiling still remain. The composition of the west front shows a marvellous combination of lightness with strength. An airy arcade in terra-cotta, broken here and there with stone and relieved with columns of marble, follows the slope of the roof, and is topped with a cornice of the same material; the space between being gracefully filled with interlaced semicircles springing from corbels. There are traces of a vestibule or narthex in the Greek fashion projecting from the face of the basilica.

NOTES AND COMMENTS.

THE late Mr. J. J. COLMAN aided most effectually in convincing amateurs of the importance of the Norwich School. He purchased examples at a liberal price, and he was willing to allow the public to enjoy them by lending his property to exhibitions. It was well known that he intended to enrich Norwich with some of the works he possessed, and the city has not been disappointed. His bequest is given in a characteristic manner. Mr. COLMAN did not wish to compel people to admire, as he had done, by bestowing the examples which he considered to be most suitable. He stipulated that the choice was to be made by Mr. JAMES REEVE, many of whose splendid drawings by COTMAN we have reproduced, and another representative of the Castle Museum. The value of the works to be taken was 5,000*l.*, reckoning by the sums for which they were insured and which are much below the present market prices. Mr. REEVE and his colleague have made the following selection:—Oil paintings.—(1) By JOHN CROME, commonly called "Old Crome," four paintings—"Yarmouth Jetty," "Back of New Mills," "Scene between Bruges and Ostend," and "Burdock." (2) By JOHN SELL COTMAN—"The Baggage Wagon," "Mishap," "Fishing Boats off Yarmouth," "Old Houses at Gorleston." (3) By JAMES STARK—"Wood Scene," "The Forest Oak," and "Small Landscape." (4) By GEORGE VINCENT—"Trowse Meadows." (5) By MILES E. COTMAN—"Boats on the Medway," and (6) by JOHN BERNEY CROME—"Burgh Castle." Three water-colour drawings by J. S. COTMAN, and one, of "The Devil's Tower, Norwich," by JOHN THIRTLE. A portrait of JOHN CROME, by OPIE, who in virtue of his second marriage was brought into intimate relations with Norwich and its artists, and a portrait of GEORGE VINCENT by J. CLOVER. There can be no question of the value of the gifts, but there is still room in the Castle Museum for many more examples of the Norwich school. We hope Mr. BULWER, Q.C., will be incited to rivalry by the bequest.

IT is strange to see the French Government taking up the business of picture-dealing. Hitherto a multitude of pictures, old and new, were purchased for the public galleries. Now there is to be a little variation of the monotony, for there is to be a sale of paintings. The first experiment is to be on a small scale, for only three works have been selected for disposal. One is a landscape, which is attributed to CLAUDE. The second is a *Joseph and Potiphar's Wife*, which is supposed to be the work of some Dutch artist. The third is a portrait of a child, and is put forth as an English work. How the three works found their way to the national Pantechnicon there is no State paper to explain, and we suppose they are not of sufficient merit to serve in any of the remote provincial galleries. In London they would be frankly described as speculative lots, and on a Friday night in the "Slaughter House" they would be knocked down for a modest sum. But the officials expect the State will be enriched to the extent of 60,000 francs by parting with them, and the money will no doubt be applied towards the cost of submarine torpedo boats for blowing up all England.

THERE are a great many rival methods for measuring earthwork, but the most elaborate is that of Sir JOHN MACNEILL, which is worked out so as to form a large volume of tables, which are easily employed. The basis is the prismoidal formula, which is as applicable to the simplest computations for solids as the triangle is for superficial measurement. The formula may be considered as an universal one, and it is, therefore, hardly surprising to find the Supreme Court of California employing it before giving a judgment. The circumstances were curious. Everyone knows that in railway works cuttings and embankments should balance as nearly as possible, otherwise land for "spoil" has to be obtained. But if a certain quantity of earth is excavated it will not necessarily form an embankment of similar cubical capacity. The plaintiff (Mr. SCANLAN) had contracted with the San Francisco and San Joaquin Railway Company. It was arranged that the earthwork was to be measured in the embankments and not in the cuttings. One of the plaintiff's witnesses said he had calculated a trial embankment from cross sections, an adopted an average area. The engineer's calculation showed a lesser quantity. The judges decided to adop neither, but to make their own calculations by adoptin the prismoidal formula as a basis. The judges con sidered that the plaintiff was claiming for an excess o earth in the banks which had been laid on to meet th inevitable shrinkage. But the contract deed said that "n measurement will be made of the material added fo shrinkage nor payment made for the same." It was sai that if the section by the railway company's enginee showed the extra earth it should have been corrected befor the work was commenced. The Court therefore said tha if there was another trial both sides were to put in th measurements as evidence, and then errors in computatio could be corrected by the Court itself. Judgment wa given for the defendants. It certainly is risky for judges t take out quantities, and it appears to us there is as muc vagueness in their calculations as in those of the litigants The fairest way is to pay for excavations and to leave margin if embankments are unusually disproportionate t the cuttings.

IT was arranged at one time that the Pavillon d Flore, which has survived the destruction of the Tuileries was to be prepared for the reception of any royalty wh visited Paris in 1900. The building was latterly occupie by the Colonial Minister, and he has received an order o eviction. It is uncertain whether the building is to b used as a continuation of the Louvre, or as a roya caravanserie. The inmates would be the guests of th State. The Paris municipality also considers it is incumben to show hospitality, and the Château de Bagatelle in th Bois de Boulogne has been considered as a suitable buildin for the guests. Originally it was of modest size, and was erecte in the last century for Mlle. DE CHAROLOIS, a daughter of th third Prince DE CONDÉ. Afterwards it passed into th possession of the Comte D'ARTOIS, the brother of LOUI XVI., by whom it was greatly enlarged. He had made bet with MARIE ANTOINETTE that he would have the ne building constructed in a month. He gained, but he ha to pay 600,000 livres for the expeditious work. The plac was used as a restaurant during the Revolution. CHARLES X (who had erected it), when he came to the throne, resume possession of it, and passed it to the Duc DE BERRY. Th Marquis of HERTFORD purchased it, and it was among th property inherited by Sir RICHARD WALLACE. The châtea appears to be fated to have a variety of tenants, and there fore it would be suitable for the use contemplated by th Municipal Council.

THE Calendar, History, &c., of the Science and A Department for 1899 has not much that is new to relat about that decadent institution. Although there is n director for art and no official examiner the cumbrou machine revolves. The question must arise how man more of the highly paid offices could remain vacant withou any loss following to science or to art? Nobody can doub the distribution of enormous sums—last year the residu derived under the Local Taxation Act alone was 875,000*l.*— but the advantages to the public are not commensurate t the outlay. Even lethargic London has been compelled t think of imitating Birmingham, Manchester, Nottingha and other provincial places in order to escape the fruitles waste of money on officials of all grades. Another indica tion of the public feeling is to be found in the surprisin decline of gifts to the South Kensington Museum. Thos of last year consisted of a plate and proof by the "Printsellers Association," an old English dresser with pewter plates an dishes, and a water-colour drawing. Unless there is change, it will be a long time before the museum is enriche with another million's worth of treasures, that is if th presents come in so slowly, and are to consist mainly o plates.

DURHAM CATHEDRAL.

THE plan of Durham Cathedral shows a nave and choir which more nearly correspond in length than is usual in several of the English cathedrals. The choir needed a large area, for attached to the cathedral was one of the most important of Benedictine monasteries. As we have already related, the secular priests who were attached to Durham Cathedral, and who appear to have enjoyed a comfortable life, were removed by the Norman bishop, WILLIAM OF ST. CARILEF. He was originally a monk, who rose to the abbacy in Normandy, and, like many of the clerics of that time, was remarkable for energy. His predecessor, WALCHER, who was murdered at Gateshead, had resolved to bring monks from Jarrow and Wearmouth to Durham, but the reform was accomplished by WILLIAM OF ST. CARILEF. The arrangements appear to have been concluded prior to the removal of ALDWIN'S church in 1092.

In the history of the cathedral the priors of the monastery are often mentioned. It was understood in CARILEF'S time that the bishops were to find the money for the cathedral, and the monks for the monastery buildings. After the bishop's death, which occurred at the end of 1095, a great part of the cathedral funds was supplied by them. About 1140 Bishop GEOFFREY died, and CUMIN, the Scottish chancellor, seized the bishopric. The prior escaped to York, and there he was consecrated Bishop of Durham. CUMIN, however, contrived to retain his hold with the aid of his retainers for over a year. It was not surprising that when one prior was able to preside over the diocese, another should wish to succeed him. That was Prior LAURENCE, who wrote poetry. He was disappointed, for HUGH PUDSEY, a young priest who was treasurer at York, was appointed to the see. The two were reconciled, and filled their offices without any collision. After LAURENCE'S death the relations between PUDSEY and the monastery were not always peaceful. It was to Bishop PUDSEY Durham was indebted for the Galilee, but with what intention he erected so novel an appendage is not to be discovered. He was one of the magnificent prelates that were not uncommon in that period. He was apparently of Norman extraction, and possessed the support of King STEPHEN and his court. PUDSEY could therefore act as a despotic prince whenever it pleased him to do so. He sided with HENRY II. against BECKET, and when the king contemplated taking a share in the crusade the Bishop of Durham was to be one of the party, and not one of the nobles went to war in a more costly style. Afterwards PUDSEY by purchase became Earl of Northumberland. In his last days he endeavoured to make amends to the monks for his high-handed proceedings towards them.

Some of his successors imitated the earlier rather than the later days of PUDSEY, and the monastery fared badly with them. It was to be expected that whenever an opportunity arose the monks exhibited opposition to the bishops, and they could not be blamed. But when that great lover of architecture, RICHARD THE POOR, whose name will always be associated with Salisbury Cathedral, was elected to Durham the monks became his most loyal supporters. THOMAS DE MELSAMBY was then their prior, and he also was an enthusiast for the new Gothic. Between them they planned the beautiful chapel at the east end, known as the Nine Altars, which, in spite of JAMES WYATT'S vandalism, is still one of the glories of the cathedral. MELSAMBY should have succeeded his brother architect, who died in 1237, but King HENRY III. was obdurate, and the royal physician, who was Bishop of COVENTRY, succeeded.

The monks had one advantage in any disputes between them and the episcopal rulers. They could claim to be the representatives of the brethren who fled from Chester-le-Street when the Danes invaded the district, and who found a refuge for the body of ST. CUTHBERT in Dunholme, or Durham. The incident by which they were assured they had reached the place which was revealed to EADMER the monk was carved in a relief on the building. What arrangement was adopted for the original composition must be left to imagination, but the treatment of the relief which existed a century ago can be judged from the following description by JOHN CARTER :—

> St. Cuthbert's body being in danger of defilement by barbarians, the religious of the monastery in Holy Island, where it then was deposited, bore the body away in hopes of finding a more peaceful resting-place. After various adventures, perils and visions, they arrived at the site where Durham now stands, then a rude, uncultivated wild; when, hearing a maiden, who was in quest of a strayed cow, receive information that she was in Dunholme or Durham (which place they knew by revelation they were to fix on as a terminating point to all their trouble) they rejoiced at the heavenly sound, understanding thereby their toils were at an end. They resolved, therefore, to remain in the propitious region, and to build a fane in honour of their saint, whose bones might henceforth repose in hallowed aisles and calm security. The basso-relievo has been resculptured, where we find the late religious therein metamorphosed (agreeably to modern truth of ideas) into a classic Grecian or Roman senator, who with long, flowing hair, toga nicely folded (and, by-the-by, a London Bluecoat boy's cap in his hand), paying court to the fair dairymaid dizened out like to a celebrated toast of the present milky train in this fair city of Durham.

The relief which is now to be seen does not correspond with that described by CARTER, and might have been modelled after a group of milkmaids in Derby or Chelsea porcelain. But it is of interest, as it helps to carry on a tradition which Mediæval sculptors were glad to utilise. If at Laon the oxen who dragged the stone have their memorial, the strayed cow that was an agent in the founding of Durham Cathedral and the creation of its palatines was at least entitled to similar recognition. Rightly or wrongly, one of the first objects sought out by American visitors is the cow, and we suppose it will always continue to be an object of attraction.

Another object which rivals the "Dun Cow" in popularity and with more reason is the "Sanctuary Ring," which appears in one of the illustrations. It is a memorial of a time when the power of ecclesiasticism was feared by the strongest and greatest. MACAULAY, who would have Parliament supreme, admitted that "in times when life and when females were exposed to daily risk from tyrants and marauders, it was better that the precincts of a shrine should be regarded with an irrational awe than that there should be no refuge inaccessible to cruelty and licentiousness." But in a later age the Durham memorial was not always respected. In JOHN CARTER'S time the ring was on certain days stuck with candles by way of ridiculing the warning which was expressed by the terrific face. But happily more respect for antiquity is shown in our time, and, apart from its historic interest, the Sanctuary Ring merits to be valued on account of the skill of its unknown creator.

That any example of antiquity is found at Durham ma be considered as almost providential. There was n English building in which renovation appeared to be d stined to run to such extremes as in Durham Cathedra Bishop SHUTE BARRINGTON, who was transferred fro Llandaff in 1797, was most liberal in expending money, an when he called in JAMES WYATT he was prepared to dispens large sums in bringing the cathedral into a state whic would please the arbiters of taste. With so munificent client WYATT was ready to surpass his previous operation He wished to destroy the Galilee in order to form a carriag approach to the principal entrance, and the Chapel the Nine Altars to extend the choir. But the spirit opposition, which was a characteristic of the ancie priors, had descended to the Dean and Chapter, and their exertions the re-creative ambition of WYATT w checked.

DURHAM CATHEDRAL: THE DUN COW.

SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

By the Author of "Ecclesiologia Germanica," &c.

(*Continued from page* 84.)

XII.

Pontigny—Auxerre.

THURSDAY, August 4, 1892, is a day ever to be remembered, for on it I make my long-looked-forward-to visit to the celebrated abbey of Pontigny.

The morning is most glorious, and after "assisting at" one of the early Masses in the great church of St. Florentin, notes upon which I defer for the present, I make a good breakfast, and, leaving superfluous baggage to be called for on my return, start on my Pontigny pilgrimage. "The omnibus of one o'clock," as Madame terms it, being about to start for the station, I again avail myself of its services, and so get over the dusty and somewhat uninteresting bit of road between the town and the station very agreeably. Equipped in flannels and a straw hat, knapsack on back, and stout stick in hand, I branch off on the road to Auxerre, and after a most enjoyable walk of about an hour and a half—meeting no one but a peasant or two, who gives me a cheery "Bonjour"—come in sight of the long red-tiled roof belonging to the great Cistercian church of Pontigny, which still remains to testify to the severity of taste with which St. Bernard inspired the order. Built in the very simplest Lancet style, the abbey church of Pontigny embraces a nave and apsidal choir under one continuous roof, both aisled; the latter with an outer aisle, forming, internally, a series of chapels; transepts roofed at a lower level, and a lean-to western narthex, like that at Maulbronn, a typical German church, built for the same order. The fittings of the choir, the high altar, and the shrine of St Edmund date from the beginning of the eighteenth century, otherwise the church remains in the same state as when Becket received in it the monastic habit at the hands of Guickard, the second abbot A.D. 1164. Externally, this church presents an almost barn-like simplicity, from its long unbroken line of roof, absence of towers or pinnacles, plain Lancet windows, and no ornaments of any sort. If I mistake not it has, in some details, served as a model to several of the ablest architects of the Anglo-Catholic revival—notably, Brooks in his fine but as yet unfinished Church of the Ascension, Lavender Hill; Burges, at St. Faith, Stoke Newington; and Pearson, at St. Michael and All Angels, Croydon, the last-named example bearing a most striking resemblance to Pontigny, with its Lancet-lighted apse, vaulted in such a manner as to produce the most enchanting play of light and shade, and showing how much effect can be obtained with the smallest possible amount of elaborate detail.

Pontigny Abbey Church has great claims upon the veneration of English Churchmen. The remembrance of Thomas à Becket—who, according to the legend, while in prayer here before one of the altars had a Divine vision, accompanied by the words, "Thomas, Thomas, my Church shall be glorified by thy blood"—is not the only link between Canterbury and Pontigny. Two other of our archbishops found shelter here, and one of them still lies in the church. Stephen Langton, with some of the Chapter of Canterbury, took refuge here from the tyranny of King John in 1207, and, if the tradition be correct which assigns to Langton the existing division of our Bible into chapters and verses, Pontigny was most probably the scene of his labours in this respect. But the crowning glory of this religious house is the shelter it gave to Edmund, Archbishop of Canterbury, who with St. Richard his chancellor, despairing of the condition of England and of her Church, which was completely (A.D. 1240) in the hands of foreigners, voluntarily exiled himself, and in November of the same year died here, enfeebled, it is said, by excessive abstinence. The remains of St. Edmund, now and for centuries the object of great reverence at Pontigny, still exist here in the "chasse" behind the high altar,* having for a wonder escaped the devastations of the Huguenots who burnt the church in 1567, and also the blind fury of the Revolutionists.

Shorn of its endowments, and the sole remains of a once large conventual establishment, the abbey of Pontigny is now but the parish church of a humble village. About forty years ago subscriptions were opened for its restoration, and it is pleasing to observe that the Ecclesiological Society, confessing that differences of time and differences of opinion were no reason for a nation to neglect its historical celebrities, took the matter up most earnestly, and on this account we English Churchmen should have a special interest in the grand old Cistercian abbey of Pontigny, which sheltered three such illustrious prelates. Some remains of the conventual buildings have been fitted up for the residence of the ten clergy who form "a congregation of St. Edmund"—"Pères de St. Edmé," they call themselves—and who possess curious deeds and letters relating to St. Edmund (1243), Robert Grostête, Oxford University, Merton Abbey, &c.

Pontigny: West Front of the Abbey.

An avenue of trees leads up to the western door of the abbey, with its lean-to porch. The nave is destitute of furniture, with the exception of a fine stone screen in the Italian style, just above the west door, and supporting a noble-looking organ, whose brightly burnished pipes, as well as of those of the choir organ in front, stand out in wondrous relief from the rich case. The two easternmost bays of the nave are occupied by the *chorus cantorum* with its finely carved stalls of early eighteenth-century date returned at the west end, where the view is closed by a high and close but somewhat poor screen of sham materials surmounted by a crucifix. Above the stalls on either side two large pictures conceal the arcades. Iron grilles are

* The remains of St. Edmund were the object of a so-called "pilgrimage" undertaken in 1874 by the Roman Catholics of England.

carried across the arches opening into the transepts, as well as between the arcades of the eastern limb and of the apse, where the pillars, with their capitals somewhat rudely chiselled in Early Burgundian Pointed, are isolated, and sustain nine narrow pointed arches, the centremost being blocked by the "chasse" or reliquary containing the remains of St. Edmund. There is no triforium arcade. The absence of this feature, the whiteness of the restored stone, and the plain glass which fills the windows of the apse clerestory impart an air of great simplicity and sternness, the predominating attributes of a Cistercian building. I notice that the chapels opening out of the circumambient aisle have a stone altar apiece, but very sparely furnished. In the choir stalls I sit awhile. Such is the awful stillness of the place, broken occasionally by such country sounds as the crowing of cocks and the clucking of hens in the farm buildings outside the church, as the summer breeze wafts them through the open windows in the transepts, that "I have an exposition of sleep come upon me." Softly be it spoken, I sink into a gentle doze, from which I am only awakened at twelve o'clock by the deep-toned Angelus booming along the roof, upon which I pull myself together, and, desirous of procuring a few souvenirs of my visit in the shape of photographs, repair to the domestic buildings attached to the church. I

PONTIGNY: CHOIR OF THE ABBEY LOOKING EAST.

ring the bell of the Conciergerie and state my errand. "The Fathers are at déjeuner." Clearly they are, from the clatter of knives, forks, and spoons, and the rattling of crockery-ware which fall upon the ears. "Will monsieur have the extreme great goodness to call again in half an hour?" "With all the pleasure in life," is the reply. So I repair to the somewhat humble inn where I have left my knapsack, and am presently in the enjoyment of a simple meal of bread, cheese, and butter, and hard-boiled eggs, washed down by a little Burgundy, chatting meanwhile with the hostess, who stands transfixed with astonishment when I tell her that I am walking to Auxerre.

Photographs purchased in the clean parlour of the Conciergerie, off whose floor, as Miss Tox would have said, "You could eat your dinner"; a short gossip with one of the "Fathers of St. Edmé," an affable person, who shakes hands and wishes me "bon voyage" in the most pleasant manner; a cup of tea at the inn, which mine hostess has all ready for me; a strapping-on of knapsack, and I am on the road to Auxerre, casting many an admiring look back at that simple old Cistercian church, nestling in a valley standing "thick with corn" just below me. Five miles further on I reac Montigny le Roi, another small scattered village, in whos Early Pointed one-aisled church—enshrining remains of th earlier building in the shape of rich Romanesque doors an sedilia—I rest for a short time. Anon, the road—neve fatiguing, because so diversified—leads me through large vin yards, without, however, the picturesqueness of a Kentish ho garden—and at about half-past four, on arriving at the brow the last hill, I come once more in sight of my old friend th Yonne, and a little to the left—crowning the slope on i opposite bank, still two miles distant—Auxerre.

Whether approached by road or rail, Auxerre is decided prepossessing, and at first sight reminds me of that Norma city—Coutances—with its cathedral rising between the tw great churches. The Burgundian city, however, has a decide advantage over the Norman one, since it is fortunate in th possession of a fine river—the Yonne—very broad here, an crossed by two substantial bridges.

It is getting on for six o'clock when I arrive at the Pont d Sud. Standing upon it for some moments before wending m way up the steep streets, I am rapt in admiration of the pi turesque scene before me, all steeped in the golden afternoo sunlight. Bordering the river is a pleasant shady boulevar

AUXERRE: THE LADY CHAPEL.

then come the irregular houses overtopping one another, a dominating all the glorious cathedral, built of a warm taw stone. A little to the north lies the church of St. Germain, wi its lofty apsidal choir, transepts, truncated nave and isolat Early Pointed spire. Both churches promise a rare archite tural treat. Somewhat fatigued, I at once seek the Hôtel l'Epée, pleasantly situated in the bustling main street, a which I can heartily recommend. After some ablutio dinner is served, and, it is needless to say, has ample justi done to it. By the time the meal concludes the cathedr is shut for the night, so I am obliged to be content with stroll about its precincts, whose charming peace and seclusi suggest an English cathedral city. The cathedrals a churches hereabouts appear to be closed at seven o'clock. the more northern districts, and especially in Normandy, th are kept open to a much later hour; indeed, I have recolle tions of sauntering round the dusky aisles and choir chapels St. Jacques and St. Remi at Dieppe, the various Caen church and the cathedrals of Bayeux and Coutances as late as ni o'clock, and remember distinctly how very awful the voice

ıe custodian calling "On ferme l'église" sounded once in ouen Cathedral, when paying a late visit to that superb lifice—one, by the way, whose value and beauty is not ıfficiently appreciated by the large number of our compatriots ho visit Rouen, probably in their anxiety to see St. Ouen, a ructure which, while exhibiting Pointed architecture in its oblest form, and as illustrating the period when it had attained s acme before passing into the Flamboyant, has been elevated y a strong popular delusion into the great attraction of the ty.

To return to Auxerre, about whose quaint hilly streets it is xtremely enjoyable to dawdle in the sweet morning air. It is arket day here, and as early as six o'clock carts of every escription, each accompanied by its dog, are rattling over the ony streets of the city, towards the large covered "Halles," den with country produce. I enjoy the bustling scene around, ıd above all the sight of the grand old tawny-coloured juare north-west tower of the cathedral rising up into the ear blue sky above the houses. Viewed from the market, where e Burgundy peasant women, in their cleanest and freshest owns and white caps, are arranging their wares, and chattering cessantly, it forms a noble object. A charming sight is a ntinental market.

The cathedral of St. Etienne at Auxerre * is glorious. How orious I knew not until I had examined it. The mighty bric itself, the western and transept porches, which seem to vite a world to enter, the great sweeps of jewelled glass, the eople, too, using their church as it had always been meant to e used—coming in with their baskets, &c, at one transept oor, kneeling for a few moments before the high altar, and assing out at the other; all this strikes the imagination most vidly and ineffaceably. The nave arcades remind me of me of our English examples, the arch mouldings springing om slender attached shafts, as at Chester, only much loftier. urmounting the arcade is a triforium, like Worcester, and ove, again, a lofty clerestory of four-light Middle Pointed indows, many of which glow with old painted glass. A finely oined roof covers the nave, colour being applied to the bosses ıd to a small portion of the ribs radiating from these bosses ith excellent effect. There is some splendid early Middle ointed detail at the west end of the north aisle, just under the reat tower; while the chapels opening out of the aisles north ıd south are in several instances finely restored specimens of ıe same style. Others have been sadly tampered with by ebased Gothicists. Two windows in the northern range of hapels strike me as particularly good examples of modern rench painted glass. Mural painting is represented in these hapels by some very vivid frescoes of full-length bishops, dis-overed evidently during the restoration of the fabric. One of ıe chapels in the south aisle of the nave is dedicated to St. ermain, the patron saint of the diocese, who, with St. Loup, id Britain of Pelagianism. His statue surmounts the altar, ınd in the hand is placed a bunch of grapes, doubtless the first-ruits of the vintage.

Standing under the crossing, the views presented by the nterior of Auxerre Cathedral are enchanting in the extreme. Behind is the dusky Middle Pointed nave, with its light elegant rcades; right and left extend the short transepts, each having n its principal face a glorious Flamboyant rose. On all four ides, springing from huge clusters of tall slender shafts, are he arches spanning the entrance to nave, choir and transept. n front is the exquisite choir, which in purity of First Pointed Gothic rivals Coutances. Some of the piers are cylindrical, thers are composed of several small shafts, but all have most elicately foliaged capitals. Much of the detail here was re-roduced in our churches by the late Sir G. Gilbert Scott in he works entrusted to him about five-and-thirty years ago, otably in the large parish church of St. Mary, Stoke New-ıgton—a *chef d'œuvre*, and exhibiting, in a very marked degree, he love of foreign Gothic forms which had so strongly taken ossession of its author's mind at the period of its erection—855-58.

The exquisite early thirteenth-century choir of St. Etienne, hich it is a privilege to have seen and a duty to study, was begun by Auxerre's fifty-eighth bishop, Guillaume de Seignelay, eight years after his accession to the see, in 1207, and is therefore contemporary with those of Tours, Chartres, Soissons, Rouen, Troyes, Angers, Rheims, Beauvais, and a host of other examples, which combine truly to render the period comprised between 1215 and 1250 the Augustan age of French architecture. This prelate, as M. l'Abbé Lebeuf tells us in his "Histoire Ecclésiastique d'Auxerre," vol. i. pp. 339-360, "voyant que de tous côtés on rebâtissait les Eglises Cathédrales, il ménagea une somme d'argent pour rebâtir la sienne qui menaçait ruine en quelques endroits. Il fit commencer à détruire l'ancienne, du côté de l'Orient, l'an 1215. . . . On vit avancer considérablement dans l'espace d'un an l'ouvrage de la nouvelle cathédrale."

The triforium in the choir of Auxerre Cathedral has four simple Lancet arcades on slender detached shafts, and the wall, in true Burgundian fashion, not being pierced, an effect of great solidity is obtained. Above this rises a lofty clerestory, one large plate-traceried window of two lights, with a plain circle in the head, serving for each bay. In the apse these circles are cusped, but in a very curious and not altogether pleasing fashion, as my readers will see if they turn to their Parker's "Introductions," and open them on page 242 of his chapter on Continental Gothic.

AUXERRE: THE CHOIR FROM SOUTH TRANSEPT.

Pen fails to describe the priceless glass which fills all these great Early Pointed choir windows at Auxerre. Much of it is due to Bishop Henri de Villeneuve. He succeeded Guillaume de Seignelay in the see of Auxerre in 1220, and dying January 18, 1234, was the first prelate to find a resting-place in this magnificently reconstructed choir.

To quote once more from L'Abbé Lebeuf's work:—"Quand l'auteur de l'abrégé de sa vie ne dirait pas qu'il enrichit l'Eglise de Saint-Etienne par ses dons et ses bienfaits, les vitrages du Chœur parlent encore en sa faveur. On voit au haut de la grande vitre du fond de l'abside, la figure d'un Agnus Dei, avec un étendard, qui est la représentation même du revers de son sceau ou du contrescel, ainsi qu'elle se voit dans les actes de son temps avec ces mots '*secretum Episcopi.*' Il eut si à cœur l'avancement de l'édifice qu'il impétra que tous ceux qui contribueraient à son avancement seraient participans de tous les biens spirituels du Diocèse." In the sinister light

* Although a cathedral in name, St. Etienne has no collegiate establishment. The bishopric was suppressed in 1801 and united with ens.

of the central window of the apse is the Crucifixion; in the dexter light, the "Majesty," with a kneeling bishop beneath His feet. The early morning sun is streaming gloriously through this window, staining the floor of the choir with colour.

The separation between nave and choir is effected by a lofty eighteenth-century iron screen and gate, surmounted by a crucifix, so that from the great west doors an uninterrupted view is obtained to the very penetralia of the lady chapel.

The cathedral of Auxerre possesses two organs, the great one occupying a somewhat anomalous position in the south-west angle of the south transept. For the benefit of those who are unacquainted with the working of a great Continental church, it may be interesting to state that in nearly every town church there are two organs—a large one for the voluntaries and *sorties*; for the interludes played between the Psalms, verses of the Gospel Canticles, and office hymns; and for processions; another in the choir to accompany the plain chant. The usual place for the great organ is at the west end, as at Dieppe, Rouen (Cathedral, St. Ouen and St. Maclou), Amiens, Paris, Troyes, Coutances and Bayeux; and in most instances the cases are very richly carved. In several great churches, however, it is to be found nearer the choir, as at Eu, Laon, Tours and Rheims, where it occupies the transept; Chartres, Metz and Strasburg, where it hangs above the nave arches with grand effect; and Bruges, where it stands upon the choir screen in a very dignified and English fashion. The great Dom at Cologne possesses but one organ, and that is in the north transept. I have most pleasing recollections of the offices at Cologne, which are sung daily *in choro*. It was a glorious August afternoon and the hour of prayer when I entered this the most stupendous Gothic church in Christendom for the first time. Compline was just concluding, and I shall never forget the sonorous voices of the canons and cantors as they rose to the vaulted roof of the choir in the *Nunc Dimittis* and *Salva nos, Domine, vigilantes*. I remember the great bell, for some reason or other, was booming at the same time, and its continuous tone, heard on the pavement of the cathedral, resembled a gigantic bass diapason pipe, accompanying the plain chant.

But I am forgetting Auxerre. From the transept I pass into the choir aisles, which, like those at Sens, are destitute of side chapels. The Early Pointed French work here is unusually fine. Several of the large plain lancet windows glow with magnificent old glass; and a door pierced in an exquisitely arcaded wall, just to the left on entering the north aisle, admits to the sacristy, a spacious vaulted chamber, where copes are hanging up, and vestments for the day lie spread upon the table. Perhaps the gem of Auxerre Cathedral is its chapel, dedicated to her

> Whose name
> All but adoring love may claim.

Square-ended, but vaulted in such a manner as to give it an apsidal appearance, it is entered from the procession path behind the high altar by three stilted arches springing from shafts. "Nothing," says one of our most judicious architectural critics, "can be more elegant than the junction of the lady-chapel with the chevet; for, though this is almost always pleasingly arranged, the design has been unusually successful in this instance. The two slender shafts just suffice to give it pre-eminence and dignity without introducing any feature so large as to disturb the harmony of the whole." The morning sun pouring through the glorious old glass in the eastern triplet of lancets in this lady-chapel of Auxerre was a sight never to be forgotten.

(To be continued.)

BIRMINGHAM SCHOOL OF ART.

ON Friday in last week Sir William B. Richmond, R.A., distributed the prizes gained by the students at the Birmingham Municipal School of Art. In addition to the students, says the *Birmingham Post*, were about 500 teachers of art subjects in different schools of the city, and a large number of manufacturers and handicraftsmen connected with local industries, no fewer than a thousand tickets of admission having been applied for by these.

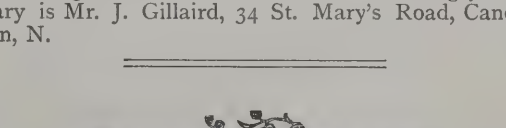
The Lord Mayor, after a few congratulatory words on the size and composition of the audience, read a letter addressed to him by Mr. George Frampton, A.R.A., in response to a invitation to be present. Mr. Frampton expressed regret tha his other engagements prevented his acceptance of the invita tion, and said, "It pleases me, my lord, to take this opportunit of congratulating you, as well as the city of Birmingham, o the unique achievement of your school under the able guidanc of Mr. Taylor. It is a school that has done more for th decorative arts than any other in the country, and those wh have studied there have turned out to be some of the mos serious workers of my acquaintance in the art world." Accep ing those complimentary words as not without their substratur of truth, they might feel, the Lord Mayor went on to say, tha they had begun to climb the ladder which they had set them selves to ascend, and how far they succeeded depended, a they knew, as much upon the city of Birmingham as it di upon the students of the school. He did not think the com mittee should want a better assurance that their work wa being appreciated than the fact that a thousand manufacturer and their foremen had applied for tickets.

Sir William Blake Richmond said that he had received th hospitality of the city on many occasions, and it was a lon time ago since he first visited Birmingham to address th students at the Midland Institute. That was before the splendid art school was built, and he remembered he took grea pains to write a kind of historical treatise upon the developmen of art all over the world. They listened to him with grea attention, and at the suggestion of Mr. Kenrick when he replie to the vote of thanks he referred to the students' work in th schools with a good deal of praise and also some blame. The took what he said very kindly, and that encouraged him tha night not to make a formal address, but to meet them upon common ground as one student talking to another. He ha watched with great interest the progress of the Birminghar school, and he did not think what they had heard from M Frampton was in the least degree exaggerated. He knew tha they had passed through many difficulties to establish them selves upon a firm footing, and that firm footing wa in a large degree due to their headmaster. The art of England of late had been in great trouble by th loss of some of their great leaders. He referred primaril to the loss by death of Lord Leighton, a great artis who, while he was also a great painter, was intensely and con stantly interested in the progress of the arts of design and c the crafts in this country. To him they owed a very grea debt, because it was he who first began to remove the some what insular prejudice which was perhaps natural to th country, that a work of art must necessarily be an oil picture But there remained to them a great teacher, John Ruskin. I was impossible to estimate what that great mind and that grea writer had done for the arts of this country, and notwithstand ing a kind of reversion of feeling which had taken place in new direction, which they called impressionism, that grea mind and that great writer still survived, still interested ther and would continue to interest England as long as Englan was interested in art. The first thing that Mr. Ruskin did wa to call the attention of the English people to the beauties c nature. He also enlisted their interest in the earlier forms c Italian art, and he led them in a purer direction. Naturally, reaction came, and they found themselves after that extra ordinary era of purism suddenly launched into a French atmo sphere, which now went under the name of impressionism However, he was thankful to say that he saw considerabl signs of the malady abating, because until it had abated th arts of design would not have a fair chance.

Before he passed on to say anything about the admirabl work he had seen exhibited in the Society of Artists that day, h must congratulate the students upon the progress they ha made. Upon the last occasion he spoke to them he had som reason for saying that he thought in some directions they wer going upon a very wrong tack; whether they listened to hi and profited by his advice he did not know, but he had that da looked in vain to find a disagreeable impressionistic smudg The number of works exhibited was 1,115. There were 1,00 scholars in the principal school of Birmingham, there wer 3,000 in the branch schools, and those 4,000 students wer under the headmastership of Mr. Taylor. The time he ha spent in inspecting their work was very inadequate to do fu justice to what was before him, and for the same reason he fe that he could hardly do justice to their headmaster in th remarks he should have to make. He had indicated that h took a great interest in the crafts. He regarded them a essential to the welfare of the art of England, and especiall in Birmingham, where so much jewellery was made He was extremely glad to see such pains taken ove the drawings from still life. It used to be the fashio when he was a young man to say that it wa all nonsense studying from still life, that they learne nothing and could not enlist anybody's sympathy by such a uninteresting experiment. Now he confessed to thinkin exactly the reverse. He would rather that that study wa more insisted upon even than it was, because for the student i

was absolutely essential that, before he attempted to paint, as it were upon his own account, he should first of all learn to paint what he saw. By having things dexterously and charmingly arranged, as they always were in the Birmingham school, the student not only acquired a technical power over his material, but he was also stimulating his taste and his judgment, so that when he was called upon later to employ his higher faculty of perception he had become qualified to represent a thing which was more difficult than still-life painting. He was delighted to find that their master was wise enough to give them birds and animals to paint from. He had seen that day some charming drawings, some of them hasty but full of movement, of mice and butterflies and all such creatures, and especially one set of drawings which contained moths. In all the water-colour drawings he saw a sense of colour, which he was able to congratulate them upon and to say he thought was wholly remarkable. He took it that was because they had approached that study from the proper point of view, they had thought of their colour while they had been thinking of their tones. The vacation studies also interested him, because during the vacation the student was perfectly free to express his own ideas. It was then that whatever genius he had in him was likely to come out. That class of work had enormously improved since he last visited the school. The work was firmer, it was less empirical, the drawing was sounder and the colour purer. At the same time, he would like to see somewhat higher finish in the pencil drawings. There was a little touch of cleverness in getting over the ground with a little too much dexterity here and there, and he should like to see a very hard pencil-drawing giving all the effects and showing the student to be extremely modest and painstaking when he was before nature. They should attempt during the vacation to work a good deal from memory. It was not at all necessary to stand in front of a sunset and copy it there and then. If they trained their memory they would be able to hold that beautiful sunset in their minds, and represent it, perchance as Turner did, when they got home in the evening. Almost all the water-colour drawings by Turner which were in the possession of the country were done not directly before nature, but in the evening from little pencil drawings which he made on the spot. He cultivated his memory to such an extraordinary extent that Ruskin once said that Turner told him that twenty years afterwards he could remember the shape of a cloud which hung over Mont Blanc. If they photographed the picture upon their minds and digested it they would be able to give to their work that great charm of originality. The oil-painting was not so good as the water-colour. He was aware that it was a more difficult material, but it seemed to him they were not quite going on the right tack with that extremely difficult medium. He noticed in most of the works—clever as some of them were—a disagreeable edginess and disagreeable streaks of colour, especially in the shadows, where there should be no streaks at all. He asked them, for the purpose of chastening their style in painting in what he had called the very difficult medium, to study as much as they could the Flemish masters and especially Holbein. The students' work looked too much like the work of amateurs, it was not sufficiently restrained, it looked as if the student had sometimes worked with pleasure and sometimes with toil. Passing to the heads from the life and the time studies, Sir William said he found a great deal of good work, some of it showing excellent feeling and fine execution. Other samples were not free from defects. In one case, which Sir William singled out for special mention, the student was warned that he was a great deal too clever, and was advised as to means which he should take to curb a proneness to superficiality. As to the nude studies, Sir William confessed that he never much cared about that department, disliking the white backgrounds. He knew it was essential that those who were going to receive prizes should have white backgrounds, but the white background always falsified the tone, and he did not think they need spend quite so much time over the nude studies as they did. He would far rather see swifter drawings—under the impulse of the moment seizing the action—and more of them than he would all such highly-finished drawings as were those from the nude. In the efforts of modelling he confessed to seeing a great tendency to sketch in clay. If sculpture was to be worth anything at all it must be complete. There was a deal of clever work in the modelling, and a great deal of dexterity, but it was a sort of cleverness and dexterity which would never get any further—it was too facile, it was too easy, and it looked too full of self-content, and it was lacking in modesty. Whatever they did in clay or wax, or any plastic materials, he begged them to make up their minds to finish their work as highly as possible, and by the time they were getting towards the end they would see for themselves that nature was a long way ahead of anything that they could do to resemble her. Turning to the needlework, he confessed that was an art that had for him great charms, and they had developed in their school a kind of originality which was extremely agreeable. He thought the simplicity of colour they had adopted, and the application of the wool mixed up with a little not too glossy silk woven upon the rough linen, produced a most delightful result. There were two enamels which really showed genius, and which he should have liked to have bought had they not already been acquired by his excellent friend, Mr. Kenrick. He cautioned students against making their enamels too smooth. There was nothing so objectionable in a work of art as that it should look as if it had gone through a mill. It ought to look as if it had proceeded from the most sensitive thing which God ever made, the human hand, and it should have the very faults of the human hand, that inequality and that delightful uncertainty which made it into a human work and gave it interest. Let them not give way to mechanical monotony; roughness was better than lifeless uniformity; your machine could give you lifeless uniformity, and always did infallibly, but the hand never. There was some admirable gesso-work, and one or two notable achievements in beaten metals. It was most desirable that the graver should be used as little as possible, and that the hammer should be trusted as much as possible. He believed some manufacturers were trying to imitate the accidents of the hand by that very clumsy thing machinery; but they had much better not do that, because it would be only a very bad imitation of what the hand could do very much better. The specimens of work done in the branch schools organised by the Jewellers' Association were for the most part rather dull and lifeless, simply because they were over-worked; they were over-neat, too precise, and the hand in conjunction with the mind did not appear at all in their workmanship. There was only one specimen free in style and which really showed evidence of enthusiasm. It was, however, an admirable idea that the manufacturers should be taking the art school into their confidence, and he hoped they would employ the art students of Birmingham not only to design but to execute for them. They would find in time that they would get very much more interesting work, and as time went on and taste improved there would be a far greater sale for good work than there was at present. Sir William passed on to commend some of the work in figure design, and to offer some suggestive criticisms on certain technical effects. As to the stained-glass, he was glad to see that they did not ignore the point that the leading was an essential part. Let them remember this as an axiom, that the worst stained-glass was most like a picture. If they wanted to see the most abominable stained-glass that ever was they must go to Germany, but they would see a good deal, he was sorry to say, in England, some in St. Paul's Cathedral, and he hoped very soon to have the latter all out. Adverting to the examples of wall-papers produced by the students, Sir William said he noticed a tendency to non-observation of the relative planes of a design. With reference to the jewellery section, he pointed out that silver, bronze and gold each demanded different treatment. Their silver design should be thinner than their gold design was, and their bronze design should be thicker than either. Some manufacturers who were not particularly intelligent might think it did not particularly matter in what material they executed a design, and so they would make one ring in bronze, another in gold, and another in silver from the same design, but they would all look entirely different, and therefore the relative proportions would be entirely changed. They could not avoid the feeling when they remarked a bit of fine Florentine, French, German or Norwegian jewellery that the man who made it delighted in doing it. He altered it, he was dissatisfied with the result, but he was not all the time thinking, "Dear me, how pleased the duchess will be to flaunt this on her head." Jewellery which looked as if it cost a great deal of money was invariably vulgar. Jewellery could be extremely beautiful and very modest—indeed, it always was—and if there were any jewellers present let them take it to heart, and not encourage the vulgarity of the superior sex. In conclusion, he congratulated the successful students on obtaining prizes, and urged the unsuccessful to strive to gain prizes next year.

The Right Hon. W. Kenrick said they were all sensible of the debt which they owed Sir W. Richmond for his presence that night. He (the speaker) had never listened to any address on an occasion like that which seemed so suggestive and instructive to the students. Sir William Richmond was not only a painter but an artist craftsman, and the School of Art committee desired that those who studied in their schools should follow his lead, and when they had acquired a mastery of their craft should seek thought and ideas which they could convey in their work. He acknowledged the services of the headmasters of the elementary schools for the care they had exercised in selecting students for the free admissions in the branch schools, and said that now, besides free admissions to the branch schools, there were admissions for day scholars to the central school on examination. Those scholars were some of the most promising they had had, and he urged the parents to sacrifice something in order that their children might pursue their studies, so as to enable them to obtain better and more lucrative appointments



in the future. There was no doubt very good art teaching in the King Edward's Grammar Schools, but he hoped the headmasters would continue to make arrangements to send their promising students to the central school. The manufacturers did not at present take so much interest in the schools as they might do, and the number of students was not so large as the committee were prepared to receive, but as the knowledge acquired there was of such great importance in the workshops, he trusted that the manufacturers would take more advantage of the schools. If the sons of the manufacturers themselves obtained an artistic training it would be very beneficial to them, for they would be able to encourage and assist their designers and craftsmen in the factory. The branch school in Vittoria Street was doing a great deal of good work, but he hoped it would be made far more use of than it had been at present.

Mr. G. H. Kenrick seconded the motion on behalf of the School Board, and in doing so alluded to the fact that the whole of the art work in the Board schools, as well as the preliminary teaching leading up to it, is under the guidance of the School of Art committee and the headmaster of the School of Art. That was a happy augury, and he was glad to know that the teaching of drawing, which was obligatory in the boys' school, was now being voluntarily taken up by the teachers in many of the girls' schools. The motion was enthusiastically carried.

Sir William Richmond, in reply, commended the efforts being put forward in Birmingham to unite the arts with the crafts, and assured citizens that as long as they kept on that road art would permeate into all classes. It would get down to what was called the lowest section of society, and it would raise, because art could never be anything else but an elevating pursuit.

THE BRITISH ASSOCIATION OF DRAUGHTSMEN.

A SOCIETY is in course of formation under the above title, with the object of insuring more genial relations among capable draughtsmen, for the interchange of practical ideas, by means of papers read or contributed among themselves, and distributed for consideration and discussion in the various branches of the Association. It is the intention so far as possible to have none but competent draughtsmen as members, so that in the event of applications the secretary will be enabled to recommend men who suit the employers' requirements. The Association is to consist of members and associates. Members are to be draughtsmen who have served at least seven years in office and works or yard of architects, civil, consulting or mechanical engineers or shipbuilders. The subscription to be 10*s.* per annum. Associates are to be apprentices and improvers in any of the above departments from sixteen years of age, until qualified for the election of membership. Tracers may also be elected under certain conditions as associates from sixteen years of age. The subscription for associates will be 5*s.* per annum. A committee of management will be formed consisting of the five original or initial members, who can hold office temporarily until fifty have been elected. They are to be eligible for re-election for the ensuing year. The secretary is Mr. J. Gillaird, 34 St. Mary's Road, Canonbury, London, N.

Rights of Light and Air and the New Municipalities Bill for London.

Sir,—The present state of the law with regard to matters of light and air in building operations is one of great uncertainty, and productive of much waste of time and money, and frequently seriously impedes the building enterprises of those wishing to improve or rebuild their premises; and it is very often a question whether it is not worth while to pay a sum of money as blackmail rather than have the progress of the work stopped by an injunction, and risk the heavy expenses incurred in fighting an action often based on trivial, or even imaginary, rights.

How to deal with this question so as not to interfere with vested interests and rights, and yet at the same time facilitate building operations, may be a difficult problem, but it is not by any means an impossible one.

In Scotland these matters are dealt with by the Court of the Dean of Guild, and it ought to be possible to adopt some similar means here. It has been suggested that a Technical Court should be established, and every building owner, where any question of light, air or other easement arises, should be able to appeal to this Court, and cite before it all respondents who may be interested. Plans could be deposited, to which a interested parties could have access, and the Court would the proceed to hear the objectors and the building owner, an decide the limit to which the building could be carried witho interfering with the lights and easements of the objectors; b this means no injury would be done to the rights of eith party, and the decision obtained before the building owner pledged to his contract with the builder would most certain prove of invaluable service to those contemplating buildin and prevent blackmailing or useless actions.

The Technical Court would be composed of professiona men, who would not require expensive expert evidence to b brought before them to determine the issue, and who woul visit the premises and see for themselves. The nucleus such a Court is to be found in the Tribunal of Appeal unde the London Building Act of 1894; its numbers could be in creased, and additional powers given to it to charge th necessary fees for maintenance, and the whole cost of decid ing between the parties would be a mere fraction of th present unsatisfactory and wasteful course of fighting a ligh and air action. There could of course be an appeal t the Divisional Court, if thought necessary, and also th building owner, if he exceeded the limits laid down by th Court without first settling with his neighbours, would be pro ceeded against by the Court, who should have the power enforcing their own decisions.

To this end the Society of Architects in November las approached the Lord Chancellor with a petition, praying that parliamentary committee might be appointed to inquire int the present law with regard to ancient lights, with a view t saving the large amount of moneys being expended in deter mining the rights of owners with regard to same, when hi lordship intimated that he would give the matter his caref attention.

It is hoped that the hearty co-operation of the leaders o the professions, both architects, surveyors and lawyers, will b given to obtaining an Act of Parliament to deal with this sub ject, and thus enable us at least to be on an equal footing wit Scotland, and the present new Municipal Government Bill shoul give a good opportunity for forming the necessary Court unde the central authority, the London County Council.

C. McArthur Butler,
Secretary of the Society of Architects,
St. James's Hall, Piccadilly, W.

February 10, 1899.

GENERAL.

Mr. Thomas Brock, R.A., has received the commissio for the statue of Sir J. E. Millais, which is to be placed on th principal flight of steps in front of the entrance portico, or, as a alternative, in one of the open spaces in front of the Nationa Gallery of British Art at Millbank. If the subscription exceed the amount required for the statue the surplus is to b applied to the erection of such a memorial in St. Paul' Cathedral as the Dean and Chapter will approve.

Mr. E. Bramley-Moore has been elected an Associate o the Royal Society of Painter-Etchers.

A Portfolio, containing forty large photogravures o pictures by Rembrandt, with descriptions by Dr. Hofstede d Groote, will be published as a memorial of the late exhibition i Amsterdam of works by the artist.

The London County Council on Tuesday adopted resolution to the effect that it be referred to the genera purposes and improvements committees to consider th desirableness of erecting (in the space to be reserved fo refuges or ornamental enclosures) in that portion of th Strand which will be widened consequent upon the removal o the Holywell Street block of buildings, statues in honour of th memory of Geoffrey Chaucer and John Milton.

The Richmond Town Council are about to erect second block of seventy workmen's cottages in that Surre town. The lowest tender amounts to 17,624*l.*

Messrs. Dennett & Ingle ask us to announce that owing to the site of their late premises being required fo the erection of the new Government Offices, they have remove to 24 Queen Anne's Gate, S.W.

The Fourth Members' Meeting of the Liverpool Archi tectural Society, 1898-99, will be held at the Law Library, 4 Castle Street, on Monday next, the 20th inst., at 6 P.M., when a paper will be read by Professor F. M. Simpson on "Some Burgundian Churches," illustrated by limelight views.

During excavations in the Forum at Rome, on the 8th inst. eight large blocks of marble belonging to a cornice of the Temple of Julius Cæsar were discovered. The blocks are deeply embedded in the earth, in a position which they must have occupied since their fall from the edifice. It is expected that other discoveries throwing additional light upon the decoration of the temple will shortly be made.

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer on the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s.. by post 2s. 6d., on early application to the Publisher, Imperial Buildings, Ludgate Circus, London, E.C.

For Advertisement Scale, see page xiii.

Soho Cowl & Ventilator

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once

ELECTRIC NOTES.

THE Glasgow Corporation electricity committee have agreed by a majority to recommend that the Corporation offer 30,000*l.* for the buildings, plant, and rights of the Kelvinside Electricity Company. The agents of that undertaking have stated 48,000*l.* as the price at which they are willing to sell

LIEUT.-COLONEL C. A. SMITH, one of the Local Government Board's inspectors, held an inquiry in Bradford last week into the application of the City Council for power to borrow 20,000*l.* for the purposes of electric lighting extensions. Details of the proposed expenditure were given, and afterwards the inspector visited the electrical works of the city.

THE electric-lighting committee of Edinburgh Town Council had last week under consideration estimates for the iron and steel work of the M'Donald Road electric-light station, and those of Messrs. Redpath, Brown & Co., Edinburgh, and Arrol's Bridge Company, amounting to over 10,000*l.*, were accepted.

THE electric light was inaugurated at Carlisle Railway Station on the 9th inst. There are sixty-four arc lamps of great power for lighting the station and its approaches, with nearly 600 incandescent lamps for the buildings, booking offices, &c. The whole of the work has been executed for the joint station committee by the London and North-Western Railway Electrical Department at Stockport.

THE Whitehaven Corporation are considering the question of increasing the voltage of their electric current from 240 to 480. The long private consumption lines are at present sub-

Chief Office and Works:—GAINSBOROUGH ROAD, VICTORIA PARK, LONDON, N.E.

ject to difficulties of distribution, owing to the heavy drain now made on the current in the centre of the borough. To overcome these difficulties it is necessary either to increase the voltage or to decrease the present resistance by adding to the capacity of the feeding cables. In one case all that is required is an alteration of the dynamos, which can be made without great cost. In the other the additional cables would represent a much greater expenditure.

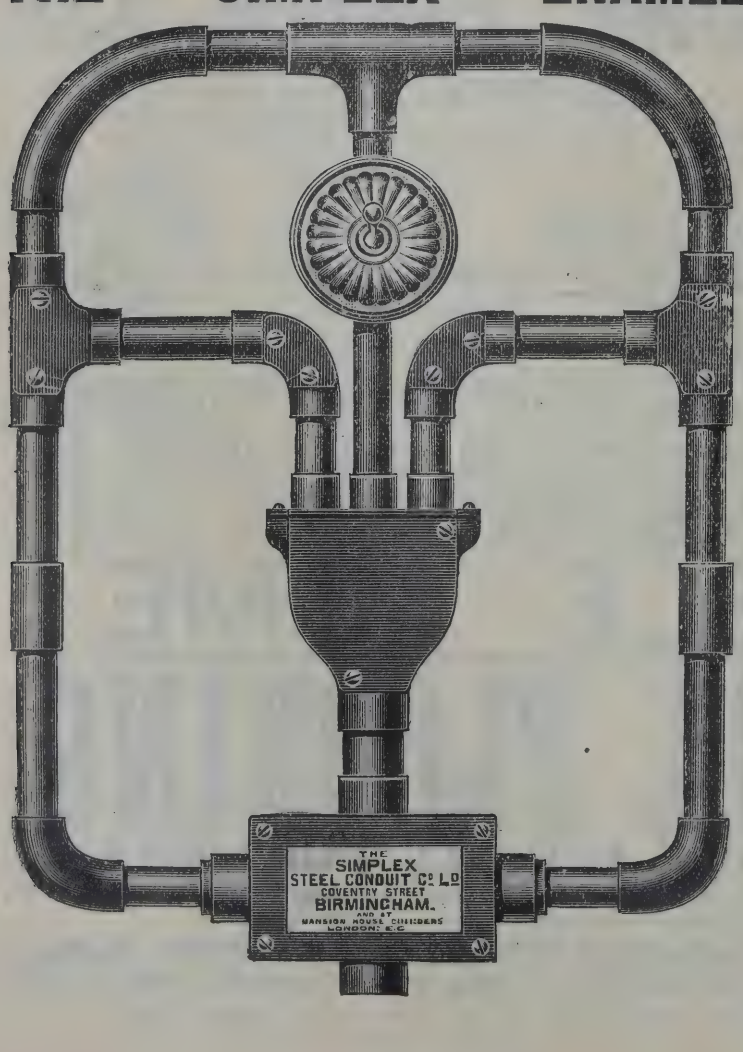
THE Mayor of Coventry (Dr. Webb Fowler) presided on Monday last at a town's meeting in St. Mary's Hall with respect to a Bill to come before Parliament to give powers of a varied character to the Leicestershire and Warwickshire Electrical Supply Company. His Worship proposed a resolution authorising opposition to the measure, and said that its character was such that, if it passed, the representatives of the ratepayers on public bodies would be compelled to seriously hesitate before undertaking the municipalisation of gas, electric light, water supplies and tramways. Alderman C. J. Hill seconded the motion, and touched upon the uselessness of trying to persuade the promoters of the Bill that their scheme could not prove a profitable one. The Council, however, desired to be left alone in their undertaking. Alderman Andrews, Alderman Loudon, and several other members of the Council supported the proposal, which passed unanimously.

AT the meeting of the Rothesay Harbour Trust and Town Council on Monday last, Provost the Marquess of Bute presiding. At the Trust the minute of agreement with Mr. George Halliday, contractor for the pier extension, was read and authorised to be signed. On the motion of Bailie Fisher, it was remitted to the harbour committee to consider as to widening the drawbridge, and to report to a future meeting. The Town Council unanimously agreed to appoint Lord Bute commissioner, and Bailie M'Intosh assessor, to the forthcoming Convention of Royal Burghs. On the recommendation of the bills committee it was resolved to petition in favour of the Glasgow and South-Western Railway Bill so far as the extension to Largs was concerned, and to petition against the Telephone Bill. The electric-lighting committee reported that they had visited various places where electric-lighting had been adopted, and as a result they recommended that a scheme estimated to cost 1,800*l.* for the lighting of the Harbour Esplanade, &c., be adopted. Under this scheme it was not intended to give a supply for private purposes, but it was to be kept in view that under the Board of Trade Order they would be obliged to give a private supply if asked. It was stated that the cost of the proposed installation would not exceed 1*d.* per £ on the rates. The recommendation of the committee was agreed to, and it was also resolved that the installation should be proceeded with at once in order to be in operation in July or August at latest.

VARIETIES.

THE completion of the memorial of Archbishop Benson, in Canterbury Cathedral, has been promised by July 8, and the unveiling has been fixed for that date.

A NEW Baptist church has been erected at Lowestoft from the designs of Mr. George Baines, of 2 Clement's Inn, W.C., and was opened on the 9th inst.



DURING the height of the gale on Sunday the minute hand of the western dial at the Antwerp Cathedral, weighing 150 lbs., fell with a terrible crash, breaking the windows of a small liquor shop in the neighbouring street.

THE first part of the scheme for the decoration of St. Michael's, Woolwich, has just been completed. Five angels, painted on canvas, after the style of Albert Dürer, have been placed above the large chancel arch, and the surrounding portion diapered in Indian red, and finished at bottom with a border upon the yellow brick.

WE regret to announce the death, which took place on the 1st inst. after a long illness, of Mr. Glenn, sole proprietor of the Seyssel and Metallic Lava Asphalte Company, 42 Poultry, E.C. The business will be continued as heretofore under the same management, with the addition thereto of Mr. George F. Glenn, the only son of Mr. Henry Glenn.

AN important structural improvement is just now being carried out in that part of the House of Lords which was formerly devoted to the chief librarian. Some time ago the House of Lords offices committee decided to discontinue the residence of that official, and as a consequence his salary was increased from 800*l.* to 1,000*l.* per annum. The various rooms of the House are now being reconstructed. The drawing-room has been converted into an additional committee-room, while the dining-room, it is stated, will henceforth be used as a smoking-room, in connection with the library, it being understood that in due course the rest of the building will be appropriated in like manner.

THE BRITISH FIRE PREVENTION COMMITTEE.

HE first official test under the auspices of the British fire evention committee took place at its testing station, off egent's Park on Wednesday afternoon at 3 P.M. The subject nder investigation was a floor constructed by the Expanded Ietal Company, Limited.

Sir Arthur Blomfield, A.R.A., attended to represent the ouncil, and among the ten representatives of the committee ere :—Messrs. Arthur M. Watson, district surveyor, St. eorge's, Hanover Square ; Bernard Dixie, district surveyor, ast Newington ; Benjamin Tabrar, district surveyor, Green- ich ; Frederick Hammond, district surveyor, East Hamp- ead ; Edmund Woodthorpe, district surveyor, Northern ivision of the City of London.

The test was conducted by a special sub-committee of the ecutive, comprising Mr. Max Clarke (directing member), r. Ellis Marsland (district surveyor, Camberwell), and Mr. harles E. Goad, C.E., with Mr. Edwin O. Sachs (chairman of e executive), and Mr. F. Farrow (chairman of the Commercial ction), *ex officio*.

Among the special visitors was the technical attaché of the erman Embassy (Mr. H. Muthesius).

The official illustrated report will be issued in due course.

TRADE NOTES.

HE ventilation of St. Fittick's parish church, Torry, Aberdeen, r. A. L. H. Mackinnon, architect, is being carried out by eans of Mackay's patent invisible roof-ventilators, manu- ctured by the sole makers, Cousland & Mackay, 150 Hope reet, Glasgow.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, ve just supplied their patent Manchester grates to the New ottage Hospital, Ramsbottom.

A HANDSOME new chancel screen, presented to the amington parish church by Alderman S. Flavel (church- warden), was dedicated on Saturday afternoon, in the presence of a large congregation. The screen is of hammered wrought-iron, richly decorated and constructed from designs prepared by Sir Arthur Blomfield. It is about 26 feet high, and surmounted by a handsome Maltese cross 7 feet high and weighing 1½ cwt. The screen adds much to the beauty of the church, and is the finishing work in the task of restoring the chancel, which Mr. Flavel nearly completed ten years ago. The screen is the work of Messrs. Hart, Son, Peard & Co., Limited, of Drury Lane.

A FINE clock has just been erected at Vaynol Park, Bangor, North Wales, of the very best quality, with Lord Grimthorpe's double three-legged gravity escapement, compensation pendulum and all the latest improvements. The time is shown upon two skeleton cast-iron dials fitted in with white opal glass for illumination, there being an automatic gas apparatus attached for turning on and off the gas according to the season of the year. The clock strikes the hours upon a large bell for the convenience of the woodmen and farm servants, and can be heard at a great distance. The clock and bell has been supplied and fixed by Messrs. Wm. Potts & Sons, clock manufacturers, of Guildford Street, Leeds, from instructions received from Mr. J. P. Lort, steward to Mr. J. Grant Duff Assheton-Smith, J.P., the owner of Vaynol Park. The tower was erected by Mr. Williams, architect to the estate. Messrs. Potts & Sons, of Leeds, the makers, have also in hand a very large clock and bell for the new Barry Dock offices, Cardiff, South Wales.

THE Climax Ventilating and Heating Company, Limited, with a capital of 3,000*l.* in 3,000 shares of 1*l.* each, has been formed for the purpose of taking over and carrying on the business of the Climax Ventilating and Heating Company, with their patents, trade-marks, designs, &c., under an agreement with Mr. James Cousland, ventilating engineer, 93 Hope Street, Glasgow, and to provide capital for the further development of the business in its different branches of ventilating, heating and sanitary engineering. It is intended to add to the business that of lighting and electrical engineering in connection with ventilation. The company have secured the service of Mr. James Cousland, ventilating engineer, who has had a very long practical experience in connection with some of the largest ventilating firms in the country, having for ten years acted as manager for Messrs. Robt. Boyle and Robt. Boyle & Son, Limited, and in connection with the Climax Ventilating Company.

O ARCHITECTS, SURVEYORS, &c.

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent"), having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

ARCHITECTS SHOULD SPECIFY

CHING'S Patent Mica Valve Chimney Breast Ventilator, or

CHING'S New Patent Silent Chimney Breast Ventilator.

TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM

BUILDING AND BUILDERS.

THE foundation-stone has been laid at Birtley, Durham, of a new Primitive Methodist chapel, which is to cost 2,800*l.*

A SITE for a new Methodist New Connexion chapel has been secured at Malin Bridge, near Sheffield.

IT has at last been resolved to carry out a scheme of restoration at Brierley Hill parish church at a cost of 5,000*l.*

THE bricklayers employed by the Battersea Vestry are on strike, and all the Vestry's building operations are suspended. The strike was occasioned by the surveyor or Vestry ordering a plasterer to do some tiling which the bricklayers regard as part of their own particular work. The Vestry has been placed on the "Unionist black list."

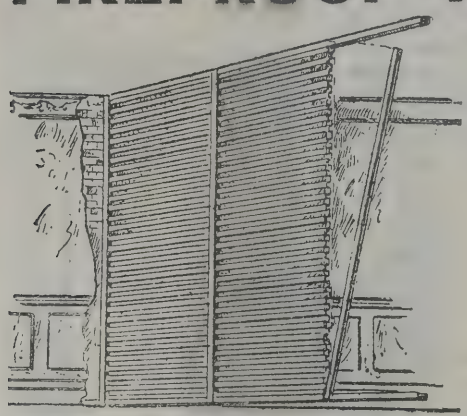
THE scaffolding of a new building in course of construction in the suburb of Holensee, Berlin, collapsed on Saturday afternoon, carrying with it five of the workmen engaged upon it. Four are reported to have been killed, and the fifth is so seriously injured that his recovery is doubtful.

AT the Ayr Town Council meeting on Monday the question of a site for the town hall was again under discussion, and it was agreed by 12 votes to 4 to acquire the site at the corner of Sandgate Street and Fullarton Street, which had been offered at the price of 4,200*l.* The ground extends to about three-quarters of an acre.

THE Portessie (N.B.) Harbour committee have decided to get a preliminary survey of the shore at Portessie as to the most suitable site for the construction of a harbour, along with an estimate of cost, from three engineers—one in Aberdeen, one in Inverness, and the other in Oban. The site which is received with most favour is at the east end of the village, a few hundred yards from Craigenroan.

THE sixth annual dinner of the Timber Trade Federation took place on Monday night at the Trocadéro, London, Alderman Low, Bristol, presiding. Sir H. Seymour King, M.P., and Mr. Batty Langley, M.P., expressed the hope that the present session would see a Bill passed compelling limited liability companies to give notice before issuing debentures, so as to protect honest traders. Mr. Langley also said that workmen's compensation should be a national system. Government could protect itself by placing a tax on the wages sheet. It was urged by other speakers that Parliament should pass a general law concerning the question of lights, and not leave the matter to interfering local authorities.

THE church of St. Peter, Bury, Lancashire, which was built as recently as 1872, at a cost of 5,000*l.*, has been declared unfit for public worship on account of the giving way of the walls. A scheme is now being started to pull down the old building and erect a new church on the same site. The material of the old church will be utilised as far as possible, but it is estimated that 3,000*l.* will be required in addition to complete the scheme.



AT the new Lyceum Theatre, Eccles, a journeyman decorator named Frederic Mason was killed on the 10th inst. He was engaged in decorating the ceiling of the theatre when in consequence, as it is believed, of the slipping of a plank, he was precipitated to the floor of the pit, a depth of 60 feet. Mason was about thirty-four or thirty-five years of age, and belonged to Morecambe. This is the first serious accident that has happened during the building of the theatre, the opening of which is fixed to take place at the end of this month. The deceased was employed by a London firm, and only began work on Wednesday.

THE Corporation of London have decided to make improvements at the City of London Lunatic Asylum at Stone, near Dartford, at a cost of 85,850*l.* The original estimates—70,000*l.*—which the Common Council accepted in October 1897 included amounts for the warming, heating, lighting and engineering works in connection with the new building, but further inquiry has led to the condemnation of existing boilers, the replacing of which, together with the installation of the electric light in the asylum, has necessitated the increase in the expenses of 15,850*l.* A report sanctioning this enhancement has passed the Corporation.

IN addition to the large building now in progress close to the high-level station, Wolverhampton, the directors of Chubb & Son's Lock and Safe Company, Limited, have this week decided to also build over the rest of the freehold land which they acquired recently from the Wolverhampton Corporation. Messrs. Chubb's Company have large works in London for strong-room and patent safe making, but it is found that the accommodation provided at these works, together with the lock factory in course of erection at Wolverhampton, will not be sufficient for the present requirements of the business, to say nothing of further necessities. The further additions will be of a substantial nature, affording accommodation for 100 more men, and when the whole of the new buildings at Wolverhampton are fully equipped, they will have cost the company between 15,000*l.* and 20,000*l.*

CORK PAVEMENT is NON-SLIPPERY, NON-ABSORBENT, NOISELESS
Proved by over six years' experience under heavy road-traffic to be more durable than wood.
Recommended by the highest Authorities as the Best and most Sanitary Pavement for **Streets, Stables, Kennels, Yards, Basements, Church Aisles, &c.**, whether for outdoor work or under cover. Can be seen in London and the provinces in all above cases.

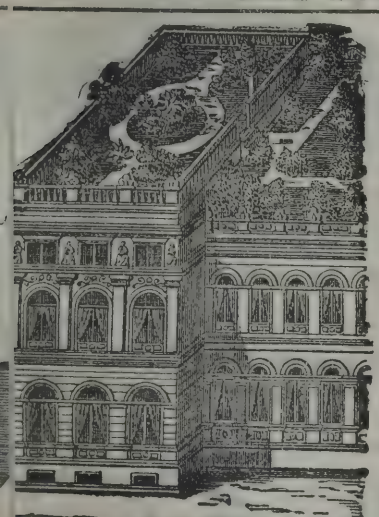
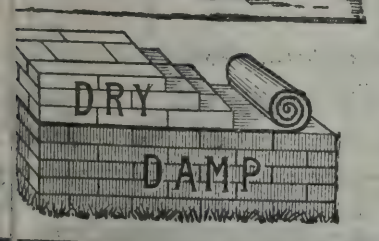
The gable of a house in course of erection in Ann Street, Aberdeen, fell on the 10th inst., with the result that three masons, named George Christie, John Massie and his brother James Massie, were seriously injured. The accident is attributed to the recent heavy rains, which had loosened the stone. In the course of investigations, a sad discovery was made among the ruins inside the building. John Ferguson (twenty-one), an apprentice mason, had been at work at the top floor when the gable fell, but in the confusion that followed he was not missed. His sister, however, called to inquire if anything was wrong, as he had not come home to dinner. A search was made among the fallen masonry, and the body of Ferguson was discovered lying under a pile of stones and rubber. He had been terribly injured about the head, and life was extinct. The other three men are seriously hurt, but are progressing favourably.

At last week's special meeting of the Oldham School Board the minutes of one of the committees, involving a contentious principle with regard to tendering, were passed without objection, the contending parties having settled their differences in order that the work might not be checked. Mr. F. W. Potter, in proposing the adoption of the minutes, referred to the new mixed school at Roundthorn. He said the cost would be more than the limit of 10*l.* per scholar fixed by the Board, but it would be impossible to provide a reasonably good school within that limit. When finished he would not fear to compare it with the school at Dukinfield, which had been described as the best elementary school in the United Kingdom, and which, they had been told, had been built at 10*l.* per head. He and other members had visited the latter school, and in no way, either as to general character of the building or quality of material, would it compare with the contemplated Roundthorn school. The Chairman observed that these remarks were more bold than prudent, but the minutes were adopted without further comment.



The Archbishop of Dublin recently laid the memorial-stone of the new National schools, under Church of Ireland auspices, now in course of erection in Lower Sherrard Street, Dublin. The plan of the new building has been determined in some measure by the outline of the ground, and will take the form of a Greek cross, its greatest length and breadth being internally 124 feet and 46 feet respectively. It will consist of a single storey. This arrangement is a convenient one for teaching purposes, and enables the entire floor space practically to be available for large meetings and for drill purposes when so required. When not so used rolling shutters will be let down to divide the space into schoolrooms of suitable size. There are two main entrances from Sherrard Street, leading through roomy porches to the boys, girls, and infants' schools respectively. The number of children to be provided for is 500, and the accommodation afforded fulfils all the requirements of the National Board of Education. The walls are constructed of breeze concrete; the dressings of the openings and the plinth, &c., courses, are of brick, red facing brick being used on the exposed portions. The intervening space will be covered with pebble dashing. Internally the roofs will be open to half their height, the timber principals being exposed and stained. The lower part of the walls will be lined with wainscot, the upper portion being plastered. Due provision has been made for efficient sanitary fittings, and for ventilation and heating. An ornamental turret will surmount the main roof over the centre of the building, which will also serve as an outlet ventilator for extracting the vitiated air from the various classrooms. The architect is Mr. W. M. Mitchell, of Leinster Street, under whose superintendence the building is being erected.



The members of the Barnsley Building Trades' Federation threaten to lock-out the whole of the trade union labourers in their employ. In September the plasterers employed by Mr. Lindley struck work because material was being obtained from a firm at Mirfield which employed a man who had failed to pay a fine imposed by the National Union of Plasterers. This was settled, but the Barnsley Labourers' Union imposed a fine on a labourer who had continued to work for Mr. Lindley when the strike occurred. The man would not pay the fine, the labourers struck, and Mr. Lindley's shop has been idle ever since, as the plasterers cannot work without labourers. The Federation, having failed to obtain a settlement, have given notice that if the objection against Mr. Lindley's shop is not removed by Saturday next, they will lock out all the trade union labourers in their employ. It is said that there are plenty of non-union labourers to be had, but a settlement is hoped for.

NOTTINGHAM MASTER BUILDERS' ASSOCIATION.

The annual dinner of the Nottingham Master Builders' Association took place on Friday evening under the chairmanship of Mr. Enoch Hind, in the absence through illness of Mr. James Wright, the president of the Association.

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

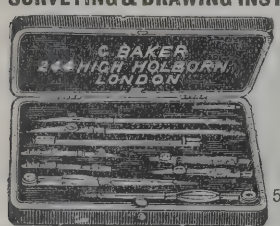
OLD FORD, BOW, LONDON, E.
Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

IX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered. Price 12*s.* 6*d.* Office: Imperial Buildings, Ludgate Circus, E.C.

Mr. Vickers, who proposed "The Architects," regretted that no gentlemen of the profession were present to respond.

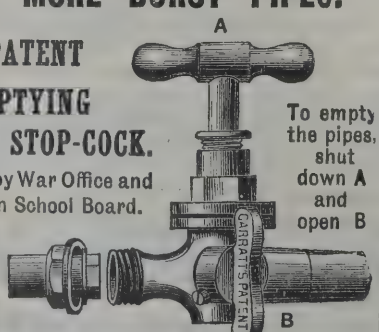
On rising to propose "Success to the Master Builders' Association" the Chairman was heartily greeted. He said the Association had been formed for only two or three years, but he was pleased to inform them that during the past year their membership had increased by 31. They had had 140 meetings during the twelve months, and the members on the books to-day were 99. He hoped they would soon exceed 100. They were all aware that they had had some differences with the architects and with the men during the year. At its beginning there was a strike with the labourers, and of course the old song again—the bricklayers were in sympathy with them. There was only one thing—the Association had to give way to it because work was good; but he was sure that so long as they remained banded together they would go on progressing, and not only progressing, but they would be even more successful in the undertakings of the future than they had been in the past. The chairman concluded by sympathetically referring to the decease of two old friends of the Association, Mr. Fred Messom and Mr. Enoch Kent.

Mr. George Fish responded, and observed that although the Association had had several difficulties to contend with they had been amicably overcome. They had met the bricklayers on several occasions, and the latter had met the masters in a fair spirit, and it was sincerely hoped that the plasterers' matter would eventually be settled without any deleterious issue. In conclusion Mr. Fish expressed a hope that all the members of the organisations would do their utmost to promote its success.



OLYMPIC THEATRE.

AMONG the properties scheduled by the London County Council for purchase in connection with the proposed new street from Holborn to the Strand is the Olympic Theatre in Wych Street. The lessee of the theatre has recently written to the improvement committee of the Council offering to dispose of the unexpired lease of the theatre for 12,000*l*. The lease has fifty-one years to run from December 31, 1898, at a rent of 2,250*l*. per annum. The agent acting for the lessee states in one of his letters to the committee that, whilst willing to meet he Council in the matter, he has instructions, unless the Council purchases the lease immediately, to sell the property to others who are prepared to purchase as a speculation. The committee think the amount a reasonable one, and considerably less than the cost would be if the Council waited until it obtained its special Act of Parliament, and declined to avail itself of the present opportunity for purchasing by agreement with the lessee. In their report upon the matter the committee deal with the question of whether the Council has power to purchase the property in anticipation of the passing of an Act of Parliament, and they say it appeared that the Council had power to purchase the theatre. If the Council's Bill for the new street should be rejected by Parliament—a contingency which the committee think it hardly necessary to contemplate—the Council would have a valuable asset in the lease of the Olympic Theatre, and would be able to dispose of it without loss. The valuer estimated the saving to be effected by immediate purchase at no less than 25,000*l*. The committee had no hesitation in advising the Council to save so large a sum, and accordingly recommended the Council to pass the necessary resolution for immediately acquiring the property at the sum stated.



COTTAGE FLATS IN NORWICH.

NORWICH has set itself, says the *Mercury*, to solve a great problem. This is nothing more nor less than supplying the 17,000 inhabitants of the city courts and yards with good sanitary dwellings. It appears probable that in the majority of instances this will have to be accomplished by the owners making improvements in the houses already inhabited. But this opens up a further problem. Should the owners expend any considerable sum in improvements, as a natural consequence they will endeavour to raise the rents to recoup them for their outlay. Notwithstanding that the ethical side of this question will not bear close investigation—for in the majority of cases the profits have been sufficiently large for a number of years to have fully provided for the improvements which are now being made compulsory—yet this is a result which is almost bound to accrue. But in many cases the inhabitants are now paying the maximum rent which their income will allow. It is the general experience that habitations at a rent within the reach of the average labouring man are so scarce that hundreds of them are paying rents so proportionally high to their wages as effectually to cripple their

nances, and throw them into a chronic state of impecuniosity. and in the heart of the city is so valuable as to make it a atter of extreme difficulty to procure the necessary air-space, uild cottages to satisfy the requirements of the by-laws and at e same time obtain a sufficient return for the money invested. ere the tramways will render efficient aid by carrying work- en to and from the suburbs in reasonable time. There land not so valuable, the air is pure and plentiful and good sanitary nditions can be secured in a locality newly-opened up, far sier than by endeavouring to improve the surroundings in hat may have been an inhabited area for centuries. Street ter street of houses ranging in rental from 8*l.* to 20*l.* has been ected on the outskirts of Norwich. In a very few instances, owever, have speculative builders erected cottages to let at . 10*s.* per annum, chiefly on account of the financial diffi- ulties in the way.

In Anchor Street—which runs from Barrack Street towards lousehold, and will eventually be continued to the borders of e Heath—a new departure has been made in Norwich by the rection of cottage flats by Mr. George Fitt, whose enterprise most commendable. The locality is in every way suitable. he distance from the city is not too great, there is an un- nited supply of fresh air, the situation is high above the river ith a sandy subsoil, and there are splendid views obtainable the city and especially of the cathedral. Mousehold Heath close at hand, and there is very little probability of that ever eing enclosed, so that the open country is practically at the oors of the inhabitants. Twelve cottages have already been ected, providing accommodation for twenty-four tenants, and e row when completed will contain nineteen cottages, with, course, double that number of tenants. Anchor Street is the gulation 36 feet in width, and is now in process of being made up" by the Council. Viewed from the exterior the ttages have a neat and substantial appearance, the front evation differing but little from that of the ordinary cottage, ve that there are to every house two doors side by side, ne giving access to the ground-floor and the other by a nort passage and a flight of stairs to the first-floor. These e in what is virtually a porch. The cottages are built of red ick with white facings, and are tiled. In front of each house a small patch of garden enclosed by palisading, with ntrance-gate. The ground-floor contains a fairly roomy ntrance-hall, bedroom, living-room (containing pantry) and tchen, all fulfilling the requirements of the city by-laws. All e rooms are 8 feet in height. The kitchen window looks on to a paved yard, and the kitchen itself contains a neat little fireplace and oven, a copper, the Waterworks Company's supply and an earthenware sink. The drains are all well trapped, and the rooms ventilated and better lighted than are the average. At the rear of the piece of garden is a ventilator by which the air obtains an inlet, and thus a free and constant passage and rush of air is obtained through the drain ventilating pipe. There is a water-closet for every two dwellings, joined to the coal-house by a covered passage. The coal-houses are separate. An ingenious arrangement has been made for the bins. A brick chamber was constructed, and the galvanised iron removable bin placed therein. An opening in the side of the brick chamber is provided with a flap similar to a letter box, for the use of the tenants on the ground floor, while a 9-inch pipe rises from the roof of the brick chamber to the flat above, and so enables the tenants there to utilise the same bin. According to the city by-laws each house must have 150 feet of open space in the rear. This was easily obtainable with regard to the ground floor, but it was some time before the plans committee of the Council would agree to the plans for these flats, because they thought that the space on the cement-concrete flat on the first floor—the most airy part of the whole building—ought not to be included in the 150 feet of "open space." Since their erection they have been inspected by the city engineer and the plans committee, and passed for habitation. So much impressed with them was one member of the Council that he intends erecting fourteen similar cottages (that is twenty-eight tenements) as soon as the plans are passed.

To all intents and purposes the first floor flat is an entirely distinct habitation from that on the ground floor. There is a separate entrance from the street into a small passage, and then by a flight of stairs into the living-room. Here there are two bedrooms, the space over the two passages being available—which is not the case with the ground floor. These are efficiently ventilated. The living-room and kitchen are fitted up like those on the ground floor, and the latter opens on a cement-concrete flat, from which access is gained to the coal-house and water-closet, constructed in a similar manner to those below. A splendid view can be obtained from this flat, which is probably the nearest approach in Norwich to the flat roofs of the houses of the Orient. Here a man may sit on a summer evening and enjoy the fresh air sweeping down from the rolling slopes of Mousehold Heath, certain he is breathing that which will recuperate him for the toil of the day, instead of, as in so many of the city courts and yards lowering his vitality, and so

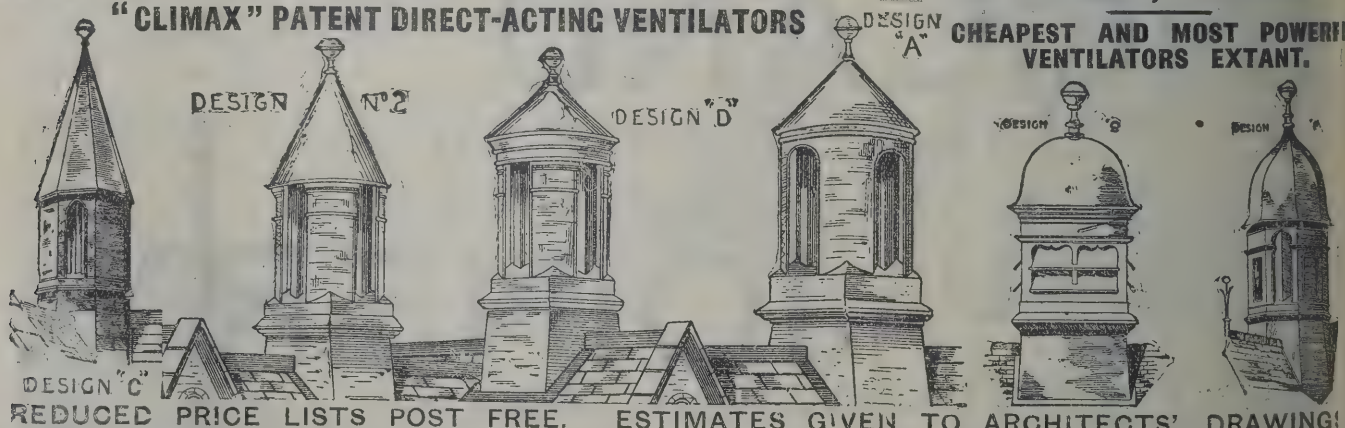
rendering him less able to battle against the encroachments of disease. If the occupants of the first floor have not the garden advantages of those on the ground floor, they have ample compensation in the beneficial altitude of their flat. Although unable here to fully enter into the financial aspect of the question, it is asserted on the best authority that an excellent return for money invested can be obtained by a rent for each flat of 2*s.* 6*d.* per week, or 5*s.* for the two floors. In this particular instance the bricks were made at a private brickyard; but putting that fact aside, it seems safe to assume that what private enterprise has done the municipality can do; that at least is the experience of other localities. And that, too, without throwing any burden upon the rates. Much, of course, depends upon the class of tenants, and in these cottage flats there is not sufficient accommodation for persons with large families. Mr. Fitt holds that a person should not pay more than an eighth of his income in rent, and it is therefore the class earning about 1*l.* or 1*l.* 5*s.* a week that these cottage flats more particularly benefit. Yet even for these, applications have been received from workmen earning 2*l.* and over per week—applications which by the way have in all cases been declined, as it is held that they can well afford 5*s.* per week for rent. These cottage flats are the first examples in the city, but it seems probable that in the near future the principle will be considerably extended. If so, and healthy habitations are provided at a reasonable rental within the reach of the ordinary working man, the slum problem will be considerably nearer a satisfactory solution.

COLLAPSE OF ROOF, CHRIST CHURCH, BIRMINGHAM.

THE coroner's inquiry into the circumstances surrounding the death of two men through the fall of roof-timbering at Christ Church, Birmingham, on Tuesday the 7th inst., took place at the Victoria Courts. The deceased men were George William Stokes (thirty-nine), of 230 Camden Street, and John Peaton, otherwise Patton, 7 Ladywood Terrace, Eriston Street. Their regular calling, says the *Birmingham Post*, was that of telephone-wire men, but recently they had been assisting in the demolition of Christ Church, and were described by their employer as two of the best workmen he had ever had. The inquest was attended by Major Roe, Her Majesty's inspector of factories; and Mr. Noble, barrister, represented the widows of the deceased, and also obtained the coroner's permission to ask several questions on behalf of Mr. Benton, the contractor, it being explained that the interests of these parties were not antagonistic. After evidence of identification had been given,



Mr. William Hale, architect, put in plans which he had made since the accident, illustrating salient features in the construction of the church. He said the beam which gave way was 65 feet long, and had a bearing of nearly a foot on the masonry on each side. The roof was constructed on the queen-post and king-post principle, the timbering being connected by a system of struts and iron ties. So far as design went it was exceedingly good and strong.

Mr. James Benton, the contractor to whom the removal of Christ Church was committed, stated that on the morning of the 7th inst. the weather was too bad for the men to work on the demolition of the roof of Christ Church. He would not allow the gangs of workmen to ascend to the rafters, but he and his brother went up, and by way of forwarding matters preparatory to the resumption of work, they sawed partly through the principal rafter close to where it was bolted to the beam which afterwards gave way. They proposed later on to lower the roof timbers, and meanwhile witness instructed his brother to secure the beam and other parts of the structure with ropes attached to the joists of the belfry. He then left the site, leaving his son in charge, with authority to recommence work as soon as the weather permitted. Some two hours later he heard an accident had happened, and hastening to the spot found the beam had broken at the queen-post in the mortise.

The portions of the beam at the point of fracture were produced in court. The timber was partially decayed, particularly in the mortising.

Witness went on to say that when he saw the workmen Stokes and Peaton in the General Hospital afterwards they both said that no blame attached to anyone.

In reply to Major Roe, witness explained that the process of removing the roof would have been to take the top timbers first, and as they progressed to put in temporary timbers to sustain the lower framework. They sawed the end of the principal rafter to within about 2 inches of its extreme thickness, and did so because it was impossible to release the pin which secured it to the beam. Between the rafter and the beam there was a strut. When they sawed the beam there was no indication of any disturbance of the strain, nor did a cursory inspection of the queen-posts disclose any indications of rottenness.

Mr. Charles Benton, brother of the last witness, said that, accordance with the instructions he received, he got on to e roof-timbers shortly before two o'clock to tie a rope on to e upper timbers. At this time there were three workmen on e horizontal beam to assist in fastening the rope at that end, d suddenly witness heard a crash and saw his companions ecipitated to the ground. He was also thrown from his nding place, but managed to clutch at some wood and save nself. The men who fell were Stokes, Peaton and another med Green, and at the time of the accident they were stand- close together very near to the point where the fracture curred.

Thomas Green, who had a surgical bandage on his head, d appeared to be very weak, said that whilst waiting on the am with Stokes and Peaton to receive the rope from Charles nton, who had climbed higher up to secure it to the top nbers, he heard a crash, fell from the beam and remembered more.

John Thomas Paget, a carpenter, who had been engaged in tting up a hoarding round the church, Thomas Ireland, a bourer engaged on the roof at the time of the accident, and olice-constable Henry Fowke spoke to the positions in which e injured men were found lying after the fall.

Mr. F. Victor Milward, a resident surgical officer at the eneral Hospital, said that Stokes was suffering greatly from ock when admitted to the institution. There were symptoms fracture of the spine, and fractures of the collar-bone, ribs d pelvis were ascertained. The patient died the same ening. Peaton only bore evidence of abrasions, but since death on Thursday witness had made a post-mortem amination and found the pelvis and one rib fractured, and ere were other internal injuries.

Mr. Hale, recalled, said that, having heard the evidence of e witnesses and examined the question in other aspects, he d come to the conclusion that the cause of the fracture s the rottenness of the wood, coupled with the fact men walking on the beam and springing. Possibly weather might have had some effect on the sappy od. At the New Street end he found evidence of dry- t in the beam, and throughout portions he had examined arly three-fourths of the wood had perished. This was not ticeable from the outside, however. If the beam had been roughly sound it would have been more than sufficient for e weight it had to bear. It was Baltic timber of unusual antling and length, such as it would be impossible to obtain at the present day. It would have borne ten men had it been sound. He thought it was imprudent on the part of those in charge of the work not to take proper means to stay the tie beams all along the centre if they were intended to be taken down piecemeal. He scarcely thought the saw-cut contributed to the accident. The attachment of a rope to the beam, as was proposed to be done, would not have prevented the fall; a chain would have been necessary to resist such a strain.

The Foreman of the Jury (Mr. S. E. Short): Are there any by-laws that control the pulling-down of buildings? Witness: I do not know.

This was all the evidence, and the Coroner summed up, expressing sorrow that the demolition of the church had not been accomplished without loss of life. As to the question whether anyone was guilty of criminal negligence in connection with the work, to his mind the evidence did not go to the length of suggesting that, nor did it even tend in that direction.

The jury returned a verdict of "Accidental death," and added that they thought the city authorities should take cognisance of the demolition of buildings, seeing that it was attended with considerable danger to life and limb.

The Coroner promised to convey the representation to the proper quarter.

VULCANITE ROOFING FIREPROOF.

AN interesting and eminently satisfactory test of the fireproof qualities of the vulcanite roofing made by the Patent Vulcanite Roofing and Asphalte Company, of Bow, took place last week at Wolverhampton on a piece of ground in Lever Street, off Green Lane. Some small cottage-like buildings had been hastily erected, consisting of two apartments, the one roofed with an ordinary span slated roof, the other with a flat vulcanite roof. Both had plastered ceilings, a door, a window and a fireplace, and were filled with highly inflammable material.

The fires were lit at 2.20 P.M., and were kept strongly burning for an hour and a half. The ceiling under the vulcanite roof succumbed quite fifteen minutes in advance of the other, and it was wonderful to note how long the slates lasted. They began to slide off, however, one by one, the slate-laths burning completely away, and each slate remaining whole. The vulcanite roof, however, remained intact to the end. Quite thirty minutes of clear smokeless fire was playing upon the underside of the vulcanite after the slate roof was beginning to go. The build-

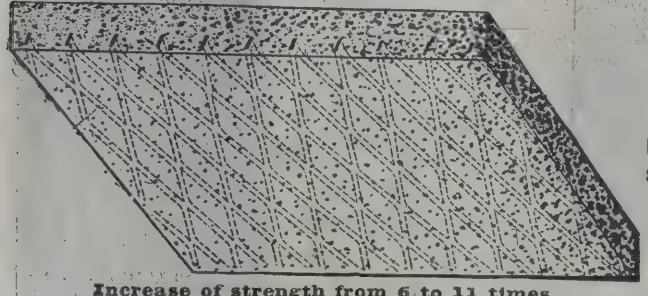
ing was filled up three times with successive piles of firewood, in order to keep up a strong heat. After the firemen had extinguished the flames five men stood upon the flat roof, and jumped about to test its strength, thus proving that the joists and flooring upon which the vulcanite material was laid was fully intact and strong, although charred beneath. A fireman cut out a piece of the vulcanite material during the fire, and although it was somewhat plastic from the action of the strong heat passing over it, no sign of flowing was noticed, and it had not even soiled the boards upon which it lay, and which remained white and clean. The whole heat of the fire escaping by the door and window was carried directly over the vulcanic roof by the slight wind prevailing, thus showing that sparks and heat did not ignite it outside.

The whole success of the test, severe as it was, was entirely due to the fact that vulcanite roofs are laid on boards 1 inch thick, tongued and grooved tightly together, thus forming an air-tight covering and affording no encouragement to a fire. The timbers for vulcanite roofs are always of the same strength as those used in the room floors beneath, and are laid in the same way.



At the conclusion of the experiment, which was witnessed by some hundreds of spectators, Captain Burnett, Mr. Elliot (superintendent of the fire brigade) and the borough surveyor expressed themselves amply satisfied of the superior fire-resisting qualities of vulcanite for roofing purposes.

GREAT CENTRAL RAILWAY.

The Great Central Railway to London will be opened, says the *Standard*, for general traffic on March 1, the terminus of the line—which is a development of the Manchester, Sheffield & Lincolnshire Railway—being in Marylebone Road. For some months the rails have been in use to convey coals and other merchandise to the Metropolis, but they will not be utilised for the conveyance of passengers till the end of this month. Coal and other heavy traffic will provide no small portion of the income of the company; indeed, they furnish the chief reason for its existence. The old Manchester, Sheffield & Lincolnshire Railway was being steadily fenced in by other companies, just as the prosperous Lancashire and Yorkshire Railway has been, and the directors foresaw that unless they broke fresh ground and made a way to the Metropolis their organisation would be no more than a mere system for th collection of goods for other lines, especially the Grea Northern and the Midland Railways. The result i the creation of a new main artery to the north, wit feeders to towns where competition in railway enter prise will be heartily welcomed. The original pla was to have utilised the existing lines of the Metropolita Railway from Quainton Road, forty-four miles from Marylebon But the two companies have since disagreed, and an arrange ment has been come to between the Great Central and th Great Western under which, as stated last week by the Earl c Cawdor, chairman of the latter company, the new line will b made practically independent of the Metropolitan. Under th old arrangement the Great Central used the Metropolitan rail from Quainton Road to Harrow, but from that point additiona rails were laid down to West Hampstead by the Metropolita Company. From West Hampstead the Great Central owne the two miles of metals into the terminus. But it obtaine further powers to make branches at Banbury, and fro Neasden, where the company have their engine sheds, to th Great Western Company's main line, and the Bill which th two companies are promoting this session will enable them t build jointly a line connecting the Wycombe and Oxford Rail way with the Great Central line near Grendon Underwood, fo which Princes Risborough will be the junction, some thre miles from Quainton Road. The journey will be a somewha longer one, but it means that only about three miles of Metro politan metals will require to be used by the new company instead of forty as before.

The southern section has been laid out by Sir Douglas Fo and Mr. Francis Fox. Its most important part has, of course been the terminus. The last two miles are half tunnel o covered way, but only two tracks have been made, though th railway owns the adjoining freeholds and is quite ready to pu down more lines when they are required. To find ground fo the terminus the company had to buy up two squares and mor than twenty streets, but an easy access has thus been provide to its station. Three tunnels with seven pairs of rails pas under Lord's Cricket Ground, and after emerging at St. John' Wood Road they are increased, till on the bridge over th Regent's Canal there are eleven lines of metals. The coa depôt at Carlisle Street has special provision made fo it, and it is a remarkable fact that, though this hold 300 trucks, it has already proved too small, and is t be doubled in size. The goods yard is completed an

tains one of the largest sheds in existence, with a floor ce of over eleven acres. The company made a new street ning east and west from Park Road to Lisson Grove, and it etween this new street and the Marylebone Road that the senger station has been built. The terminus is on the et level, and is masked by the buildings of the Great ıtral Hotel, though with a road 90 feet wide separating m. The station buildings have a frontage of 325 feet, upied with the usual offices, and behind these will be what y be called a circulating space 253 feet long by 100 feet e. At present the terminus is only half the size originally nded, containing only five pairs of rails instead of fourteen, no doubt the extension will come about, and the company ıs the property in Blandford Square to make it possible at time.

The route of the new line as far as Quainton Road is well wn to most Londoners. The company had to break fresh und from that point till the line reached Rugby, forty miles ıty. No great engineering difficulties had to be encountered, the work was by no means light. The ground is of a ing character, and comprises an important watershed—in , the sources of the Leam, the Nene and some of the head ings of the Thames are included in this portion of the route. e first station after leaving Quainton Road is Calvert, named r the Verney family, and then the line reaches Finmore tion, in Oxfordshire. Brackley, the next station, is an old ough, enfranchised as far back as the reign of Henry II. ised to return two members to Parliament, but its glory has departed. Then come Culworth, Helmdon and Woodford, ere there is a junction, sorting sidings and locomotive sheds. m Charwelton to Willoughby, some seven miles, the work heavy; the gradient all the way is about 1 in 176, and e viaducts—one at Willoughby with twelve arches, verton with eleven and Catesby with eight—were necessary. r Catesby is the only tunnel before Rugby is reached; passes through the hill for 3,000 yards, and is 500 feet ve sea level. The Rugby station of the company is in lmorton Road, and is reached from Willoughby partly ough a huge cutting two miles long, from which 1,250,000 ic yards of earth were taken. Beyond the station the line ses over a viaduct 300 yards in length, built on a curve, with entle gradient, and consisting partly of girder spans of great and partly of brick arches. This was necessary in order to y the line over the London and North-Western Railway and Oxford Canal, and it may be mentioned that all the work had to be completed without interrupting the constant traffic going on below for a single moment. The company were under heavy penalties not to damage or stop the traffic on the canal, which is on an embankment, and the engineers, as a measure of precaution, laid down in the canal bed a long steel trough of the width of the canal, so that even if the banks gave way under the operation of sinking the viaduct piers the water of the canal would not escape. The precaution in the end was not required. There are in all nine stations on this section.

From the crossing of the Oxford Canal the northern section is entered upon, Mr. Edward Parry, of Nottingham, being the engineer for this portion of the works. The line proceeds by way of Lutterworth, Ashby Magna and Whetstone, and has one gradient of 1 in 176 in its course. In Leicester the company had to build a new street and carry the railway at a high level, the northern approach being over a viaduct more than a mile long. From Leicester to Swithland the line is normal, and large sidings have been constructed there, but on leaving Swithland another viaduct through the new water reservoirs of the Leicester Corporation was necessary. The next station of importance is Loughborough, where the Midland main line is crossed, and so by way of East Leake and Ruddington to the Trent, which is bridged on three girder spans of 110 feet each, carrying four lines of rails. The line is now practically at Nottingham, and that town, valuable as its traffic may be, has given the company's engineers sufficient cause for the exercise of all their ingenuity. Arkwright Street station is temporarily one of the chief stations of the line, and great space is at this point devoted to goods sidings, locomotive and carriage sheds, and the like. From Arkwright Street the line is a tangle of tunnels and viaducts. The west end of the Midland station is crossed on a girder span of 170 feet long, and there are in all 1,000 yards of viaduct till the first junction with the Great Northern Railway is made. The two companies are building the Central Station jointly, and it will cover 12 acres of ground. The cost will not be far short of a million. To reach the site from the south some of the busiest parts of Nottingham were tunnelled, and it is in the heart of the town. A tunnel three-quarters of a mile long leads to it on the northern side. Carrington is the first station on the north, and then Sherwood Rise is burrowed under for 600 yards, while a little further on is the second junction with the Great Northern Railway. Ten miles from Nottingham is Annesley, where the old system of the Manchester, Sheffield and Lincolnshire terminated.

P. A. GILBERT WOOD,
IMPERIAL BUILDINGS, LUDGATE CIRCUS, E.C.

THE INSTITUTION OF JUNIOR ENGINEERS.

On Friday, February 10, the chairman (Mr. Basil H. Joy) presiding, the Institution held at the Westminster Palace Hotel a joint meeting with the discussion section of the Architectural Association, when a paper on "Factory Design" was read by Mr. J. H. Pearson, a member of both societies. It dealt chiefly with the requirements in the design of factories for London and its vicinity.

In introducing the subject the author insisted upon the importance of a close relationship between the architect and engineer, as it was only by consultation together and united action, especially with regard to buildings of the factory class, involving the employment of machinery, that a satisfactory result could be arrived at. The sections of the London Building Act, 1894, which had special reference to buildings of the factory type, were touched upon, and the different kinds of buildings were classified. It was shown how the design and construction were affected, not only by the character of the machinery to be installed, but also by the form of power adopted for driving it. Systems in use at the present time were briefly reviewed, preference being given to electricity.

In considering the question of elevation, the good architectural effect obtained from the use of parti-coloured bricks was indicated, and the opinion expressed that stonework should be sparingly introduced, on account of its inability to withstand an excessive heat should a fire occur; its employment should be confined to copings, window-sills, strings and steps. Materials of construction were then considered, a number of specimens being exhibited to the meeting. Referring to foundations, wherever the nature of site-subsoil was at all doubtful a continuous bed of concrete over the whole surface was advised, as by that means a uniform pressure of the loads upon the foundations was secured. Fire-resisting floors and staircases having been discussed, the author proceeded to consider details for the construction of roofs, partitions, windows and skylights.

Furnace chimney-shafts received attention at some length, as did also the questions of ventilation, sanitation and fire-protection, with special reference to the Factory Act of 1895. The construction of a factory with which the author had been associated was described and illustrated, and an interesting account given of the method of putting on an additional top-floor, without meanwhile interrupting in any way the business ordinarily carried on, and without taking to pieces the existing roofs, which were raised by screw-jacks.

An animated discussion ensued, in which Messrs. H. Ga butt, P. J. Waldram, J. Pearson, T. C. Morewood, H. Stathar W. Worby Beaumont, H. C. Reid, H. J. Leaning, H. J. Youn E. A. Berry, Max Clarke and W. R. Beckton took part, ar the proceedings terminated with a vote of thanks to the autho

It was announced that the Institution would hold a co versazione on Saturday, March 11, and that at the ensuir meeting a paper on "The Direct Production of Electricity fro Carbon" would be read by Mr. W. R. Cooper, M.A M.Inst.J.E.

PATENTS.

The Architect.

THE WEEK.

DURING the past week the thoughts of men throughout those parts of the world which the telegraph can reach have been turned to the Elysée, where the latest tenant was lying inanimate. M. FAURE was preceded by a strange variety of occupants, although the palace is not two centuries old. The Comte D'EVREUX ordered its construction, and it was at first called after him. MOLLET was the architect. Madame DE POMPADOUR afterwards purchased the house, which was considered to be one of the most charming in Paris. After her death her brother, the Marquis DE MARIGNY, the director-general of buildings, obtained possession of it, and he had it enlarged. In the middle of the last century there was a need of a building in which ambassadors who came on temporary missions could be accommodated. LOUIS XV. considered the Hôtel d'Evreux was suitable for that purpose and purchased it. Next it was utilised as a storehouse for the royal furniture until the Garde-meuble was completed. DE BEAUJON, the court banker, bought it in 1773, and it was altered and decorated under the direction of BOULLÉE, who was one of the fashionable architects of the time. LOUIS XVI. secured the proprietorship in 1786. In 1790 it became the property of the Duchesse DE BOURBON, when it was called the Elysée-Bourbon. A couple of years afterwards the Republic utilised it for a printing office, and in 1800 it served for public fêtes. The dashing cavalryman, JOACHIM MURAT, contrived to secure it in 1803, but in 1808 he was appointed King of NAPLES by his brother-in-law, to whom it was assigned. It was a convenient palace for NAPOLEON, and it was altered to suit his special requirements. There was a salon de travail which pleased him, and in it he signed his abdication after Waterloo. NAPOLEON made way for WELLINGTON, who inhabited the palace during his residence in Paris. ALEXANDER of Russia was also a tenant. At the Restoration it was presented to the unfortunate Duc DE BERRI, who was assassinated in 1820. The Duchesse and her son, the Duc DE BORDEAUX, resided there until the revolution of 1830, when the palace became national property. It was used as a public office after the fall of LOUIS PHILIPPE. LOUIS NAPOLEON selected it as his residence prior to the Coup d'Etat, which was there concocted. It was enlarged more than once during his reign. The destruction of the Tuileries caused it to be adopted as the residence of the President, and in twenty-eight years the Elysée has had no less than six of that class of tenants.

THE French have lost an excellent deputy by the death of M. MONTAUT, who represented Seine-et-Marne. He was an old polytechnic student, and as a civil engineer had risen to the highest grades of the Ponts et Chaussées. In the Chamber he generally confined his attention to measures on which he was possessed of knowledge, and, as professional politicians do not care to trouble themselves with prosy subjects, M. MONTAUT could be said to have a monopoly of all proposals connected with public works. Long ago he was one of RACHEL'S most devoted friends, but he once incurred the ire of the tragédienne in the simplest way. She lived in the Place Royale, but as a speculation was eager to erect a house in the more modern Faubourg Saint-Honoré, and asked M. MONTAUT for a plan and estimate. He excused himself on the ground of being an engineer and not an architect. His refusal brought him the following reply, which is characteristic of the capricious tyrant:—"You will never make me believe that a man who is competent to construct bridges, canals and what not, is unable to build a house. Engineer and architect are one, at least for those who have good-will. You have it not, or at least will not show it in my case." M. MONTAUT accepted the rebuke, but he was not to be persuaded to try his hand in architecture. There are few engineers who would have the courage to be so modest under similar circumstances.

IT is intended to hold a meeting at the Mansion House on Monday, March 6, to further proposals for the National Commemoration of the Millenary of ALFRED THE GREAT. The king is believed to have died in October 901. Some time ago it was resolved to celebrate the thousandth anniversary of his death by a national commemoration, which should include the erection of a memorial in Winchester, where so large a part of the king's life of fifty-three years was passed, and where some of his dust may still remain. Subsequently it was decided that the memorial was to be a statue of ALFRED, and a museum devoted to early English history. Another suggestion related to the publication of a book about the king, and an exhibition of objects which would recall the period when he lived. It was estimated that at least 30,000*l.* would be required for the memorial. The meeting which is to be held in the City on March 6 it is hoped will advance the project. Although ALFRED'S name is one of the most familiar, and stands out from the darkness of English history like a star, yet it is an advantage for the living to have before their eyes some material acknowledgment of the great chief who was an embodiment of all that was best in the character of the Saxon race. ALFRED was compelled to live in a house which, like many others in that age, did not possess closely-fitting windows and doors. The wind therefore was able to make his candles burn more quickly and irregularly than His Majesty had anticipated when he adopted them to measure the hours of the long evenings, and he was compelled to devise horn lanthorns. The Saxon builders were no doubt at fault, but is that a reason why architects should be excluded from the committee, although representatives of many other arts have a place on it?

A FEW weeks back we referred to the discovery that sections of the new sewers in the Rue de Rivoli, Paris, were not constructed in the manner prescribed in the specifications. The contractor, as became an honest man, endorsed the charges, and admitted that the workmen had deceived him. In defence he explained that the works had to be carried out with expedition, for thoroughfares like the Rue de Rivoli cannot be closed against traffic as easily as a London street. Under such conditions it was difficult to exercise the strict superintendence which was necessary. The men availed themselves of the opportunity to gratify their dislike of a contractor. It has been arranged that every part which has been found defective by the municipal engineers will be reconstructed. The men have the satisfaction of knowing that money will be wasted through their misconduct.

THE people of the Philippine Islands have devised a kind of building which is well adapted for a place which is subjected to earthquakes and typhoons. If the houses should succumb to either of those forces the inmates are not injured, because the materials are too light to cause fractures of bones. The houses rest on four or more heavy timbers which are firmly set in the ground. The floor is raised some 5 or 10 feet. The framing is of bamboo tied together with rattan. Nails are not used. The sides and roof are usually of palm, and, Professor WORCESTER says, the former may be made by splitting green bamboo, binding the halves flat, and then sewing them together. If palms are scarce, the roof can be thatched with long grass. The floor is usually made of bamboo strips with the convex side up. They are tied firmly, in such a way that wide cracks are left between them. The houses are entered by ladders; in some cases there is only one room, and the cooking is done over an open fire built on a heap of earth in one corner, and as the opening for the exit of the smoke is inadequate, the room is sometimes rendered almost uninhabitable. In the better classes of dwellings the house is divided into several rooms, and there is a place partitioned off for cooking. There are windows which are provided with swinging shades. The ventilation is perfect, and the air is kept much cooler than in a tightly closed building. Rich natives sometimes build houses of boards with galvanised iron roofs and limestone foundations, which are more expensive but less comfortable than the ordinary dwellings.

THE SPIRAL IN ORNAMENT.*

THE spiral tendency of vegetation is often referred to by EMERSON as exemplifying one of the principles of life. Nature does not always adopt the shortest course between two points, but attains its end occasionally by following a roundabout route. The straight line is not of much avail in producing the effects we see around us; minerals may be said to have the monopoly of it. Mr. BLOUNT'S book is inspired by spiralism. According to him, "The spiral is the simplest representation of the force that not only governs the huge ordering of the elements, but weaves itself inextricably into the actual shape of the humblest and noblest possessors of life; it is, in consequence, the first and most common symbol of energy and life, and therefore the clue to all true design." The book not only explains the advantages of the clue, but may be said to do so in a spiral manner. About 250 quarto pages are occupied with such elementary subjects as leaves, buds, ends and corners, diapering, frames and bordering. Evidently the author found pleasure in working out the relation of the spiral to various decorative elements and arrangements; it is his governing idea, and, like all zealots for ideas, he cannot, to use a common expression, make enough of it. We imagine Mr. BLOUNT to be an amateur who is able to enjoy himself as long as he likes, and it is a delightful occupation for one's leisure to add fancy unto fancy as a tribute to a favourite subject. An amateur craftsman would in the same way devote a long period of his existence to the production of a simple object, and be happy throughout. Indeed, it appears to us that the reformers who believe the new race of craftsmen are destined to set up a world that is out of joint on a firm basis entirely ignore all that can be represented by the words time and money. That would be a desirable Utopia where neither represented hard work, but as unattainable as the Neapolitan GONZALO'S :—

> Riches, poverty,
> And use of service, none; contract, succession,
> Bourn, bound of land, tilth, vineyard, none;
> No use of metal, corn, or wine, or oil;
> No occupation; all men idle, all.
> And women too, but innocent and pure;
> No sovereignty.

An ordinary designer would expect an ordinary author to impart all the information which is enveloped in Mr. BLOUNT'S book in a tract of one-tenth the size and at a tenth of the cost. But those for whom he writes, and who cannot resemble the ancient craftsmen who preferred acts to words, will probably regret that the convolutions of the spiral are not exhibited at still greater length. Readers of "Arbor Vitæ" should, in fact, be independent of all the sordid interests which are supposed to belong to modern business, and be able to meditate upon each page as if they formed

> A little Academe,
> Still and contemplative in living art,

and alone were destined to be heirs of all eternity. We are afraid we cannot, with the aid of all our imagination, soar so far above a commonplace world, and therefore it is possible we may be unable to do justice to Mr. BLOUNT'S work.

The spiral, as we have said, dominates all the author's speculations. Apparently this arises not merely from observing the prevalence of curves in natural objects, but from an aversion to precision. "Great art," says Mr. BLOUNT, "is not necessarily accurate." But if that were true why should all great artists be distinguished by that infinite capacity for taking pains which is supposed to be a characteristic of genius? Mr. BLOUNT'S theory is an amateur's theory, and will be taken as an axiom no less than an excuse by pretentious GOWANS, who have "sauntered into the arts at a leisurely Pall Mall pace." Esteeming accuracy so little, it follows that he should underrate right lines and planes. According to him, "All really straight line work has to be done with rulers, and is therefore geometrical, unnatural and inartistic. The zigzag moulding of a Norman arch owes its charm to a naïve rejection of all mathematical assistance, and becomes hopefully curved at the angles. It is consequently more an example of an extreme form of spiral than a demonstration of the æsthetic value of straight line." The Norman masons knew better. The intrados and extrados of the semicircular arch became more emphatic through the contrast with the zigzags. A glance at the plate of the north porch of Durham Cathedral which we published last week will reveal the variety of straight lines in other forms which were employed for the sake of effect. If Mr. BLOUNT could rise beyond diapering and bordering, he would find that the greatest modern decorators in France in their monumental paintings have faithfully held to the Norman tradition, and introduce right lines in order to display the force of contrast with the curves of figures and draperies. Let tyros in decoration become the law-givers, but at least make it apparent how far they have departed from precedents. The straight line was used by Greeks and Goths. It may seem an easy matter to make the angles of zigzags as sharp as if two pieces of tin were placed together, but when we remember the rudeness of Norman tools the wonder is how they attained so much sharpness of line. "A mathematical pattern is always a bad pattern," says Mr. BLOUNT, "bad because uninteresting." If his dictum be accepted, Egyptians, Greeks, Moors, Byzantines, and Italian artists must be condemned. They did not derive their inspiration from geometry alone, but they employed rigid lines, especially in architectural decoration, as a foil to those which were more flowing.

We have no partiality for triangles, squares, stars, polygons or similar figures as elements of decoration, but as in the old days they were employed by able masters, we see no reason why they should now become obsolete because amateur craftsmen are put out by them, especially when they attempt the decoration of pottery. It is only a narrow conception of ornament which would confine its varieties to curved lines. In the arts straight lines are generally unavoidable, for even in pottery the mouldings appear to be bounded by them, and they prevail in metal-work, furniture, &c. We grant the curve is more beautiful and more in keeping with natural objects, but utility is not always to be obtained by man unless he is satisfied with planes which may be described as made up of straight lines.

Although Mr. BLOUNT appears as an enemy of anything approaching a rectilinear figure, it must not be concluded that he is an advocate for the mere imitation of natural forms as ornament. He will not allow nature to be subjected to geometrical conventionalising, but a process of presenting nature in an inaccurate manner is to him essentially decorative. Thus in one place he writes :—

> I do not know whether it is the belief that they are painting real things, or merely the fascination of recording an ephemeral impression, that induces modern artists of the realistic school to desert the traditions of the past and aim more and more at the exclusive imitation of nature; but whatever the cause may be, signs are not wanting to-day to show that art, and the happiness and peace that art brings, can no more be found in the exclusive investigation and record of natural facts than the secret of life can be discovered by sacrificing the lives of innocent animals that we have made dependent on our kindness. Art that is based solely on the imitation of nature is unprincipled art, because principles do not exist in nature but only in the human imagination. Traditional art is delightful and permanent, because it is an imaginative statement of the laws of nature. To copy nature is at best only to give an instance of the working of those laws, never to state them. A picture is valuable as a work of art precisely for the amount of imagination it embodies, for the amount of untruth it contains for the nonsense of it, not the sense. All systems of tradition regard the imaginative expression as of the primary importance and only admit natural facts so long as they do not interfere with that expression. The study of nature is indeed a valuable one, but not as a final form of art; its object is only to increase our experience and feed our imagination.

In the same spirit Mr. BLOUNT would treat artificial forms. He sees a resemblance between an architect's arcade and a row of "pot-hooks and hangers" in a child's copybook, and for decorative purposes he considers the latter the more suggestive. He says that "if we want to paint arcades on our parlour walls, it won't hurt anybody if a column here and there leans a little to one side." I

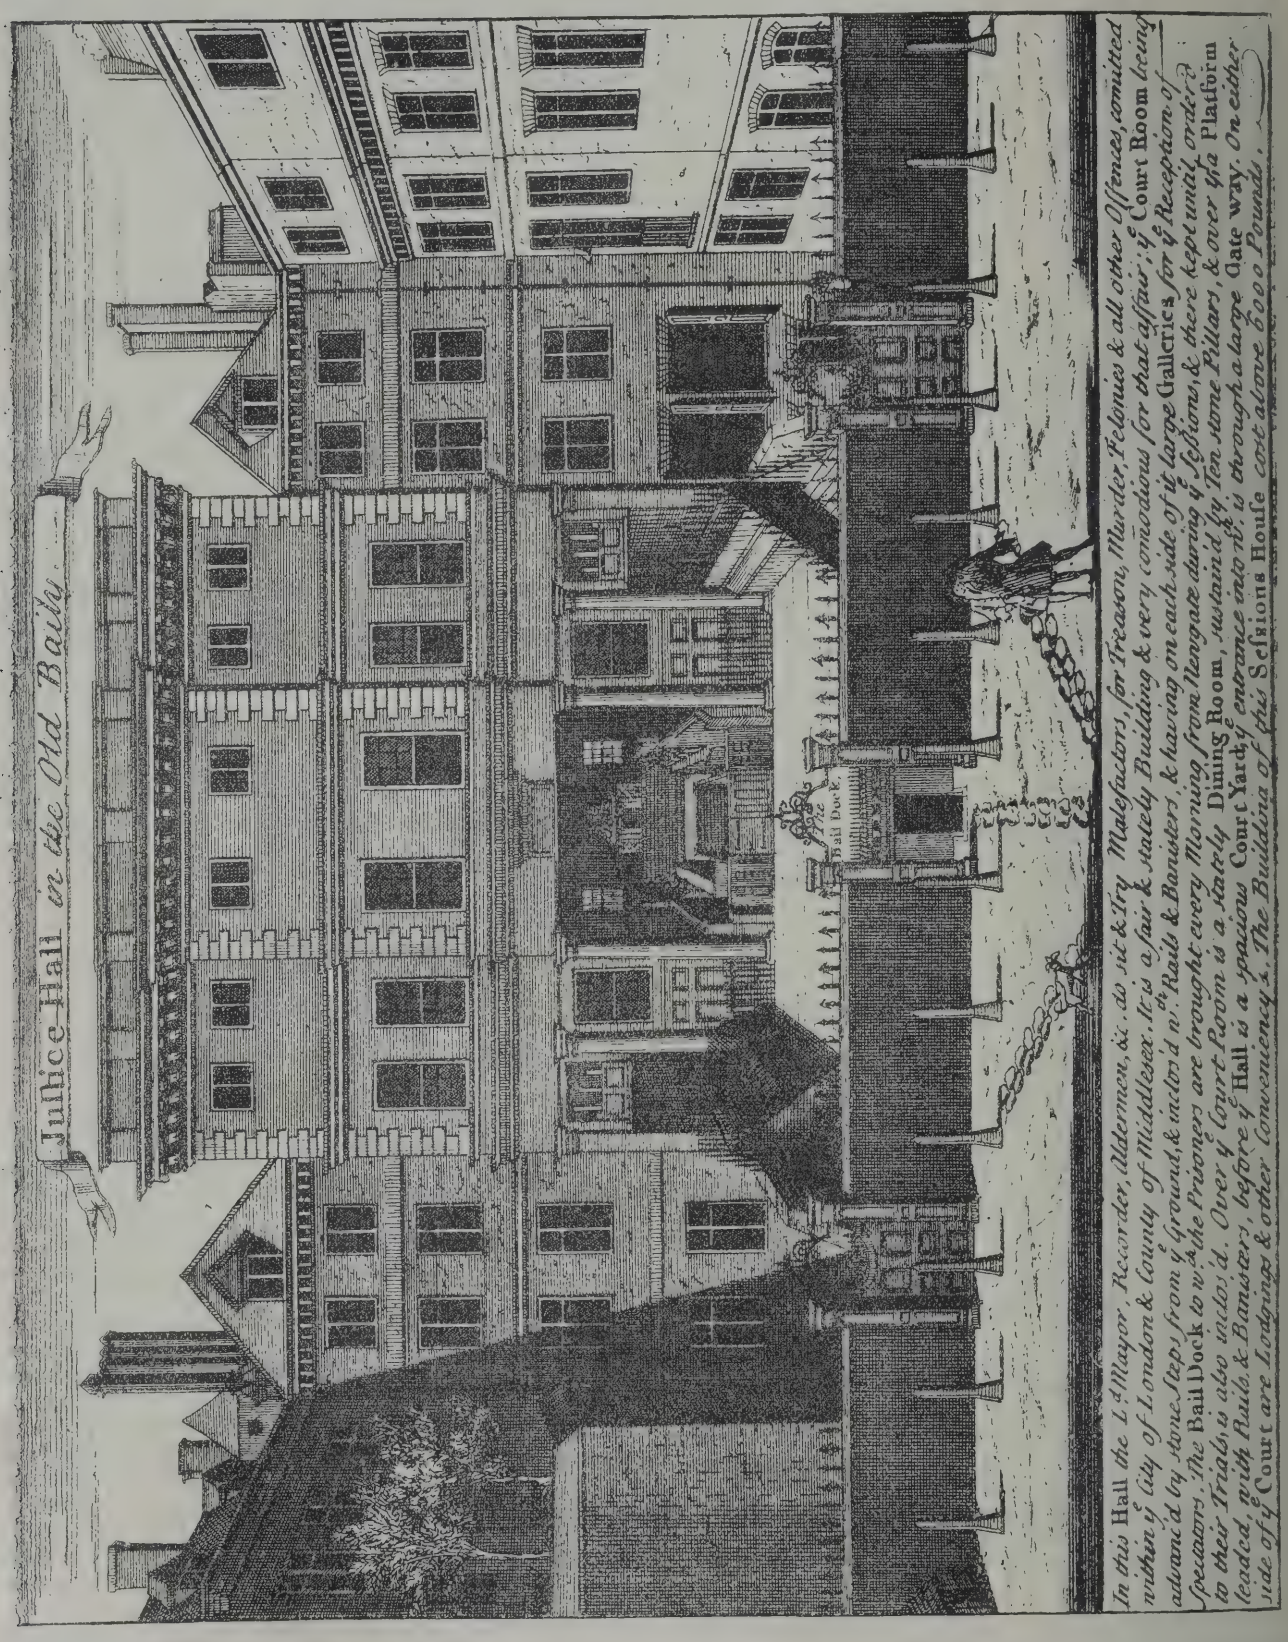
* *Arbor Vitæ*: a Book on the Nature and Development of Imaginative Design for the Use of Teachers, Handicraftsmen and Others. By Godfrey Blount. London: J. M. Dent & Co.

early days a weakness of that kind might be tolerated, but at a time when the majority of folks are more capable of judging perpendicularity than subtle curves, we do not agree that they would be unhurt before one of Mr. BLOUNT's paintings of a row of columns. The aim of art is to please, and men or women not suffering from defects of vision and possessed of reason, who can find more enjoyment in gazing on a lop-sided form than on one that is upright, must be ruled by an odd system of æsthetics. Moral obliquity, we suppose, does produce a hankering after such things; but is it wise for artists or craftsmen to gratify the weakness? To anyone who is following out relations between things the arcade suggests the grove, and then a crowd of associations arise. Mr. BLOUNT's are those of a poet. He says :—

This bit of witchcraft is especially characteristic of the arcade and the class of ornament to which it gives its name. It is not such a noticeable feature in the spiral, because it is difficult to say what the repeating part of the spiral exactly is; nor in the frieze, where the conditions are quite different. No wonder, then, that mystery envelops the places where this occurs in a marked manner in nature, and enhances the eerie charm that wraps our entry into the deepening gloom of a wood. The eclipse of noisy day by silent shade, the change from the vulgar heat and dust of the high road to cool carpets of elastic moss, and the impression of awful, half-seen companionship, amply explain the time-honoured sanctity of groves and the lovely paganism that always clings to them. What harm attends one innocent of superstitious reverence in such temples as these, not made with hands, for those "groves and streams and mountain summits which bring the unseen close to man by waving mystery, or by rushing murmur, or by nearness to the height of heaven"? To reject sentiments of this sort, however pantheistic, is to despise the subtlest sources of our inspiration. What may once have been superstition is none the less wonderful and valuable for us when it has consciously become a prolific source of poetry. Art can never be based on enlightened scepticism; nor any science, I trust, expel the lurking ghosts which haunt our fields and teach us to be grateful for their beauty, and kind to the animals and flowers that grow there.

There are people who in certain moods can, it is said, see "HELEN's beauty in a brow of Egypt," and to emotional craftsmen a series of pothooks and hangers scrawled by a child may become as worthy of reverence as the Grove of ACADEMUS. It happens, however, that few architects possess clients so easily disposed to accept things by their unlikeness to the objects represented, and as long as they are so restricted they cannot favour arcades that are more suggestive of the action of an earthquake than of ordinary stability. It must not be supposed from Mr. BLOUNT's remarks about painted arcading that he is indifferent to the claims of architecture. The excellence of the sculpture of the Parthenon he ascribes to the recognition by the artists of the duty of subservience to structural necessities. He also objects to the practice of the new school of wood-carvers who have no respect for the constructive value of the material, and whose carving robs the timber of its strength. But he is not always consistent in observing the difference between construction and the means for adorning it. We consider Mr. BLOUNT is sincere, although his teaching does not satisfy us. He has assumed the manner of missionaries, and is not economical of time in his harangues. What he says may help to pass the hours, for it would not de difficult to find less interesting books; but when all is over the gain does not appear to be immense. If the few subjects which are treated require such an expenditure of words, what would a complete treatise on decoration in the same style amount to? A student would have to be as long-lived as the Patriarchs to get through it. But, however colossal might be the treatise, Mr. BLOUNT believes it would not be of much avail, because we are all among those who have eyes and see not. He tells us how

a reformation in manners must precede a reformation in art, and, till we clear our lives from the thousand trivial things that baulk our truer culture, our ideas on art will remain anarchic. That group of traditions, for instance, which clusters round the "Table," and of which the Last Supper is the central type, can have no significance for us till our meals become the punctual refreshment of a household in its daily labour, hallowed by hunger, hospitality, spotlessness of plate and linen, good food, good cooking, and a suitable acknowledgment of the sacredness and mystery of food. The pursuit of game is a noble theme so long as the sportsman's dinner depends on his success, and while the advantages of healthy outdoor exercise and the beauties and science of wood and water-craft surmount the butcher's trade. But all the beautiful accessories of the chase and the strange acquaintance with and appreciation of the wild animal life it dealt with, which takes such a prominent position among artistic traditions, has vanished before the gun, and its cruel sacrifice of life to the size of the bag. And so it is with other traditions that were once real and true because they were founded on the necessities of life, and illustrated as far as they could its unity. To hint that decoration could have any such meanings now is perhaps hopelessly out of date. Nothing, apparently, is further from the thought of modern decorators than that their efforts should, however indirectly, lead anybody to feel and *think*. To the artist art has no higher mission than to earn the praise of the public, as a mountebank does, by tickling it with clever and unexpected surprises, legerdemain and optical delusions. Art as a social force is dead, because it has no faith to preach, no gospel to proclaim.



In other words, art is dead because it will not accept the creed of lop-sidedness and inaccuracy. Usually reformers content themselves with laying all the blame on artists, but Mr. BLOUNT has the courage to include patrons in his indictment. That sort of charging is somewhat pharisaical. What we should like to see are examples of the art which proclaims, however faintly, the new gospel. We must do Mr. BLOUNT the justice to say that he does not in clear words assert that his own designs exemplify the pure, the revivifying, the beautiful in art, while at the same time they hardly tickle by any surprising cleverness. He admits he once endeavoured to indoctrinate a boy with his principles, but was not successful. The young artist instinctively turned to patterns of a different sort. Was the weakness due to the age, to the modern system of art, to the weakness of human nature, or to the master? Although the "Arbor Vitæ" has required much labour to rear, we fear it will not yield many thriving saplings. But there need be no apprehension the species will die out. Rods will always be forthcoming for the correction of artists, and they have reason to rejoice that their calling, with all its defects, can offer some alternating consolation.

THE JUSTICE HALL OF LONDON.

AT the present time the future Sessions House for the City of London and the surrounding area is engaging the attention of architects who probably never gave the subject a thought in an earlier time. The existing building is not only mean within and without, but it is badly arranged according to modern notions. But its predecessor appeared to be still less adapted for a court of justice. The annexed illustration is taken from an old print belonging to Mr. THOMAS DREW, R.H.A., and reveals many peculiarities. Although the court was too open, yet it was not safe against infection, and, as CHARLES DICKENS says, "It had more than once happened, that the judge in the black cap pronounced his own doom as certainly as the prisoner's, and died before him." But to the novelist the open court had another signification, for in a bitter spirit he adds, "People then paid to see the play at the Old Bailey, just as they paid to see the play in Bedlam—only the former entertainment was much the dearer. Therefore all the Old Bailey doors were well guarded—except, indeed, the social doors by which the criminals got there, and those were always left wide open." Any gentleman of position was allowed to wear his hat in the court. When the engraving was made the chief attraction to respectable citizens was not the court itself, but the stately dining-room sustained by ten stone pillars. It recalls the poet's line, "And wretches hang that jurymen may dine." PEPYS testifies to the goodness of the dinners and the discourse in that room.

The view shows the building which existed from the rebuilding of London after the Great Fire until the GORDON Riots. If the bail dock does not seem to be a secure place for prisoners, we must remember there was much laxity co-existing with the severity which was a characteristic of the Old Bailey. It was not uncommon for prisoners to escape, and according to PEPYS, the keeper's house was "the only nursery of rogues, prostitutes, pickpockets and

thieves in the world, where they were bred and entertained and the whole society met, but for the sake of the sheriffs they durst not commit him, for fear of making him let out the prisoners." In prison administration there has been some progress since those days, and the new Old Bailey, whatever defects it may possess, will at least be secure.

SYSTEMS OF DISTRIBUTING AND GENERATING ELECTRICITY.

By F. J. Warden-Stevens.

(*Continued from page* 93.)

THE auxiliary plant and apparatus connected with boilers may be classed as follows:—(1) Feed-pumps, (2) feed-heaters, (3) water-supply arrangements, (4) steam-pipes, valves, &c. Condensing plant, although it is really more directly connected with the engines than boilers, should perhaps be included also.

Feed-pumps.—There are many designs of feed-pumps, and it is impossible to go very fully into the subject here. However, the class most used is the duplex direct acting type. In these pumps there is no rotating part, but the steam piston acts directly on the pump-plunger. There is usually a very ingenious valve gear which admits the steam to No. 2 cylinder when No. 1 piston is at a certain position of the stroke. The speed of this pump is arranged to increase with the amount of water delivered. The fault of this type is that the steam cannot be used expansively, and it is therefore uneconomical. There are, however, pumps which, although direct-acting, have a flywheel; these allow

of expansive working, and the reliability of the arrangement s nearly as great as with a duplex pump. There are many forms of flywheel pumps and donkey pumps in general, but there is no doubt that, taken as a class, they are uneconomical. If pumps can be driven directly from the engine-shaft it is undoubtedly to be preferred. It is unusual to obtain a duplex or donkey pump which uses less than 80 lbs. of steam per actual horse-power hour, whereas by driving from the engine-shaft 25 lbs. of steam is about the outside consumption. The water is hot when it passes through the feed pumps, and may cause strokes to be missed, but several types of pumps work well with hot water, and in any case by allowing a slight head of water on the suction there is little, if any, trouble through missed strokes.

The use of electric pumps is being introduced rapidly into electricity works on account of their greater efficiency. The following figures show a comparison actually made between two pumps, one an electric three throw pump, and the other a duplex steam-pump of the highest class:—

Per Cent. of Full Load.	Pounds of Steam per Actual Horse-power Hour.	
	Electric.	Steam.
20	73	250
50	50	205
75	40	170
100	43	130
130	50 (about)	100

It is to be seen from these figures that the electric pump is much more economical at all loads than the steam pump. Electric pumps are hardly as reliable as steam, and for this reason, when they are adopted, it is not unusual to have injectors as a stand-by.

Electric pumps cost considerably more than steam-driven ones, but there are many advantages obtained by using them, for example, in the case of electricity works where the continuous current system has been adopted, and also in other cases when there are accumulators, in being able to pump when there may be no steam available. This advantage may fairly be said to compensate for extra expense.

Injectors are now very well known, and with care are fairly trustworthy. As there are no moving parts they are not likely to get out of order when left unused, and for this reason they are suited for stand-by use. The injector will not work with very hot water, and therefore they are not in general use in electricity works, where much importance is attached to hot feed water.

Feed-heaters.—There are two chief classes of feed-heaters using exhaust steam for non-condensing plant—those in which the steam actually mixes with the feed water, and those in which metal tubes are interposed between the steam and the water to be heated. In the first class, if properly arranged, the carbonates are deposited in the heater, and nearly the whole of the heat returns to the boiler, therefore only a little cold feed water is required. There is the disadvantage that the oil used for cylinder lubrication comes through with the exhaust steam, and may thus enter the boiler and cause trouble. Arrangements for separating the oil from the steam minimise this trouble considerably. One of the chief advantages of this type of heater is to be found in the fact that the deposits formed do not decrease the efficiency, but actually increase it by acting as lagging.

The second class of heater is less efficient, more costly and less certain. A large number of tubes are used which in some cases are surrounded by the water, the steam passing through the tubes. In this type the whole of the condensed exhaust steam is wasted, and the specific heat in it is not used. These heaters are generally placed between the pump and the boiler, and thus work under pressure, therefore there is always a danger of the tubes bursting. Any deposits in the heater decrease its efficiency, which is fairly low in any case.

The benefits of hot-feed water are so marked that it is often found economical to actually use live steam for heating the water outside the boiler rather than pump in the cold water. The directions in which economy is to be obtained are :—Longer life of the boilers owing to absence of strains caused by differences in temperature in different parts, a larger output from a given sized boiler ; a considerable reduction in the quantity of deposit formed in the boiler, and therefore less frequent cleaning and greater efficiency, and, where exhaust steam is used, a clear gain of heat which might otherwise be wasted.

Water-supply Arrangements.—It is always preferable, even at the expenditure of some considerable capital, to obtain water independent of any public supply; but the public supply should be laid on where possible in addition. Very often subsoil water can be obtained more suited for boiler feed purposes than that of the public supply, which latter has to be free from sewage contamination, and may in consequence be hard if obtained from deep wells.

It is necessary in either case that some large tanks be provided in which to store sufficient for at least one evening's demand, and where water is obtained from a public supply special arrangements should be made to have the pipes connected to two different sets of mains—the ordinary service and the fire service—and also to make arrangements to have long notice of any stoppage of supply, so that tanks may be filled up and everything kept ready.

It must be remembered that, if possible, electricity works should be alongside a canal or river, and a wharf is of advantage. In any case the water can be used for condensing purposes. This is very important where the works are kept running throughout the twenty-four hours.

The importance of the quality of the water to be used cannot be over-estimated, and if it contains any considerable amount of solid matter in suspension or solution it is very necessary to remove this before using it. Solid matter in suspension may be removed by means of filters, and where the public water supply is used this filtration is generally carried out to a sufficient extent at the waterworks. The matter in solution is, however, left, and this must be removed before the water enters the boilers. The various boiler fluids and compositions are not useful to any degree, and it is far better to precipitate the matter before entering the boiler than to precipitate it in the boiler even in a loose mass, as priming results and the heating surface of the boiler is reduced.

Chemical treatments are often used, the object being to introduce chemicals which will combine with the substances in solution and make a compound which is insoluble and will therefore be precipitated. The chemicals to be introduced will depend very greatly upon the result of analysis of the water, and it is impossible to give many details. Lime will, if added in proper quantity and mixed, throw down the bicarbonate of lime which usually forms a great portion of the soluble minerals found in water. Other substances in solution are magnesia, and very often acids from the atmosphere, and the other chemicals usually used are caustic soda and carbonate of soda. It is necessary that these materials, according to the impurities in the water, should be mixed in proper proportions, and that space be allowed for the precipitate to settle before the water is drawn off into the boiler.

The effect of heating water suddenly is frequently to cause the greater part of the substances in solution to deposit at once. In consequence there are in use heaters and purifiers combined in which the feed-water is sprayed into exhaust steam, the result being that the water is at once softened and heated. This method is not suitable where condensing plant is in use, as there is then no exhaust steam available for such purpose. It is important where exhaust steam is mixed with the water direct that a suitable oil-filter be provided to prevent any of the oil used in the steam cylinders from going through with the feed water into the boilers. There are many of these oil-filters on the market, one of the most successful arrangements being merely a vessel filled with coke through which the steam passes. The coke collects the oil, and is replaced periodically.

Water-pipes require careful arrangement and duplication, and they should either be buried at least 2 feet in the ground or be lagged, to prevent any possibility of freezing. A water meter or meters should always be used on the supply; by this means a good check can be kept on the coal which should have been used in a given time. It is advisable to duplicate both the suction and delivery pipes of the pumps, as also the boiler feed valves. These points are of great importance, as of course if water cannot be pumped into the boilers they must be shut down.

Steam-pipes, Valves, &c.—Great care must be exercised

in the arrangement of the steam-pipes, the chief points being reliability, provision for expansion and drainage. It is the usual practice in electricity works to have everything duplicated—that is, to allow two distinct paths for the steam to pass from the boilers to any engine. Valves are also arranged in the steam-pipes between each engine, so that in the event of any burst in a pipe only one engine need be shut down while the damage is repaired. There should be preferably two stop valves admitting steam to the pipes from each boiler. In a great many instances separate pipes are run for the feed pumps and auxiliary plant. In any case it is desirable that this should be done because of the extra security which results. The steam-pipes should not be rigidly fixed to the buildings; it is always preferable to sling them from brackets by means of chains or support them on roller brackets, and where the pipes are in the form of a ring, as is usually the case with electricity works, no further provision need be made for expansion. In ordinary cases of lengths of steam-piping it is the practice to make all bends and tees of copper, as the flexibility of this material allows for expansion. The valves should be carefully designed and all turn the same way to open or close. Much trouble is caused by the stop valves on boilers leaking, and considerable waste of steam results. Valves used for steam-pipes should be of the slide or full bore type, that is, the area should be at least as large in the valve when full open as the area of the steam-pipes. In operating large valves of this kind it is necessary that the steam pressure should be equal on both sides when opening; to secure this and to allow of pipes being heated slowly, by-passes are provided. All steam-pipes, valves, flanges, &c., should be lagged, a removable covering being provided. The losses in steam-pipes are exceptionally heavy in electricity works, as the pipes have to be very large to meet the maximum demand, while the amount of steam used in the engines is on the average small. Lagging is therefore of the greatest importance.

Condensing.—The advisability of adopting condensing plant is now generally considered, and it will be well to go into this question. There are several different types of condensers :—(1) Surface, (2) evaporative, (3) jet, (4) ejector.

A surface condenser consists of rows of tubes into which the steam passes, and around which cold water circulates. The steam is condensed by the heat being abstracted from it and heating the cold water.

The evaporative condenser consists of a set of corrugated tubes, fixed usually in the open air, over which water trickles. The heat of the steam evaporates the water running over the tubes.

A jet condenser is a closed vessel into which water is sprayed, the steam being condensed, and by the direct admixture of water and steam a vacuum is formed.

These three classes of condensers, it will be seen, all require an air-pump, *i.e.* a pump to extract from the closed vessel any air which might leak into it through the engine glands, exhaust or air contained in the feed water, and also to pump out the condensed water.

The ejector condenser does not require any pump, and consists merely of a water jet, which must be under a head of about 20 feet. This jet passes through a special nozzle, and the steam is drawn into it and is condensed. At the same time the energy of the water jet is sufficient to eject any air and the condensed water from the vacuum. There is thus no other apparatus needed than the ejector, which is inexpensive if there is sufficient water available at a head of 20 feet. The advantages of this arrangement are obvious, and in many cases these condensers are the cheapest both in first cost and cost of working.

It may be of interest to give some particulars of the conditions under which the various condensers are used.

The surface condenser is adopted where it is desired to use the condensed steam for boiler feed purposes. This water does not mix with the cooling water, and the latter need not therefore be pure so long as there is a sufficient quantity available and it is cold. For this reason marine engines are usually supplied with surface condensers.

Evaporative condensers are used under the same circumstances as surface condensers, except that they will work with warm water for the cooling purposes and with very little water.

Jet condensers are often used where hot condensed feed-water is not a necessity, and where expense is of importance. This type is, however, rapidly being replaced by the ejector condenser, as the latter is useful for all purposes where the jet condenser may be employed, and the expense of the air-pump is saved and the cost of working less. In first cost the different classes of condensers would be arranged in the following order :—Evaporative, surface, jet and ejector, taking into account the cost of pumps. The order as regards quantity of water used would be as follows :—Surface, jet, ejector and evaporative ; and probably that of total efficiency, taking into account water and cost of working :—Evaporative or ejector, surface and jet.

With regard to the advisability or otherwise of adopting condensing plant in electricity works, it must be remembered that local circumstances will come in, and it is essential to consider them fully. First of all, the use of condensing plant increases the capital outlay and to some extent the cost of attendance. The advantages are a higher economy, which is due to the increased efficiency in the engine cylinders and to the use of the condensed steam for boiler feed purposes where good water is scarce or expensive. Surface condensers are or should certainly be adopted if impure water is plentiful, and the evaporative where there is little water of any kind. As an alternative to the latter jet or ejector condensers may be adopted, using large cooling tanks for the water.

In any case where steam plant is in use for many hours it is economy to adopt condensing plant ; for instance, in electricity works where the alternating current system is decided on, and where plant must be kept running day and night, it is always advisable to have condensing plant at least for that portion running continuously, when perhaps it would not pay to put in sufficient condensing plant for all the engines.

Where condensing water is available in fair quantity and at low cost, or where there are facilities for cooling, it will pay to adopt ejector condensers, one for each engine. As before mentioned, the point which really decides whether condensers should be used, and if so, of what type, is the quantity and quality and cost of the water supply.

(*To be continued.*)

TESSERÆ.

Selection in Painting.

It is not every form in nature which is suited for translation into art. Providence has many other, and perhaps more important ends in view than the making of pictures, and the worthy individuals, men and women, who pass most respectably through the duties of ordinary life, are not one and all necessarily suited to the dimensions of the historic canvas. The great masters knew this full well, and their study of nature took a corresponding direction. They seem to have been guided by certain innate ideas of beauty, dignity and fitness ; to have selected those forms which stood as the exponents of noble thoughts, and at times to have made individual shapes bend to their will. All this, indeed, was the purpose of their repeated and tentative studies. They compiled from various models the collective results for which they strove, they threw out those blemishes or lower elements which marred each individual example, they combined the perfections which were scattered abroad but never concentrated into one focus, and they thus caught at last the perfect idea, the type of beauty, at which nature aims with inconstant step. This, in short, constituted their study of nature ; herein lay their philosophy, and in great measure, in this consists the glory of their art. We know, indeed, of no other basis upon which a noble, historic or sacred style can be formed. Unfortunately, or perhaps for the sake of creative genius, most fortunately, the portraits of illustrious men have been often lost, and the individual characters, in the sacred narrative at least, have in no way been handed down in bodily aspect. It therefore becomes essential that the artist should so study nature that he may reclothe in fitting guise those great men who have been lost to our view. The painters of the Middle Ages did this, and the Grecian sculptors likewise. The portrait of Homer, so oft repeated, is probably ideal. The heads of the Apostles and of Christ, the figures of prophets, and often even of the Christian saints, as painted by Leonardo, Raphael and the other Italian masters are, in fact, little more than the embodiment of the painter's ideas—his mental conceptions thrown into bodily form ; the artist, instructed by his studies, working after the discovered methods of nature, and becoming in turn himself a creator

That alone, in fine, is the true study of nature which enables the painter or the sculptor, in the sphere of his art, to work after the spirit of nature. But it requires a gifted eye to see the poetry which dwells in nature. The remark has been so oft repeated as to become commonplace, yet it remains for ever true that the most ordinary incidents may be turned to deep instruction, and that the forms which are scattered along our daily paths are replete with beauty. Yet it requires, as we say, the intuition of a gifted mind, the cunning of a practised hand, to transmute into the poetry of art the ruder and more hackneyed ways of the outer world.

Augustus Pugin the Elder.

Augustus Pugin was an émigré—one of those virtuous, blameless, painstaking Frenchmen whom the Revolution drove into England, and who, taking kindly to the sober land of his adoption, like so many of his countrymen, pursued thereafter a life of diligent and worthy industry, in utter contrast to the hideous tumult which had cast him forth. It would be an interesting inquiry to discovery how many such, so utterly unpolitical that the fact of their having been driven to these shores by such a whirlwind of social agitation is almost unbelievable, have stimulated and afforded new developments to English industry and laboriousness. Pugin, by dint of a faculty of drawing not much cultivated or remarkable, fell in his penniless and friendless estate into the employment of Nash, the architect, and by degrees became himself a theoretical architect of much eminence and influence, laying the foundation in his careful practical works and in the thorough training of his pupils for all that has been since accomplished in Gothic architecture. It was the age of the Brighton Pavilion and other such monstrous follies in which with souvenirs of Normandy in his heart the quick-eyed Frenchman, with his lively pencil and perception of awakening public interest, took up the vanguard in the new movement. He made the noble remains of former ages familiar to the eye and clear to the mind of the nation, which stirred by many influences, and in the flush of a new outburst of national genius and splendour, began to be doubtful of its own tame mediocrity in point of art. When public taste has come to the length of bursting out into insane bulbs and pinnacles by way of relief from the dead flat of former dulness, such an oracle close at hand is invaluable. The French draughtsman who loved his work, and had no other object in life than its accomplishment, filled his office with pupils to whom he opened a new and fascinating world. Cathedrals and castles, not of stucco, all noble, real, solemn, rose out of the darkness around the fortunate lads who were to reproduce and emulate what they saw. Their master himself reproduced only upon paper, in books that stimulated the general curiosity and helped to mend the vitiated taste which had exhausted itself upon pediments and cornices. They went into France and over England, sketching everywhere, making "examples" of the half-mouldering fragments which otherwise would have been lost to the world, and learning by what simple, splendid constructive art edifices which look like creations grew into being. Within the household where the Frenchman trained his pupils into all the individualities of Christian architecture a kind of Protestant conventual rule existed under his strong-minded English wife.

Edinburgh.

Edinburgh is complete in its stony beauty, whether beneath the autumn sun or white and silent with winter snow. What a poem is that Princes Street. The puppets of the busy and many-coloured hour move about on its pavement; their interest how slight, their pursuits how trivial; while there across the ravine Time has piled up the Old Town ridge on ridge, grey as a rocky coast washed and worn with the foam of centuries; peaked and jagged by picturesque gable and roof; windowed from basement to cope, the whole surmounted by St. Giles's airy crown. The new is there looking at the old. Two times are brought face to face, yet separated by a thousand years. Wonderful on winter nights, when the gully is filled with darkness, and out of it rises against the sombre blue and the frosty stars that undistinguishable mass or bulwark of gloom, pierced and quivering with innumerable lights. There is nothing in Europe to match it. Could we but roll a river down the valley it would be sublime; finer still, to place oneself a little beyond the Burns monument and look toward the castle. It is more astonishing than an Eastern dream. A city rises up before you painted by fire on night. High in air a bridge of lights leaps the chasm; a few emerald lamps, like glow-worms, are moving silently about in the railway station beneath; a solitary crimson one is at rest. That ridged and chimneyed mass of blackness with splendour bursting out at every pore is the wonderful Old Town, where Scottish history mainly transacted itself, while on the other side the modern Princes Street is blazing through all its length. During the day the castle looks down upon the street as if out of another world, stern, with all its peacefulness, its garniture of trees, its slope of grass. The rock is dingy enough in colour, but after a shower its lichens laugh out green in the returning sun, while the rainbow is brightening on the lowering sky beyond. How deep the shadow of the castle at noon over the gardens at its feet, where the children play. How grand when giant bulk and towery crown blacken against the sunset. Fair, too, the New Town sloping to the sea. From George Street, which crowns the ridge, the eye is led down sweeping streets of cold stately architecture to the white gleaming villas and woods that fill the lower ground and fringe the shore; to the bright azure belt of the Forth, with its smoking steamer or its creeping sail; beyond, to the Lomonds of Fife, soft, blue and flecked with fleeting shadows in the keen clear light of spring, dark purple in the summer heat, tarnished gold in the autumn haze, and higher still, just distinguishable on the paler sky, the crest of some distant peak, carrying the imagination away into the illimitable world. Residence in Edinburgh is an education in itself. Its beauty refines one like being in love. It is perennial like a play of Shakespeare. Nothing can stale its infinite variety.

Numismatic Forgeries.
